A BOOM IN BARK.

Something over two years ago the bottom dropped out of hemlock bark and some heavy dealers were driven to the wall. Heavy failures occurred at about the same time in the leather trade, which was kept in an unsettled and unsatisfactory state for months afterwards. The New England tanneries which are the chief consumers of the Canadian bark that is exported were run on a reduced scale, and that with the large stock of bark on hand made the outlook a poor one, and as it has proved kept the price of bark depressed for over two years. But the causes which inevitably bring about an improvement have been quietly at work for some time. The leather trade has picked up and the tanneries beginning to use more bark stock in New England yards have been perceptibly reduced. A few weeks ago there began to be a sharp inquiry for bark and prices began to harden. The fact is there is not a great supply of Canadian bark accessible. The low prices prevented peeling on anything like the old scale. Outside of what is held by Canadian tanners for their own use, the bark in sight in the Province of Quebec does not exceed 100,000 cords and is probably considerably under that figure. The chief holders are Church & Fee, who have about 37,000 cords, and Goodhue, of Danville, who owns from 25,000 to 30,000 cords. The price has gone up with a bound from $4 to $6 per cord and there is a combination to corner the market and kite values up to $8 or $9, and perhaps $10, on the cars here. New England tanners have become frightened and have agents picking up small lots in the hope of being able to tide over the scarcity till they can draw supplies from the new Pennsylvania bark next season, say in July or August. The holders of the Canadian article, which was in the main purchased at a low figure, are in a position to net a handsome profit on their deal and recoup themselves for former losses.—*Waterloo Advertiser.*

LUMBER EXPORT DUTY.

The recommendation for the abilition of the import duty on Canadian lumber into the United States contained in President Cleveland's message to Congress is attracting great attention in the city. It is not the first time by several, that a similar suggestion has been thrown out, but hitherto the opposition of the Michigan and Wisconsin lumbermen, and the interest they can bring to bear on the members of the Legislative Assembly have hitherto proved fatal to the abolition of the tax. In view of the possibility of the recommendation being acted upon, a *Free Press* scribe waited on a number of Ottawa lumbermen, and asked their opinion of the effects of the remission of the duty.

Mr. Bronson, jr., said it will be of great importance in increasing the exportation of the coarser cuts of lumber. The greater parts of the finer cuts are imported from Montreal or Quebec, or to South America, passing through the United States in bond, these would not be affected; the coarser cuts, however, are entirely consumed either at home or in the United States. Upon these the producer here has to pay all charges, freight and duty, and no doubt the remission of the duty would increase the sale of these cuts considerably. Still I do not think the Canadian producers would get the benefit of the whole duty on their price. The duty is $2 per thousand feet, and they perhaps would get the half, and the New York or American importer the other. You must understand that the general run of timber now made is coarser than it used to be. Lumber is made now which would not have been considered marketable years ago, but the pine trees are very scarce, having been first used and therefore the tendency of the lumber trade is towards coarser cuts.

Would the abolition of the duty make vital difference in Ottawa?

I can hardly say, but it is possible it might. Of course, the Michigan lumbermen would oppose it, lest we should cut them in price.

Mr. Pattee, of Messrs. Perley & Pattee, said: "Oh yes, I think it would make a considerable difference. I am not prepared say what difference it would make to Ottawa, but it would produce a boom in all lumber producing towns in Canada."

"The duty is a fixed duty of $2 per 1,000 feet is it not?"

"Yes, it used to be an ad valorem duty, but that was found so confusing the fixed duty was substituted. The duty is the same all along the line. I think it would be a boon throughout the Dominion, and certainly Ottawa would come in for its share."

Mr. Booth was away from the works, but his representative said: "There is no doubt it would make a great increase in the export of the coarser kinds of lumber, and would bring more trade into the city. I would rather not say much about it just now, as I think any sign of hailing the change would stir up the Michigan men to a more strenuous opposition. The duty does not effect the higher class of fine cuts."

"It runs sometimes to 50 per cent. on the coarser, does it not?"

"Nearly 33⅓ and 40 per cent.; yes nearly 50, but I think it would be unwise to say much about it."

Mr. Cushman, manager for Mr. E. B. Eddy, said: "I do not think it will make any great difference; the consumer as a rule pays all charges, and so it does not come out of the Canadian lumberman's pocket; still there might be a division of the amount. If they would take the duty of the manufactured article it would enable Canadians to make up their lumber at home instead of in the States. I do not see that it would greatly effect us here."

Mayor McDougal said: "It would be a great boon to Ottawa, it would increase her trade immensely. There is a class of lumber sold for somewhere about $4 per 1,000, upon which the $2 duty acts as a prohibitive one. It would not effect the trade in superior lumber, but would make an immense difference to the lower kinds."—*Ottawa Free Press.*

DURABILITY OF CROSS-TIE TIMBER.

In an investigation of this subject made by Mr. F. B. Hough for the Department of Agriculture, some interesting facts are brought out. The relative importance of the various kinds of timber for railway purposes are reported in the following order:—Oaks, pines, chesnuts, hemlock, cedars, tamarack, cypress, elms, ash, cherry, black walnut, firs, spruce, beech, locust, redwood, maple, butternut, coffeenut, mulberry, and musquit.

The average durability of oak, as reported in 32 cases, is 7.4 years, while the average prices of each cross-tie is 41.2 cents. The kind of oak is not specified. For white oak the average durability in 152 reported cases is 7.3 years, and the average price in the 173 cases is 40.6 cents. the average duration of a post oak tie is 7 years, and the average price 33 cents. For burr oak, durability, 7.4 years; price, 37.3 cents. Rock oak showed an average durability in 18 cases of 7 years; price 42 cents. In the case of red oak 5 years is the average durability, with an average cost of 27 cents. Chestnut oak is more durable, showing an average lifetime is a tie of 7.1 years, cost, 28 cents per tie. Black oak shows an average durability of 4½ years; average price, 43 cents.

Long leaf or southern pine will last on an average 6½ years; average cost per tie, 37 cents. White pine has about the same durability with less cost, the latter showing an average of 31½ cents per tie.

Cedar shows the greatest average durability, being 1.18 years, with average cost of 34 cents, but is too soft to bear heavy freightage, and for that reason is not much employed in railway construction. Red cedar is more durable than white cedar, being in proportion of 11 to 7. Cypress shows greater durability than white oak, the former showing an average of 8.7 years. White ash and black ash rot very quickly, the former in 4.3 years, and the latter in 3.8 years. Cherry is a durable timber when used as cross ties, running from 6 to 10 years. All woods are much more lasting when hewn than when sawn.

The redwood of California makes very durable ties, lasting over eleven years, but allowance must be made for the fact that they are used on the Pacific road in a dry climate, where the causes producing decay are not so great as in states east of the Rocky Mountains. The growth of the redwood is very slow. Trees 15 years old have a diameter of only 10 or 12 inches, and will make about three ties. When younger than this the wood is not durable. The redwood of the Santa Cruz Mountains furnishes the best ties it being much heavier and denser than when grown further north. The average cost of redwood ties is 40 cents. The total length of railway track in the United States approximated at 150,000 miles. Assuming that the average durability of ties is seven years, and the distance apart is three feet, there will be 2,640 to the mile, which is rather under than over the actual number employed, making the total number in use 396,000,000. Estimating one-seventh to be replaced every year, the annual demand to keep up the present railways will reach 56,571,428. Supposing that an acre will supply 100 ties, a liberal estimate, it will require 565,715 acres annually to furnish the ties required by the existing lines oi railways. For each line of railway there will be an annual demand for 377 ties, requiring the cutting off of 3.77 miles. It will require 30 years on an average for trees to grow large enough for making cross-ties. The acres that must be kept in timber and growing will be 16,971,420 for supplying ties to the railway lines now in existence.

The increase in railway mileage, estimated by two decades, is about 4,150 miles annually. To construct the railways that will probably be built in the next ten years, 109,560,000 ties will be demanded, the product of 1,095 600 acres of woodland. Allow 30 years as the period of growth for ties, this would add 3,286,801 acres to the timber reserve for railways alone, making a total of 18,995,579 acres as the needful reserve. Evidently this question is one demanding reach of statesmanship and a careful preservation of our present timber supply. The time is not far distant when one of the largest items in the construction of expenses will be the one for cross-ties.

It is reported that Canadians are again scouring the woods of northern Michigan for rock elm ship timber for export. They pay from $1.25 to $1.50 for each tree standing. The sticks are hewed in the woods. Last season, it is estimated, there was 5,000,000 feet of rock elm timber shipped out of Michigan.

The schooner Ottawa started from Chicago for Georgian Bay, loaded with outfit, 16 horses and 40 men, for the establishment of logging camp. Encountering the great gale of December 4th. and 5th, the vessel had to put into Grand Haven, where she lay up, and the expedition was abandoned.

HOW SAP MOVES.

All plants obtain their nourishment in a liquid or gaseous form by imbibition through the cells of the younger roots or fibrils. The fluids and gases thus absorbed, probably mingling with other previously assimilated matter, are carried upwards from cell to cell, through the alburnum or sap-wood until they reach the buds, leaves and smaller twigs, where they are exposed to the air and light and converted into organizable matter. In this condition a part goes to aid in the prologation of the branches, enlasgement of the leaves and the formation of buds, flowers and fruit, and other portions are gradually spread over the entire surface of the wood, extending downwards to the extremities of the roots. We often speak of the downward flow of sap and even of its circulation; but its movement in trees in no way corresponds with the circulation of blood in auimals, neither does it follow any well defined channels; for it will, when obstructed, move laterally as well as lengthwise, or with the grain of the wood. The old idea that the sap of wood descends into the roots in the fall, remaining there through the winter, is an error with no foundation whatever. As the wood and leaves ripen in the autumn, the roots almost cease to imbibe sap, and for a while the entire structure seems to part with moisture, and doubtless does so through the exhalation from the ripening leaves, buds and smaller twigs; but as warm weather again approaches, the temperature of the soil increases, the roots again commence to aborb crude sap and force it upward where it meets soluble, organized matter, changing color, taste and chemical properties. If this not the case, we could not account for the saccharine properties of the sap of the maple or for the presence of various mucilaginous or resinous constituents of the sap of trees in early spring, because we find no trace of such substance in the liquids or crude sap as absorbed by them from the soil. The life of the tree, Mr. Fuller teaches, is all in the bark and sapwood, the heart being dead and serving the tree only to strengthen it mechanically, as shown in the fact that it may be removed entirely by decay, and still the tree grows on vigorously for centuries.—*Fuller.*

EXCESSIVE STUMPAGE.

The following is a sample of a number of letters that have been appearing in the press of New Brunswick:—

HIGH STUMPAGE.

"*To the Editor of the Sun*:

"Sir, | I have noticed that there have been some discussion in the newspapers on the question of stumpage, and I don't think this question is brought up a day too soon.

"It is all very well for the Government to say that this tax is necessary for the purpose of revenue, but let them reduce expenses and do with less revenue. If they continue to insist on collecting this stumpage they will drive us, lumbermen, out of the country. The reason is because we cannot go into the woods and produce logs for sale to millmen without losing money.

"Every season some of us have to go greater distances, others have to incur additional expense in getting out their logs, and then, when we come to sell, we find that prices instead of being higher are lower, and we come out at the little end of the horn.

"I don't believe there is a practical lumberman in the country who does not agree with me.

"It is all very well for some of the papers to call attention to small purchases of licenses, but we know of hundred of miles of Crown lands that have been given up by the owners.

"I suppose it wont make much difference if I go elsewhere to earn my living, but if many others do the same thing people will begin to feel the effect on trade in the towns and the farmers in the settlements, for there is do doubt we support the various trades with our requirements for lumbering to a considerable extent.

"Yours,

"Lumbermen."

The steady advance in the rates of stumpage by the Provincial Government has led to much discontent among the lumbermen of New Brunswick. The log haulers are obliged to go far away from the streams for the timber; the damming of streams is a more expensive item than formerly; wages have increased considerably of late years; the camp supplies are of a higher class and more costly; and, everything considered, the cost of producing the logs and delivering them in the booms near the sawmills, has been so seriously increased that only the prices of an extra good market would remunerate the lumbermen. But while the market in England—to which they are principally shut up—has been growing worse and worse through the competition of Norway woods and the pine and spruce deals of other parts of Canada, with the New Brunswick spruce deals, the Government of New Brunswick has been steadily increasing the lumbermen's burthens by increasing the stumpage charged on logs cut on Government lands. These rates are excessive when compared with the value of the material,—in most cases equal to 25 per cent. of the value. It is not surprising, under the circumstances, that there was a large falling off in the cut last season, and consequently a serious reduction in provincial exports. Most lumber men have again reduced their operations for the current season, greatly to the loss of the farmers who depend largely upon the lumbering operations for a market for their surplus pro duce, and to the loss of the merchants whose transactions with the farming population are thus considerably curtailed. The towns are also sufferers, since there is less labor employed and less money disbursed in connection with sawing operations. It seems, too, that some lumbermen are leaving the province and looking elsewhere for a more congenial field, and we know of one large operator from that quarter who has recently made an extensive purchase of saw mills and timber limits on the Ottawa. If a reduction of the stumpage rates will prevent the ruin of lumbermen, and by reviving a prostrate industry tend to promote prosperity among the agriculturists and merchants, the Provincial Government should not hesitate as to the course it should pursue. It is manifestly its duty to relieve the industry of a least a portion of the special taxes imposed when the lumber business was in a prosperous condition. The charges were excessive even when spruce logs commanded their highest figures, and they should certainly be reduced now when they are out of all proportion to the logs' value. The lumbermen have a very strong case, and they will, no doubt, know how to press it vigorously.—*Montreal Herald.*

AN IMPORTANT MATTER.

On the question of lumber duties and the purchases of Canadian timber limits recently made by American lumbermen, the Montreal *Journal of Commerce* says:—

"The conservation of the timber supply of Canada is a matter of great moment to the future industries of the country. The part which wood of various kinds plays in these is so important that a diminution in its supply, or a large increase in its cost, would injure or destroy many branches of manufacture which now help to support a considerable proportion of the population.

"The lumber trade at present suffers somewhat from the duty exacted by the United States on the portion of the product exported there. We must always look to that quarter for a market for more or less of the cut, which, burdened with a duty of $2 per M feet, has to compete with the lumber manufactured in Michigan and Wisconsin. The effect of this has practically been that the Americans supply their wants from our forests at little more than the cost of manufacturing and delivery. The value of the standing pine in Michigan to-day ranges from $3 to $5, or more, per 1,000 feet; our timber brings no more than $1.50 to $2 per 1,000 feet for the standing tree. If the duty of $1 were removed by the United States it is not likely that the whole benefit would be reaped by manufacturers here. The object of the remission of the duty, and no doubt its effect to some extent, would be to reduce the price of lumber, and the benefit would probably be shared between the producer and the consumer. If such action increased the average price $1 per 1,000 it would be added almost entirely to the value of the standing timber, since the cost of manufacture would remain unchanged, and the increase would represent additional profit to be got out of the stumpage. An appreciation of 50 per cent or more in the value of our standing timber would be an enormus increase to the national wealth.

"Whatever may be said for or against a protective policy generally, it will be generally admitted that, as far as possible, the working up of the timber supply should be carried on at our own mills, and furnish employment for our own capital and labor. Heretofore this has been almost the invariable rule, as far as logs are concerned, the exports of this class of goods having been comparatively trifling in amount. But of late indications of a change have been apparent.

"The mill-owners on the eastern side of the state of Michigan have in part exhausted their own supplies of standing timber, and the balance has been rapidly accumulating in a few strong hands, where it is held for the future supply of the owner's mills, or for future sale at greatly enhanced prices. This has caused those in need to go further afield, and purchasers from Michigan have been exploring the Georgian Bay and Lake Superior country, and have been buying up any suitable limits which they could obtain. The timber for these could be rafted to the Saginaw river and other lumbering centres in Michigan, and all the benefit which this country will derive therefrom will be the export duty, at present $1 per 1,000 feet.

"Here is, we think, a case in which the intervention of the Government is called for. If the United States will not take our lumber without imposing a duty of $2 let us exact the same duty on the unsawn timber with which they would supply their mills. We should have free trade or fair trade in this article, if in any."

THE WEEPING BIRCH.

W have lately noticed, says a contemporary, how some trees have suffered in the very hot weather, especially in the London parks, and it is a pleasure to see the way in which the birch adds to its tiny shoots in the fiercest heat, and always looks as fresh as in May. The white (Betula alba) is, either in leaf or leafless, a handsome and graceful tree, and it is no less remarkable for its lightness and elegance than for its hardiness. It stands in no need of protection from other trees in no stage of its growth, and lives on the bleak mountain side and other exposed situations, which even the sturdy oak would shrink. It is a fast-growing, and rather short-lived tree, in favorable situations sometimes attaining a height of 80 feet, but generally not exceeding 30 feet or 40 feet.

Wrought Iron Shanty Cook Stoves

The Best Article Ever Offered to the Trade.

I have much pleasure in drawing attention to my **WROUGHT IRON COOKING STOVE, for Shanty, Hotel and Boarding House use.** These stoves are made of **Heavy Sheet Iron,** the top and lining of the fire-box being of **Heavy Cast Metal** and all the connecting parts of substantial **Wrought Iron Work.** The dimensions of these Stoves are as follows:

SINGLE OVEN STOVE

Top surface contains six 10-inch holes, with ample room between, and one oven 28 x 24 x 19. Fire box takes 28-inch wood.

DOUBLE OVEN STOVE

The Double Oven has a top surface containing twelve 10-inch pot holes, with two ovens, each 28 x 24 x 19. One fire-box of suitable size for area to be heated. Below will be found Testimonials from some of the leading Lumbermen, who have used my **Wrought Iron Cook Stoves** since I commenced manufacturing them. They are the names of gentlemen who are well known and reliable, and will carry more weight than any recommendation of my own could do.

The Best Stove I have ever Used.

Peterborough, May 31, 1880.

Adam Hall, Esq., Peterborough. Dear Sir,—I have used your Wrought Iron Cooking Stove in our lumbering operations since its introduction here, and have no hesitation in saying that I prefer it to any other. For durability, economy and efficiency, where a large number of men are employed, it is the best stove I have ever used. You can, with confidence, offer it to hotels, boarding houses and lumbermen.

Yours truly, THOS. GEO. HAZLITT.

The Stove for Lumbermen.

Peterborough, June 1st 1880.

Adam Hall, Esq., Peterborough. My Dear Sir,—We have used your Wrought Iron Cooking Stove and find it is very satisfactory for lumber operations, especially so on drives. We can recommend it highly.

Yours truly, J M. IRWIN

In addition to the above I can refer you to the following lumber firms who use my Wrought Iron Range exclusively in their camps:—

THE GEORGIAN BAY LUMBER CO.....Waubaushene
THE LONGFORD LUMBER CO.....Longford Mills
MESSRS. GILMOUR & CO.....Trenton and Ottawa
MESSRS. RATHBUN & CO.....Deseronto
THE MUSKOKA LUMBER CO.....Gravenhurst

EVERY STOVE GUARANTEED.

All the necessary TINWARE and CUTLERY for Shanties Supplied at the Lowest Prices.

ADAM HALL, Peterborough.

THE HENDERSON LUMBER CO. Limited.

David H. Henderson, *President;* Norman Henderson, *Vice-President;* Chas. H. Walters, *Sec-Treas.*

Dealers in, and manufacturers of, Dimension and Bridge Timber, Sawn Lumber, Clapboards, Shingles and Lath. Packing Cases and Boxes a Specialty.

OFFICE, MILLS AND YARDS: 342 to 396 William Street, MONTREAL, and at ROXTON FALLS, P. Q

It may not be out of place to mention a number of purposes to which the wood and bark of the tree are applied. Bread of birch bark from Lapland, made as long ago as 1867 shows one of the very many uses to which birch bark is or may be put. Shoes made of strips of bark, used by the peasants of Northern Sweden when at work in their distant meadow swamp; neat baskets in which they sell wild wild raspberries; and a specimen of the well known Alphorn from Switzerland, by no means exhaust the enumeration of articles illustrating birch bark at Kew. It is a valuable tanning agent, and an oil obtained from it is largely used in the preparation of Russian leather; indeed, it is to this oil that the peculiar fragrance of that article is due. Formerly the highlander used the outerlayers for lighting purposes, and, before the invention of paper, the inner ones for writing upon. The sap is convertible into wine, vinegar and spirit; when fresh it form an agreeable beverage, and an intoxicating liquor when fermented. The wood is esteemed for light turnery work, and is at the present time largely employed in the manufacture of spools or cotton-reels.—*Gardening Illustrated.*

WOOD-WORKING PATENTS.

The following list of patents relating to the wood-working interests, granted by the United States Patent Office, December 15th, 1885, is specially reported by Franklyn H. Hough, solicitor of American and Foreign patents, 925 F. Street, N. W., Washington, D. C.

332,241—Lumber drier—O. A. Duke, Clanton, Ala.

332,273—Saw guide—P. Miller, Norwich, Conn.

332,365—Saw mill, band—S. Stephens, Indianapolis, Ind.

332,691—Saw mill, circular—H. Wright, New Lisbon, Ohio.

332,611—Saw mill, portable—H. Wright, New Lisbon, Ohio.

332,611—Saw sharpening machine—D. W. Johns, New Albany, Ind.

332,291.—Sawing machine, scroll—A. D. Goodell, Millers Falls, Mass.

PATENTS ISSUED DEC. 22.

332,817—Lathe attachment—W. Middleditch, Detroit, Mich.

332,806—Lathe tool holder—C. H. Kelley, Somerville, Mass.

333,016—Lathe, turning—O. Kromer, Sandusky, Ohio.

332,991—Lumber drying Platen—N. S. Bouton, Hyde Park, Ill.

332,864—Measure, lumber—E. N. Barber, Kent, Ohio.

332,714—Saw mill, circular—R. B. Holt, Guthrie, Ky.

333,092.—Saws, device for filing and jointing circular—A. Winkler, Oneonta, N. Y.

Shafting.

A firm which makes a speciality of the erection of shafting, states that its experience teaches that the loss of power due to improper conditions in the line shafting amounts to 50 per cent of the engine power employed, and that the defects most commonly found are as follows:—Shafting too light for the duty, crooked shafting, hangers too far apart, hanger bearings too short, pulleys too heavy and not properly balanced, hangers which are not adjustable and not self-adjusting and sometimes filled with spurious Babbitt metal, and improper proportion between two pulleys connected by the same belt.

Southwestern Lumber Pool.

In April last the railroads centreing in Chicago formed a pool on lumber, the provisions of which shut out the Kansas City markets and left the Nebraska markets open for competition. The arrangement was not so satisfactory to the Chicago road as was expected, for the Northwestern dealers floated their logs down the Mississippi to various points, where they were cut into lumber, and from these places the Burlington and Rock Island carried the lumber to market. It is estimated that Chicago lost 20 per cent of its Missouri lumber business by this arrangement.—*Lumber Trade Journal.*

The Clyde Shipbuilding Trade.

During the past month 13,480 tons of new shipping was launched from the Clyde shipyards, compared with about the same quantity in November 1884, and 43,700 tons in the same month of 1883. The aggregate tonnage placed in the water in the course of the eleven months has been 171,084, being 91,838 tons below that of 1883, and no less than 198,600 tons short of the tonnage launched in the corresponding period of 1883. It is gratifying to notice that upwards of 30,000 tons of new contracts have been placed in the past month; but even with this very important addition to present orders, some of the yards remain practically empty, and a number of others are but scantily supplied with work. First-class steel screw steamers are constructed at £27 a ton; ditto, iron, £26 15s.; second-class screws, £22; cargo-carrying iron screws, £10 15s.; first-class iron sailing vessels, £11 7s. 6d.; second ditto, £11 2s. 6d.; third ditto, £9 15s.—*Ironmonger.*

Mrs. Barnhart, corner Pratt and Broadway has been a sufferer for twelve years through rheumatism, and has tried every remedy she could hear of, but received no benefit until she tried Dr. Thomas' Eclectric Oil; she says she cannot express the satisfaction she feels at having her pain entirely removed and her rheumatism cured. There are base imitations of this medicine for sale; see that you get Dr. Thomas' Eclectric Oil.

NORMAN'S
ELECTRIC BELT
INSTITUTION.

ESTABLISHED 1874.

These Electro-Curative Belts, Insoles and Trusses are

SUPERIOR TO ANY OTHER REMEDY.

And will Cure when all other remedies fail.

Circular and Consultation Free.

CONSTIPATION

Is entirely overcome by using NORMAN'S ELECTRIC BELTS. No injury can result, and they are pleasant to wear. Try one and be cured. Guaranteed genuine. Circular and consultation free. A. Norman, 4 Queen Street East, Toronto.

PETERBOROUGH, 29th September, 1884.

This is to certify that I have used one of Norman's Electric Shoulder Braces for my boy 7 years of age, for Spinal Curviture, with very beneficial results.

Health is Wealth

DR. E. C. WEST'S NERVE AND BRAIN TREATMENT, guaranteed specific for Hysteria, Dizziness, Convulsions, Fits, Nervous Neuralgia, Headache, Nervous Prostration caused by the use of alcohol or tobacco, Wakefulness, Mental Depression, Softening of the Brain resulting in Insanity and leading to misery-decay and death, Premature Old Age. One box will cure recent cases. Each box contains one month's treatment. One dollar a box, or six boxes for five dollars; sent by mail prepaid on receipt of price. We guarantee six boxes to cure any case. With each order received by us for six boxes, accompanied with five dollars, we will send the purchaser our written guarantee to refund the money if the treatment does not effect a cure. Guarantees issued only by J. D. TULLY Druggist, Sole Agent for Peterborough.

THE ADHESION OF A BELT.

Air and atmospheric pressure must have quite an influence on the driving capacity of a belt if a pulley must be turned perfectly true and left smooth for no other purpose than to allow the pressure of the atmosphere to hold the belt on the face of the wheel with all the crushing force of vacuum, but this idea doesn't seem to agree with the practice of cutting holes, or stripping up the belt to make air spacing to ventilate the belt and let out the cushion of air that is drawn under the belt while in motion. This cushion of air is observed when a surface plate is placed on another; the air between them holds them apart and they move on each other with ease. The cling of a belt is observed when a piece of leather is moistened and pressed on a flat sur face, and if a string is attached in the centre the pressure of the atmosphere is made appar. ent, but it is doubtful if any such manifestations of aerial lubrication, or vacuummental adherence are to be seen with a driving belt. The surface plates that have such a treacherous movement while there is a thin layer of air between them, assume a different attitude when one of the plates is slid on to the other while in contact. The air is driven off from each plate by the other. The belt when at work meets the pulley, not by coming in contact with the whole arc of the wheel at once, but by rolling over its surface from one end to the other, driving out the air before it. The disk of leather that will rise so many pounds with ease when attachment is made in its centre, is drawn off with the slightest force when the pull is taken from its edges. On these two principles a belt can be made to cling with all the weight of the atmosphere, or held apart with an air cushion that the greatest tension will not expel, but these two elements cannot work together. If an inclosure is about to explode there is not much danger of a collapse. The air that is drawn under a belt is no doubt seeking for a means of escape so long as the layer is compressed, but when extended the reverse takes place and the influence of the atmosphereic pressure becomes known. To follow these elements through one turn of the belt it will be easily seen that along the driving stretch both sides of the belt are affected alike by the air and meets with the same resistence from the atmosphere, but when it comes in contact with the driving wheel, tht layer of air on the nside of the belt, which is moving nearly as fast as the wheel, is no doubt making every attempt to pass between the belt and pulley, but has only its inertia and surface friction for assistance with the tension of the belt to work against. The belt in passing from the tight to the slack side is relieved of a portion of its tension and is not inclined to lie as closely to the face of the wheel as it did at the beginning of the arc of contact, which must now feel the effects of the atmosphere, as there is a tendency for the air to find its way beneath the belt to fill the space that had become partially rarefied. A smooth-faced wheel has all advantages of coming in contact with the belt without entrapping a layer of air in every imperfection on the surface, and if there are any benefits to be derived from the atmosphere by resting with its whole weight on the outer surface of the belt it has the liberty to do so, but from experiments with belting under pressure, and in a vacuum, it is evident that not the difference that is shown by the surface plates or seen with the disk of leather, is manifested in the adhension of a belt.—*Boston Journal of Commerce.*

THE MANUFACTURING SITUATION

The general manufacturing situation is what might naturally be expected toward the close of the year, although in many respects it is an improvement on the condition of things a year ago. Most manufacturers, in view of the fact that prices of their goods were close down to the cost of production, have pursued a very cautious and conservative policy during the last twelve months, not only in studying the economies of their business, but also in avoiding any large and unwieldy accumulations. Hence their stocks are now in better shape than for many years past, and they are not under the necessity of forcing immediate sales, or of resorting to the loan market, in order to bridge over to the new year. Of course there is a little tendency to an accumulation in some lines of fabrics, as is always the case at this season; but it is so slight, and the demand from the trade for the spring business is so near at hand that it has no weakening effect upon the views of holders.

Many millowners are taking advantage of this dull, between-seasons period, in the way of putting in new machinery and making needed repairs, so as to be fully prepared for the next season's work. Not a few of them are introducing long-delayed improvements which were sadly needed in their business, and the effect of which must be to cheapen and facilitate processes as well as to widen their margin of profit. They have strong confidence in the future of values, from the fact that supply and demand have at length been brought to an equilibrium and that consumers are generally in better condition than for many years past. The large cotton, corn and hog crops give them assurance that our agricultural population will be able to take and pay for more than an average supply of manufactured goods.

They are also encouraged by the fact that but few goods will be carried over be the distributors, and that buyers will be early in the market to supply their immediate wants. Moreover, they see signs of returning confidence and increased business activity in the steady improvement of the stock market and the increased earnings of our railroad corporations, which are usually regarded as unfailing indications of a corresponding improvement in all branches of trade and industry.

Hence manufacturers are naturally looking for a good spring trade, as well as a gradual advance in prices of their products to a fairly remunerative point. Yet they do not propose to abandon their cautious policy, or to pile up goods in anticipation of the demand for them. Just now they are in the attitude of watching and waiting, watching the signs of the times as a basis for future business calculations, and waiting for orders for goods from early buyers, some of whom, from remote points of distribution, have already made their appearance, and bring favorable reports of the trade prospects in their respective localities. On the whole the business outlook for our skilled industries, if not entirely satisfactory, points in the right direction, and shows that matters on the mending hand.—*Manufacturers' Gazette.*

THICK AND THIN SAWS—SOLID v. INSERTED TEETH.

"F.McG" contributes the following remarks to an American contemporary:—

I have had experience with saws for the past ten years, saws thick and thin, with both solid and inserted teeth, and have learned that the first and most important point to attend to is to have the saw adapted to the mill. In fact the mill has as much to do with making the saw work successfully as the saw has with making the mill a good one.

With a large, solid mill, with ample and steady power, a thin saw can be run with excellent results. The teeth should be regulated by the amount of feed to be used to the revolution, with more teeth than would be necessary for a thicker one; but for a light mill, in which the power is apt to be unsteady, with slow feed, the saw should be thicker, with less teeth and hammered stiffer, and in every case the maker should know just what kind of a mill he is making the saw for, whether heavy or light power is required, and what the speed of mandrel and the feed is to be. Then if the mill is in proper shape, and the maker understande his business, the saw will give satisfaction

The mill is often to blame. A poor mill will spoil a good saw very quickly, and then the blame is too frequently laid to the saw.

My experience is that each tooth should cut away one-sixteenth of an inch of timber to work easily. I believe that a tooth will cut one-sixteenth just as easily as, if not easier than, it would cut half of it.

With regard to solid and inserted tooth saws, the latter surely have the advantage. Still I am a friend to a solid tooth when it is in good order, bnt it is hard to keep the teeth regular and in proper shape and, as it is worn away, the strain of the saw is being changed, which makes it necessary to have it hammered quite often. If an accident happens to a saw, if it has solid teeth, the operator has to go to work and modify the whole saw as well as the teeth that have been damaged, but if it has inserted teeth he probably puts in new teeth, increasing the size of his saw rather than making it less.

I have had experience in sawing iron. I ran a lumberman's clipper into a road spike full speed with 3 in. feed. It took every tooth out or off and the plate came in contact next; it bent nearly all the shoulders behind the teeth, and I don't know what would have happened if I had not reversed the carriage. I thought my saw was ruined, but I hammered it up as well as I knew how and on starting it it worked as well as, if not better, than ever. I have got in several other scrapes almost as bad with the same saw, and yet it is just as good and big now as ever. If it had bean a solid-toothed saw it would have been worn and torn all to pieces. The inserted tooth, without doubt, runs easiest, as the tooth can be made sharper or more pointed, so as to cut into the wood like a chisel instead of scraping or scratching their way.

ROTATION SPEED OF MACHINERY.

The method of arranging this so that it will not produce vibrations has been explained to some extent in an article recently published in an American paper. As a vibration has a tendency to communicate itself to the objects to which the machines are attached or to the buildings in which they are placed, the importance of understanding this subject will be apparent. Whenever such vibrations are communicated there is a loss of power, and the quality of the work done is liable to be reduced. A few common cases of the methods of preventing injury from vibration to other structures besides the mill in which the machines are placed will make this the better understood. Railway trains are required to stop before going under the bridges built across large streams. By this means the vibrating motion that is often apparent in a train moving at full speed, is allowed to cease, otherwise it would be communicated to the bridge, and, increasing as the train proceeds onward, commence a process that must eventually terminate in its destruction.

It is for the same purpose that teams are not allowed to travel faster than a walk, and that soldiers maching in a body must break their ranks when crossing long bridges. Whenever two or more steam-engines, or any number of machines that have their power applied, in part at least, by means of a reciprocating motion, are located in the same building, their tendency to communicate vibrating motions to it may be counteracted by giving them rotation speeds that vary so that they cannot keep step. The principle by which this could be accomplished was fairly presented in the article referred to, but the mechanical calculation or the purpose of applying it practically in arranging their speed under different conditions was hardly made plain. Take, for illustration, the first example: "Thus 96 and 100 would not do, for each is equally divisible 4, and two would come together on a stroke every 96x100 divided by 4 =2,400 turns." This is one of the processes for obtaining the least common multiple of the two numbers that represent their rotation speeds. But one travels faster than the other, and it cannot give the correct answer. Where two or more engines or machines are in use, and running at different speeds, the number of turns each will make from the time they start together on a stroke till they come together again may be ascertained by dividing the rotation speed of each by their greatest common divisor. In this way the 96 divided by 4 and the 100 by 4 gives 24 and 25 turns respectively. Where the engines or machines have rotation speeds which are "prime" to each other, that is neither of which are evenly divisible by any part of the other, they will when started on a stroke come together as often as each completes the number of strokes that represents its rotation speed, or with that at 99 and 100 they will come together when each has completed 99 and 100 turns respectively.

In arranging for the number of cogs in the cast gearing so commonly used for transmitting power, a factor should be taken into the account that bears some relation to the principle of running machines at different rotation speeds for the purpose of preventing the vibration that might result from allowing them to keep step.

That is the desirability of making their numbers "prime" to each other, whenever that is practicable, for the purpose of securing greater uniformity in the wearing away of the faces of the cogs, and of transmitting a steadier motion to the machinery driven. The relative speeds of wheels geared together are in proportion to the diameters to their pitch circles, and the calculations in regard to them are made from the number of their cogs. The common multiple of these, or the least common multiple, if they are not "prime," gives the number in each that will pass a given point between the time that two certain cogs starting together will come together again, and not the number of turns. That is ascertained for each wheel by dividing this result by the number of cogs. In the case given where one wheel has 288 and the other 256 cogs; the 288x256 divided by 32= 2,304, the least common multiple. Dividing this by the number of cogs in each gives eight and nine turns respectively. Where these numbers are used, each cog in the large wheel engages with eight in the small one, and each in the small one with nine in the large wheel, and these eight and nine cogs come together in some way at every turn, and never engage with any of the other cogs in either wheel. Where their numbers are "prime," like 99 and 100, 38 and 75, or 287 and 288, each cog in one wheel will engage with every cog in the other before it will come around to the one from which it started, and the number of turns made by each wheel in doing it will be equal to the number of cogs in the other. By applying the same principle the number of turns each of three wheels geared together will make from the time they start together till they come together again may be ascertained. Take, for example, three wheels having 99, 100 and 101 cogs. Multiplying these numbets together, and dividing their product by the number in each wheel, gives 10,100, 9.999, and 9,900 for the number of turns each will make.

Unless we can make our technical education capable of practical application, we might as as well continue to do our work by the old rule of "thumb."—*Timber Trades Journal.*

Lloyd's.

Application is intended to be made by the corporation of Lloyd's in the ensuing session of Parliament for an Act to extend and enlarge their powers as regards the "collection, publication, and diffusion of intelligence," and to provide that the publication and diffusion of any such intelligence shall be deemed to be a privileged communication from them. By other clauses power will be sought for to authorize them to establish signal stations and to erect signal houses, with all requiste telegraph and telephone wires, appurtenances, &c., "at such places on the coast of Great Britain and Ireland and the islands appertaining or belonging thereto as they shall think fit, and to maintain and work the same," such powers, however, together with the taking of lands or houses for the purpose, to exercised only with the approval of the Board of Trade.

How to Test Leather Belting.

We believe a considerable quantity of so-called "cheap" German belting is sent into this country and sold under various names. As regards testing leather belting the best test, of course, is that of wear, but to find out if it has been properly tanned the following method is recommended by M. Eitner:—Cut a small piece of leather out of the belt and put it in vinegar. If the leather has been perfectly tanned, and is therefore of good quality, it will remain immersed in the vinegar, even for several months, without any other change than becoming of a little darker colour. If, on the contrary, it is not well impregnated with tannin, the fibres will promptly swell, and after a short time become converted into a gelatinous mass.—*Timber Trades Journal.*

REVIEW OF THE LUMBER TRADE DURING THE PAST SEASON.

The Quebec *Chronicle* says :—Another shipping season is over and another winter has closed in upon us, and we may now offer a few supplementary remarks as we have gleaned them from manufacturers of square timber, merchants, mill-owners and others. To but few of these, as far as we can gather, has the season been a satisfactory one. Trade in England of every description has been very much depressed, and sales of timber during the past year have been very difficult to make and the prices obtained very meagre. Morever, timber manufacturers on this side held their rafts for full prices, so that sales of square and waney white pine were not frequent, and only for immediate wants. Square pine—with the exception of a few early rafts of new timber, which brought good prices, selling at much the same figure as last year, and large first-class waney a little higher. Most of the stock of pine is still in first hands. Hardwoods have been very dull of sale. In oak there has been but very few sales, and at lower prices than last season; the shipments of oak plank from United States ports on terms with which Quebec cannot compete has greatly damaged the prospects of this wood n our market. The production of square timber last winter was very much larger than anticipated at this time last year and was quite unwarranted by the reports from the various markets. Deals have been in good demand in Great Britain, and most of the mill-owners on this side managed to dispose of their produce at full prices to the shipping merchants. A larger quantity than usual came from Michigan and were shipped at this port and in Montreal. A very large quantity of deals are now shipped from Montreal, most of which should be shipped from this port, and we learn that even some birch timber and walnut were this year sent to Montreal by barge to be there loaded in a steamer, instead of being placed on board here as she passed outwards, owing to the fact that the Ship Laborers will not allow the steamers to use their steam winches to take such timber over the side. It is to be hoped that the outcome of the recent conference at the Board of Trade rooms will be the doing away of some of there regulations which tend towards the avoidance of this port and the aggrandizement of others at our expense. On the whole the season has been a very dull and unsatisfactory one, and we learn that since the close of navigation the accounts from Great Britain have been worse than before and a very dull time is looked for in the trade. This should have due weight with manufacturers both of timber and deals and prevent the blocking of the markets by over-production, which can only result in anxiety and loss to themselves.

FREIGHTS.

As compared with last year there has been a slight increase of tonnage at this port.

SAILING VESSELS.

1884.....499 vessels		380,147 tons
1885.....502 "		382,826 "
More this year.... 3		2,679 "

OCEAN STEAMERS.

1884.....238 steamers		427,834 tons
1885.....242 "		446,522 "
More this year.... 4		17,688 "

Rates of freight have been about on a par with last year, ruling rather lower towards the latter part of the season, and have been anything but satisfactory to ship-owners, and even at these rates masters had some difficulty to find cargoes when they came out seeking. A large quantity of deals were shipped in Montreal not only by the regular liners but by outside steamers which the scarcity of produce at that port forced into the deal-carrying trade.

The following is a statement of prices current during the season :—

A NASAL INJECTOR free with each bottle of Shiloh's Catarrh Remedy. Price 50 cents For sale by Ormond & Walsh druggists Peterborough

WEST'S WORLD'S WONDER or family liniment has proved to be one of the greatest blessings of the age. It is a never failing remedy for rheumatism, cuts, sprains and bruises. Call on J D. Tully f or a trial bott e and you will use no other

Advice to Mothers.

Are you disturbed at night and broken of your rest by a sick child suffering and crying with pain and cutting teeth? If so, send at once and get a bottle of Mrs. Winslow's Soothing Syrup for children teething. Its value is incalculable It will relieve the poor little sufferer immediately. Depend upon it, mothers, there is no mistake about it. It cures dysentery and diarrhoea, regulates the stomach and bowels, cures wind, colic, softens the gums, reduces inflammation and gives tone and energy to the whole system Mrs. Winslow s Soothing Syrup for children teething is pleasant to the taste, and is the perscription of one of the oldest and best female nurses and physicians in the United States, and is for sale by all druggists throughout the world Price 25 cents a bottle.

MIRIMACHI SHIPMENTS.

Mirimachi shipments of lumber abroad for the year ended 4ft December, 1885, verify the predictions of last year in showing a decided falling off. The shipments for the five years before averaged 131,4fi0,000 s. f. per year. They were as follows :—1880, 155,000,000 super. feet; 1581, 128,000,000 ditto and for the three following years 117, 149, 108 million respectively, while there were this year only 87 million feet. The timber shipments of this season have been rather larger than those of last year, the totals being, 1884, 3 974 tons, and in 1885, 4,944 tons. Palings to the number of 3,207,444; 71,900 broom handles, 720 shovel shafts and 12 bundles of shingles were shipped. According to the *Advance*, the deals ends, scantling and boards went to the following countries :—

	Sup. Feet.
Great Britain	47,239,692
Ireland	24,984,538
France.....	10 223,213
Australia.....	1,534 672
Africa.....	2,262,198
Italy.....	1,005,715
Total.....	87,250,028

Geo. McLeod and J. B. Snowball are the largest shippers this year, Stewart & Ritchie's firms coming next.—*Monetary Times.*

THE estimated cut for the year of the Eau Claire, Wis., mills is 228,550,000 feet of lumber and about 130,000,000 shingles, the smallest utput since 1881.

FOR SALE,
TIMBER LIMITS & SAW MILL

THE MASKINONGE LUMBER COMPANY offer for sale their property consisting of Saw Mill at Maskinonge Bridge, P. Q., within quarter mile of N. S. Ry. Station, also good facilities for shipping by water. Capacity of Mill 50,000 feet per day, water and steam power; saws and belting all complete. Two hundred and forty square miles of limits situated about thirty miles from Mill, which are interseeted by a number of good driving streams, and are rich in Pine, Spruce, Cedar, etc. Satisfactory reasons for selling out.
For further particulars appiy to

Notice to Contractors.

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for Public Buildings at Peterborough, Ont," will be received until TUESDAY, the 20th day of January next, inclusive for the erection of Public Buildings, for

THE POST OFFICE,
AND
THE CUSTOMS & INLAND REVENUE OFFICES
AT PETERBOROUGH, ONT.

Plans and specifications can be seen at the Department of Public Works, Ottawa, and at the office of J. E. Belcher, Architect, Peterborough, on and after FRIDAY, the 18th day of December next.
Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied and signed with their actual signatures. Tender for each building to be separate, and forms will be supplied for each.
Each tender must be accompanied by *accepted* bank cheque, made payable to the order of the Honourable the Minister of Public Works, *equal to five per cent* of the amount of the tender, which will be forfeited if the party decline to enter in a contract when called upon to do so, or if he fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.
The Department does not bind itself to accept the lowest or any tender.

By order,
A. GOBIEL,
Secretary.
Department of Public Works, Ottawa, 7th December, 1885.

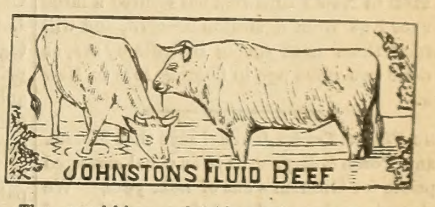
Office, Wellington Street, OTTAWA. 1LW

Valuable Timber Limits
AND
SAW MILL PROPERTY.

THE SUBSCRIBER WILL SELL HIS TIMBER LIMITS and Saw Mill property, at Cowichan, British Columbia, and if purchased by a Company, will invest a large amount of price in shares.
The Limits are supposed to contain about two hundred millions superficial feet. (An estimate is now being made.)
The Timber is mostly Oregon Pine of an excellent quality. The average haul, only about half a mile to floatable water. The run thence to mill, 30 miles.
Full particulars furnished on application.

W. SUTTON
L20 Walkerton, Ont.

Johnston's Fluid Beef



The nourishing, palatable and warmth giving qualities of Johnston's Fluid Beef has caused this invaluable preparation to before a favorite and fashionable beverage for the winter season. It is now obtainable on draught at the leading hotels and restaurants throughout the Dominion 1w7

All communications, orders and remittances shoulp be addressed and made payable to THE PETERBOROUGH REVIEW PRINTING AND PUBLISHING COMPANY (LIMITED), Peterborough, Ont.

Communications intended for insertion in the CANADA LUMBERMAN, must be accompanied by the name of the writer, not necessarily for publication, but as a guarantee of good faith. Communications to insure insertion (if accepted) in the following number, should be in the hands of the publishers a week before the date of the next issue.

The CANADA LUMBERMAN is filed at the Offices of MESSRS SAMUEL DEACON & Co., 154 Leadenhall Street, London, England, who also receive advertisements and subscriptions for this paper.

PETERBOROUGH, Ont., JAN. 1, 1886.

THE Rainy Lake Lumber Company, of Rat Portage, Ont., and Winnipeg, Man., have made an assignment.

THE schooner A. J. Ryan, laden with lumber from Toronto to Brockville, went ashore at Oak Point, during the snow storm recently. The lumber was shipped by the Rathbun Company.

A FIRM in New Brunswick has secured a large order for logs from a Boston concern, and will transport them next spring in rafts by sea, as was done two years ago in floating logs to New York.

THE *Timber Trades Journal* says that Messrs. Bryant, Powis & Bryant have as usual arranged the prices for Gilmour's cut of next year. We are given to understand that the quantities and specification of this celebrated pine stock will be about the same as last year.

AS a sample of the method of making money that has attended some of the pine lands traffic in Wisconsin and Michigan, a sale at Eau Claire is given. Thomas Carmichael paid $8,000 for a tract of 880 acres, four years ago, and has just sold it for $40,000.

YOUNG Canadians complain that this season, says the *Northwestern Lumberman*, they came over the line to work in the logging camps, expecting to get from $26 to $30 a month, as formerly, and are surprised to have but $16 to $20 offered, and must show a certificate of vaccination to boot.

BURNHAM & STILL'S mill, East Saginaw, Mich., together with 200,000 feet of lumber, was burned December 10th. The origin of the fire was supposed to be incendiary. The mill was valued at $22,000. The lumber was owned by different parties, and valued at $3,500. The mill was insured for $15,000.

MR. ANDREW ALLEN has been elected president of the Montreal Lumber Co., the annual meeting of which was held recently. Directors chosen for the ensuing year are:—Messrs. Andrew Allan, Hugh A. Allan, Andrew A. Allan, C. D. Brydges, Jackson Rae, John Molson and Mr. Morris.

A CLOSE estimate of the lumber on the docks about Muskegon Lake places the total amount on the docks at from 92,000,000 to 100,000,000 feet. This estimate is from reliable sources and can be relied upon, as the situation on December 1st, 1885.

THE schooner Joseph Souther, at New York from Satilla, reports that on December 6th she passed a wreck with two topmasts out of water, heels up, and hanging by rigging. Soon after they passed considerable wreckage, deals, planks, etce., which leads to the belief that a lumber-laden vessel has been totally wrecked.

THE output of the Chaudiere mills, near Ottawa, Ont., this season, was 227,000,000 feet. Good lumber has sold well, but coarse has been slow to move. The season's trade has, on the whole, been considered good. Small and coarse logs, once left in the woods, to feed forest fires, are now taking to the mills for sawing.

THE newspapers of Winnipeg and the districts to the westward frequently mention what they term the building boom that is prevailing in numerous towns. The wheat crop of the Canadian Northwest begins to tell on the improvement of the country. It is likely that next spring it will be found that a large amount of lumber will be wanted along the Canadian Pacific and its branches.

HERE is something of interest to parties who are operating, or propose to operate, in the Spanish River district of Ontario. The Sable & Spanish Boom & Slide Company has applied to parliament for an act to confer on the company named the right to attach booms to the shores at the mouth of Spanish River, at points south and east of Rock Island, and to construct and maintain piers from a point or points on the north shore of the river, to the island, and from the island south and east to the main shore, and to use booms in connection therewith. Of course the company asks the right to collect tolls on logs and timber run through the works.—*Northwestern Lumberman.*

CONCERNING the failure of the Rainy Lake Lumber Company, of Rat Portage, Ont., a Canadian financial journal says:—"The Rainy Lake Lumber Company, limited, of Rat Portage and Winnipeg, is one of the many enterprises of great promise which began with the golden area of the Northwest, and drooped with the waning fortunes of the boom. The capital was $350,000, in 3,500 shares of 100 each, of which $312,000 was understood to have been paid up. Among the chief promoters were Messrs. J. Ross, C. P. R., contractor; L. J. Dawson, M. P.; W. J. Alloway, and Hugh Sutherland. During the boom the assets of the company were estimated rounnly at $1,000,000, and the local bank that knew them felt proud that they could boast of such a customer. Mr. Sutherland, who was the president, retired some time ago. The company had been endeavoring for some time past to issue bonds, but without much success, so that the recent assignment took no one by surprise. To add to their troubles their hands struck last June, as their wages were somewhat in arrear. The liabilities are in the vicinity of $200,000."

OUR TIMBER RESOURCES.

DISCUSSING the proposal to increase the duty on logs exported from Canada, the *Lumberman's Gazette* says:—

"There would not be much gained by the adoption of such a prohibitory tax, except that the timber resources of the Dominion would be preserved. If there is any danger of such a tax being imposed Michigan men will cease purchasing Canadian timber limits and they will remain on the hands of the Government totally unproductive. The limits which Michigan men are purchasing are in a portion of the Dominion which will not very soon be brought under settlement unless the lumbermen prepare the way, which they will not soon do if the matter be left to the development of the Canadian lumbermen."

The *Gazette* has not an adequate conception of the energy of the men engaged in the lumber business in Canada, or of the capital invested, or capable of being employed in that trade. If it were a fact that the timber limits purchased by the Americans would remain unproductive if not sold to them, it would still be worth considering whether it would not be better to allow them to remain unproductive, or unremunerative, far the present, than to allow American lumbermen to drain our resources, to the disadvantage of our own manufacturers, while the timber resources of their own country were preserved and held until their value would be enhanced by the stripping of our limits.

But the position of the custom rates present the question in another light. The Canadian export duty on logs is half of the American import duty on lumber, which gives the American manufacturer who purchases Canadian limits and conveys the logs across the lines to be manufactured an advantage over the manufacturer who turns the logs into lumber in Canada and exports the manufactured article. The question is not, therefore, whether the limits are to remain unremunerative for a time, and increase in value, or be sold to Americans, but whether the Canadian authorities will so arrange the export duty on logs as to place the home manufacturers in as good a position as the Americans so that in the competition for business they will not, by custom duties, be placed at a disadvantage. The opinion that the timber limits will not be utilized at all, unless by Americans, is absurd in the face of the amount of capital employed in the lumber business in Canada, but even if the limits would not be stripped as quickly if left to Canadians alone the country would receive additional immediate benefit by having the lumber manufactured here and the prospective advantage of the increased value of the standing timber.

The *Northwestern Lumberman* states that the stumpage is higher in Michigan than in Canada. This, if correct, would appear to neutralize the disadvantage of paying duty on lumber were the Michigan lumbermen to manufacture only the timber in their own state, but when they cut timber in Canada the stumpage is the same and when they carry the logs to Michigan and cut them there the duty is less.

This a question which should receive ample consideration and immediate attention, as it is not only the lumbermen themselves that are interested, but the whole country. As the lumbermen are primarily interested, however, they should take the initiative in endeavoring to have the disadvantage under which they are placed at present removed, either by increase of the export duty on logs or by some other means.

In this connection the result of the negotiations for reciprocity will be awaited with interest.

LUMBER AND TIMBER.

The outlook for sawn lumber is by no means unpromising. American advices show some good features. Building has been very active in American cities. Brooklyn, for example, has built 3,665 houses in eleven months of the present year against 3,050 in twelve months of last year. The tone of the Chicago market is firm and inquiry still frequent; but the abrupt closing of the season of navigation makes it nearly certain that the year's receipts will fall below those of last year. The *Northwestern Lumberman* predicts that values will remain steady till the February trade begins. Respecting the Saginaw Valley the same authority says: "This fall find the logs in the Au Sable which will be hung up in 'pickets' and 'jams' less than 15,000,000 feet. Last year there was hung up, when the season ended, over 80,000,000 feet. This, of course calls for a large cut of logs the coming winter. Besides a small amount of logs to commence on next season, the docks contain not over 45,000,000 or 50,000,000 feet of lumber, being over 20,000,000 less than last year."

Demand for white pine in New York continues good, both for local use and export. House-builders and furnishers there are very busy, and buy in large quantities. Prices for yellow pine are very low and the trade being done in that article is small compared to the total capacity of the market. Lumber stocks in Albany are fairly assorted, but are estimated at a fourth below that of last year. A prominent dealer of that city places the November distribution from that city at 20 per cent. over the same month of 1884. Dealers are feeling confident, prices are not only sustained but advancing. In Boston, too, according to advices second week of the present month, the increase in price is felt more perceptibly every day.

We hear from Ottawa that Gilmour & Co. have made definite arrangements for the disposal of the coming season's cut of their deals at satisfactory prices and we are told of one or two other mills which have arranged a basis with buyers for their whole "mill run." A topic of current conversation in lumber circles at the capital is the sale, now said to be about consummated, of the Levi Young estate to G. A. Grier, of Montreal, and R. A. & J. Stewart, of Newry, Ireland, and St. John and Miramichi, New Brunswick. The price mentioned is $600,000. Application for incorporation as a joint stock concern has been made in the proper quarter by Messrs. Bronson & Weston, well-known Ottawa mill men. It is stated, besides, that another long-established concern in the manufacture of wood goods will follow suit before long.

The timber market is at present comparatively stagnant; the season having closed, but little indication is given of present activity or enhanced prices. There is, however, in the minds of well-informed persons, a feeling that the spring will witness an improvement, This view is strengthened by the recent advance in the value of iron. The supply at Quebec is, besides, said to be distinctly less than in former seasons. Hardwood timber and lumber remain unchanged in price. The feeling is upward in maple, basswood and black ash, which are used for furniture making, but no change in price will be made till after the first of January proximo.—*Monetary Times.*

CUTTING PRICES.

Cutting of prices is a suicidal policy for all concerned; it never does any one any good, not even the purchaser, for he more than loses in the quality of the goods the small amount of cash that he is supposed to make on the purchase. Generally, however, the laborer that produces the goods is the first one to lose in this process. The manufacturer feels that he is obliged to lower his prices in order to compete with his rivals, and, as the cost of the goods is already as low as it possibly can be to allow any degree of profit, he find that the easiet way to come out whole is to reduce the wages of his workmen, and this is the process usually employed. The only safe plan is for our manufacturers to combine and arrange a basis of rates for goods, according to the cost of production, allowing a reasonable profit, and then to stick to it. This is the safe plan, but we are afraid it will be a long time before they can be made to realize the destructiveness of the present plan to all concerned sufficiently to abolish it.—*The Furniture Worker.*

Improved Machinery.

Never before were the wood workers and lumber manufacturers of New England more anxious to secure the latest improvements in wood-working machinery. Future profit in the manufacture of lumber must consist in the most intelligent working up of the odds and ends, in reducing the bulk of the sawdust heap and the slab pile, and in the employment of such machinery as shall show the minimum labor bill and the maximum quality manufactured. The saw mills of the East are far behind those of the West in economical appointments and in actual capacity for business. The successful woodworker of the future must keep abreast of the practical improvements of the day.

It is Simply Marvelous

Mrs. Theron Burr, of Adrian, Michigan, writes that West's World's Wonder or Family Liniment cured her daughter of Rheumatism which she had been afflicted with from childhood. It is infallible. Price 25 and 50 cents per bottle. And sold by J. D. Tully.

HARRIS, HEENAN & Co.

124 AND 126 QUEEN STREET, - - MONTREAL.

Patent Stitched–Steam Power Pressure Stretched–Oak Tanned

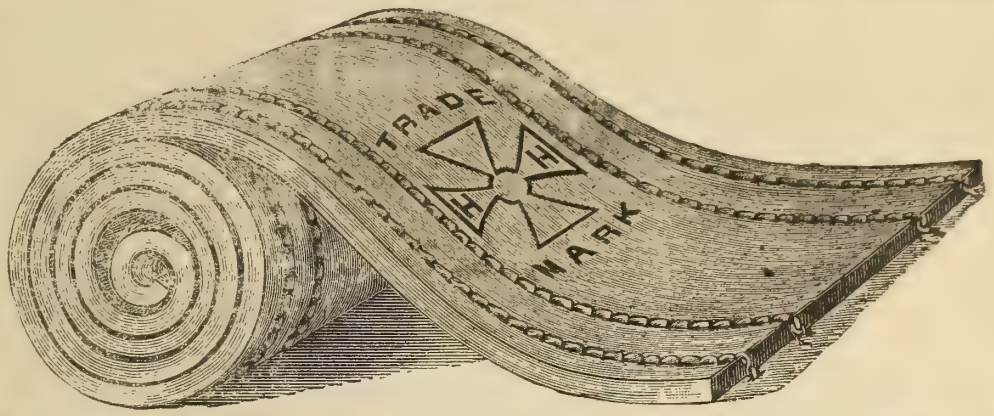
TESTIMONIAL

IRA GOULD & SONS, CITY MILLS, Nov. 13th, 1884.

Harris, Heenan & Co.

DEAR SIRS.—Your Patent Sewed Belt has been in use in our "City Mills" for some time. We are thoroughly convinced of its superiority over any belt, American or Canadian, we have used in an experience of over 35 years. It stretches so little, and gives so little trouble, that compared with riveted belting, the sewed belt saves double its price in time and laces saved. We heartily recommend it to manufacturers as the cheapest and most satisfactory belt in the market.

Yours respectfully,
W. C. MARSHALL,
Mills.



TESTIMONIAL.

PECK, BENNY & CO., CANAL HORSE SHOE AND NAIL WORKS, MONTREAL, 15th Nov. 1884.

Messrs. Harris, Heenan & Co., Montreal.

I have pleasure in recommending the belting manufactured by Messrs. Harris, Heenan & Co., of this city. After thoroughly testing it, I find it greatly superior to any belting that has come under my notice and fully equal to all they claim for it, and certainly without an equal for cross or double belting.

CHAS. R. ELLACOTT.
Supt. H. S. & H. N. Dept

LEATHER BELTING!

The Best, therefore the Cheapest, Belt in the market.
Replaces, when used, all others.
More Pliable and Durable, especially at the splices.
Stretches but little, always retains it original wid h.
Superior for Cross or Double Belts.
Runs sraight and true, does not start at the laps.
Single equals medium double.

25 per cent Stronger, 33$_1$ More Lasting, and 12$\frac{1}{3}$ Heavier, than any other Leather Belt.

TIMBER RESOURCES OF BRITISH COLUMBIA.

The extension of railways into wild and remote regions is the most practical way to develop their resources, whatever they may be. One country has a surplus of what another often very much requires, and the easy and rapid transit by railway enables commercial men and capitalists to visit places where the material they require, or the markets in which to sell, may be abundant. Lines of railways crossing over plains and mountains frequently save to the traveller thousands of miles, and reduce to the consumer the prices of commodities, that under other conditions would be very dear. In this moralizing the writer has before his mind the three or four great lines crossing the continent of America, the largest and most direct of them being the Canadian Pacific Railway, which traverses entirely British territory, and extends from the Atlantic to the Pacific ocean, a distance of 3,500 miles. In its course this great road cuts through many mighty forests, especially in the comparatively unknown timber country northwest of the noble Ottawa, and along the banks of the picturesque Rainy river, where our "only General" made his first reputation. The lumbering resources of this vast area are very great, and to some extent will doubtless before long be utilized; but compared with those further on in British Columbia they are almost insignificant. Unfortunately where there is an abundance of anything there is also a tendency to waste, and certainly that is the case with timber in all parts of Canada, more of it being burned and otherwise destroyed than reaches the market. England receives yearly from Germany, Sweden, Norway, and other European countries, large quantities of manufactured timber goods, which, with the cheap and easy transit there is now to the Atlantic coast, and then by rapid steamers to different points in the United Kingdom, might be readily supplied from the so-called waste of Canadian forests.

We are next summer to have in London a great Intercolonial Exhibition, and doubtless any idea calculated to increase the volume of trade between England and her dependencies will at this great gathering, from all who are interested, receive due consideration. Canada is keenly alive to every thought and circumstance likely to be to her interest, and this question of manufacturing the goods rather than sending the raw material, is one to which she will probably give some attention. It is, however, with the almost limitless forests of British Columbia and their giant timber, that in this article we chiefly intend to deal. The entire length of that salubrious, but comparatively unknown Province, is now traversed by the Canadian Pacific railway, which, from the fertile prairies of Manitoba and the Northwest, crosses the Rocky Mountains, and enters British Columbia on its eastern border, descending the western slope to Port Hardy, on the Pacific Ocean. The iron horse now screeches through British Columbia forests, the timber of which is the largest on the surface of the globe, logs frequently squaring 40 inches at the Port Moody Mills. The following extract is from a popular workon this lumber:—"It is a tough, strong wood, well adapted for heavy beams, but it is also good for planks and deals. It makes excellent masts and yards, and is used for shipbuilding and housebuilding. It grows to the height of from 150 to 250 feet, and attains to a thickness of six to nine feet, and carries its size well up. Dressed masts of from 36 to 45 inches in diameter, at one third from butt, and with proportions for the required length, have been supplied from the Douglas fir forests of British Columbia. In Australia, New Zealand and Great Britain, this timber is known as Oregon pine, though Oregon does not export it to those markets. At present the chief seat of its export is British Columbia and Puget Sound, on the opposite shore of the Gulf of Georgia and on the bays and indentation along the Straits of San Juan, which a few years ago were in dispute between England and the United States, but on the award of the present Emporer of Germany, then King oi Prussia, was given to the latter country. This magnificent timber is chiefly found on the outside or Pacific coast front of the western range of the Cascade Mountains, as it would seem to require for its growth the warm, moist and salubrious climate peculiar to the sea line of those mighty hills. The Douglas pine forests are now difficult to explore, but being tapped by the railway, together with the general advance of progress, will doubtless soon overcome that difficulty. The railway will carry the manufactured lumber to the east of the Rockies, where it is very much wanted by settlers, who are now rapidly filling up Manitoba and the vast plains of the Northwest. Hitherto the product of British Columbia could only be brought to the eastern markets of America or to Europe by ship, coming around Cape Horn, or through the straits in the extreme south of Magelan, but now the Canadian Pacific railway is a direct communication between the forests of the Pacific coast province and the Atlantic ports, as well as to all the markets of Canada and of the United States east of the Rocky Mountains. In the valley of the Fraser, the largest river in British Columbia, there are many kinds of timber, but up to the present, commercially, they were of little value, simply because there was no outlet except by ships to countries on the other side of the Pacific ocean or to Europe. Now, however, a deal of this timber, which consists of oak, ash, spruce, cedar and fir, will be taken by the railway to the Manitoba plains, where it is much wanted, and some of it may even reach Quebec for shipment to England. To anyone anxious to preserve the world's timber supply, how sad to see its rapid destruction, often wantonly, by squatters and others in those countries where it is now so abundant. The great thing is to clear the soil, and a settler who may take up land on which there may be heavy timber, will often get rid of it the following cruel but somewhat ingenious fashion: He will take a large auger, and bore two holes into the heart of the giant tree, one hole slanting up, the other down, and meeting inside in the great trunk. Then he will fill into the upper one small pieces of an inflammable substance and set fire to them. The tree will soon catch, and the lower auger hole, acting as a blast pipe, will cause the fire to hiss and roar in the body of the doomed tree until it is destroyed. Let us, however, hope that the rapid settlement of population on the fertile prairies of Manitoba and the Northwest, and the growing requirements of civilization, will find other uses for this article so necessary for homes and comfort rather than in such a merciless way reduce it to ashes. With the depression existing in almost every branch of English trade, many a young fellow with a little capital, and a knowledge of the timber business, would do a worse than take a trip to British Columbia to see if its mighty forests do not offer a field for profitable investment in the near future.—*Timber.*

QUEBEC CULLERS' OFFICE.

The following is a comparative statement of Timber, Masts, Bowsprits, Spars, Staves, &c measured and culled to date:—

Quebec, Nov. 20.

Advice to Mothers.

Are you disturbed at night and broken of your rest by a sick child suffering and crying with pain and cutting teeth? If so, send at once and get a bottle of Mrs. Winslow's Soothing Syrup for children teething. Its value is incalculable It will relieve the poor little sufferer immediately. Depend upon it, mothers, there is no mistake about it. It cures dysentery and diarrhœa, regulates the stomach and bowels, cures wind, colic, softens the gums, reduces inflammation, and gives tone and energy to the whole system Mrs. Winslow s Soothing Syrup for children teething is pleasant to the taste, and is the perscription of one of the oldest and best female nurses and physicians in the United States, and is for sale by all druggists throughout the world Price 25 cents a bottle.

LIVERPOOL STOCKS.

We take from the *Timber Trades Journal* the following Comparative Table showing Stock of Timber and Deals in Liverpool on Dec. 1st 1884 and 1885, and also the Consumption fo the month of Nov. 1884 and 1885 :—

	Stock, Dec. 1st. 1884.	*Stock, Dec. 1st. 1885.*	*Consumption for the month of Nov. 1884.*	*Consumption for the month of Nov. 1885.*

TIMBER FOR SINGLETREES.

The *Wheelwright* says:—It is exceedingly important that buggy singletrees should be sawed properly, especially if they have been turned green. If the sawing is not done preperly the ends will be all kinds of sizes and shapes. In fact not the ends only but the whole singletree will shrink in sersoning so as to make a variety of shapes and sizes. Many of them will be ill-shaped, scarcely resembling the original design. The grain should be uniform, that is, it should cross each singletree the same way. If this point is not attended to the shrinkage tending so much more to decrease the circle of the grain than to contract the grain will have results known to the trade. It is better to have the grain cross each singletree in the same direction even if they are to be seasoned before turning. We do not attempt to say they will be stronger through the arrangement referred to, but it will certainly prevent much warping and twisting if the grain is either square across, what is better known as bastard, or if the grain crosses the singletree thin way up and down.

Singletrees for buggies and carriages, especially second-growth timber, should not be kiln-dried to season it. Yet it is necessary to use a kiln for a day or two unless these pieces can be loosely cross-piled in the open air protected from the sun and rain. If the temperature is not summer heat, or the timber has been cut some little time, it will stain, giving the all-white wood a reddish cast so strongly resembling the red or heart wood as to be so classified by the inexperienced. One or two days heat will not injure the fibre, but to thoroughly season the singletree in a kiln, with dry heat, will surely deteriorate the strength. The older and brasher the fibre the greater the injury, especially if overheated a little. The injury is sustained even if from a young and thrifty second-growth tree, but possessing superior vitality, it is less noticeable. In the rapid processes for seasoning lumber, steam or other means of artificial dampening is always adapted. This is practically impossible with a class of goods where the moisture would stain and injure the wood. Kiln drying will not injure the fibre if the heat is kept at a mild summer heat, but with this temperature it would require several weeks, whereas the modern way seems to be to take the timber from the log and ship it out bone dry in one weed's time. This quick seasoning simply means to crust over the outside and bake the exterior until its life is seriously injured, often almost totally destroyed.

Singletrees are graded into three qualities—second growth, mixed second growth,, and forest. The mixed secondgrowth is a half-red and white or all red, but second growth many of them more serviceable than the all white. The forest is a common grade of timber not thrifty enough to be classified with the two better grades. Some manufacturers grade their singletrees second-growth, select forest, and forest; the second growth grade will take the half-red and white and the choicest of all-red that are strictly second growth. The selec forest differs from the mixed second growth only in taking in what the name implies, a "select forest," but not second growth. In classifying as second growth, select forest and forest, the distinction is not made as clearly and justly as in substituting mixed second growth for the select forest. Selecting the best of the forest can but weaken the forest grade. The mixed second growth are sold at a price dividing the difference between the second growth and forest. When turned from green timber the warpidg, twisting and springing form no small per cent. of the whole. The percentage is greater with small, young, tough, thrifty growth than with the larger trees and an ordinary growth. This percentage is farther increased by careless sawing. The grain crossing the singletree diagonally makes a very undesirable singletree, especially if turned green. These singletrees that have sprung out of shape in seasoning need not be thrown away, but can be straightened by using the singletree as a lever with the fulcrum at the centre of the point needed to be straightened. With a quick pressure exert sufficient strength to force the singletree to or a little beyond a straight line, and the wood will retain this shape. If badly sprung and a very tough fibre it will be necessary to first steam the singletrees. This discolours the wood somewhat and takes the additional time. Singletrees and spokes that are practically dry will spring to some extent if stored or exposed to an unnatural or excessive heat.

Waggon-makers or repairers can save their stock from worms by oiling with linseed oil. Singletrees, doubletrees, neck-yokes, spokes and cross-bars that are of white hickory and are kept in stock for a year or more will be eaten by worms or kept in a dark place or protected as above. Coal and kerosene oil are good also, and the expense of applying is but little. Linseed oil is preferable, as it acts to some extent as a wood filler, filling the pores, thus aiding the painting which follows in its proper place. A boy can take a rag dipped in the oil and go over a large number of pieces in a day's time or a vat can be used long enough to admit of several dozen at a time being put in and picked out one at a time, and put where they can drip for one or two minutes. The expense of this is much less than those who have not had the experience might imagine, and far less than the loss of stock by worms. Some manufacturers oil all their white hickory stock before shipping, it being applied with a belt similar to other belting processes. The flat part of the buggy singletree is left unbelted by some factories to give the carriage-maker more timber to work on. This is a good plan aside from the unfinished look of the goods. But it will never do to ignore look even if they do cost something.

JONATHAN BOICE, of Grand Rapids, Mich., lately purchased of O. P. Pillsbury & Co., a tract of pine in Roscommon county, same state, estimated to cut 50,000,000 feet, at $210,000. The logs will go into Muskegon river, and be floated to Muskegon for manufacture.

MAINE TIMBER.

Lumbering operations have been prosecuted vigorously for years in Maine and the impression is quite general that the forests of the state are quite denuded of merchantable timber. But year after year large amounts of logs are run down the stream, and we believe the Penobscot has contributed about 300,000,000 feet to the general stock this year. The hardy lumbermen of that state are again in the woods lifting up their axes against the trees, and a paragraph in the Bangor *Commerciat* states that "there will be more lumber cut on the south branch of the Dead river the coming winter than ever before in one winter." The names of a number of lumbermen and the amounts they will cut are given, and the *Commercial* adds:—"One can judge of the density of our Maine forests, by considering that this whole amount of lumber, viz.: From 15,000,000 to 19,000,000 feet, will be cut from a strip about 12 miles long and seven miles wide." Michigan contains forests which are capable of turning out a good deal more lumber from an equal extent of territory, but it cannot be denied that the Dead river country is a pretty good lumbering district, considering that Maine has been extensively lumbered for 50 or 60 years. If Michigan shall be capable of doing as well after she has been undergoing the process so long, it will be very fortunate for those who inhabit the state a quarter of century hence. It will be able to do so if care is taken not to destroy the young pines, and the advance of agriculture does not result in bringing under cultivation too great an extent of forest land. Maine has been favored by having a large amount of forest land that could not be profitably cultivated and the forests, left to nature, have been rehabilitated. Michigan has some, but not so great an extent of such land; it might be fortunate if she had more.—*Lumberman's Gazette.*

QUEBEC SHIPPING INTERESTS.

A comparative statement of the number and tonnage of sailing vessels and steamers which entered at Quebec, inwards and outwards for the years ending December 31st, 1884 and 1885, which was prepared by Mr. L. G. Belleau, is published by the *Chronicle*. The exhibit for 1885 shows a slight increase in the volume of business done when compared with the figures of the previous year. In 1885, sixteen more vessels visited Quebec than in the preceding shipping season. The total amount of tonnage in 1884, was 646,365 against 667,112 in 1885, making a difference in the way of increase of 747 tons. In 1834, on the contrary, the decrease over the returns of 1882 was 139,407.

In British ships arriving in Quebec, we may note a total of 306 in the year lately closed, as against 317 in the year 1884,—a loss of 11 ships From the United States, Italy, Belgium and Austria we had no ships last year, but there were sent us one from France, 28 from the German Empire, 239 from Norway and Sweden, one from Denmark, three from Russia, one from Holland, and one from the Argentine Republic. The increase in the number of Norwegian and Swedish ships arriving here in 1885, as compared with the number returned in 1884, was 35; there is also an increase in the tonnage from the German Empire, of one vessel over that of the previous year. Russia, which sent us four ships in 1884, sent us only three in the season just closed. A decrease may also be mentioned in the tonnage from France, which sent three vessels last year, and only one this year,—and Denmark which sent us three in 1884 and but one in 1885. The number of men employed in 1884 was 17,080, as against 15,990 in 1885,—a decrease of 1,090 men.

Mr. Belleau's statistics also show the date of the opening of navigation at the port of Quebec in each year since 1830 to the present time, as well as the date when navigation closed. In 1885, the first Montreal steamer of the season arrived here on the 7th of May, while vessels from sea reached this port on the 5th May. The last ships sailed for sea on the 21st of November. The return shewing the number of vessels entered inwards and outwards at this port from 1849 to 1885, inclusive, is instructive and worthy of attention. In 1885, inwards 580; outwards, 479.

WHEN TO BLOW OUT.

Our Rothsay correspondent propounds this question: "Is it adviseable to blow out a boiler under 35 or 40 pounds pressure?" and doubtless engineers throughout the State will give sufficient answers. It is to be remembered first of all that the steam boiler is subject to expansion and contraction, and under an established and known margin of safety both these operations, incidental to the working of a boiler, will regulate themselves without giving anxiety to those in charge. Every engineer should have definite information regarding, not only the average capabilities in ordinary service of the appliances he uses, but also of whatever extra strain they will bear or energy they may be required to exert, under unusual circumstances. Thus it may be frequently found necessary to blow out mud from the drum of a boiler, and this must sometimes be done without reference to steam pressure. It is done with from 30 to 45 pounds pressure. An accumulation of mud in the drums is to be avoided; unless removed it will dry up and form a crust or cake which will prove injurious. Experienced engineers advise blowing out under these circumstances. On the other hand, when it is intended to shut down for the purpose of cleaning out the boiler, the practice of blowing out under such pressure should be avoided. It should never be forgotten that a steam-boiler requires careful handling, and a careful engineer would not blow out under excessive pressure, because he ought to know that when a boiler is subjected to sudden contraction it will be injured to a more or less extent. No absolute rule can be made; the thing to do is to know all that can be known and follow one's best judgment.—*Wood and Iron.*

A TIMBER LADEN SHIP ON FIRE

QUEBEC, Dec. 11.—Captain Simpson, of the ship Coringa, from London, at New York, reports on November 17th at noon in lat. 43.57, long. 33 20, sighted a bark in the northward, showing signals of distress; lay to until he ran down to us, proving to be the bark Nora Hansen, from Quebec for London with deals, 28 days out. She was dismasted, had seven feet of water in the hold; the pumps were broken, and the captain wished to be taken off as the ship was becoming water-logged. The crew, consisting of 18 men all told, came off in their own boats. I sent men back in the boat and boarded the bark to get all the provisions we could from her, and then as night was coming on and the wind and sea increasing, set fire to the wreck and proceeded on our course. The bark Nora, Capt. Hansen, cleared at the Quebec Custom House on the 19th October for London with the following cargo by Messrs. Bryant, Powis & Bryant: 7,206 bright pine deals, 1,320 spruce deal ends, 22,023 spruce deals. The Nora was 958 tons burden, built in 1857 at Alton, Germany, and hailed from Drammen, Norway, where she was owned by G. Samuelson and others, and partly insured.

The Greatest Inventor.

In reply to "A Pupil," we should certainly say by far the most prolific inventor in connection with wood-working machinery was the late Sir S. Bentham, whose patent specifications of 1791 and 1793 are marvels of their kind, and either describe or foreshadow nearly all the wood-working operations in vogue at the present day; in fact several of his inventions have been patented again during the last twenty years. In point of fact there is little doubt that Sir Samuel Bentham was a most remarkable man, although he does not by any means occupy that "niche in the temple of fame" to which his inventive genius undoubtedly entitled him.—*Timber Trades Journal.*

LATE figures in the Toronto *Globe* make it appear that receipts of lumber at that point this year had been 11,000,000 feet less than in 1884. A correspondent to the same paper explains the apparent deficiency by the fact that receipts this year for local consumption, not being reported with receipts for shipment, have been sufficient to raise the total to about that of last pear.

Chips.

IT is reported in Eau Claire that H. C. Putnam has sold 880 acres of pine land on the Red Cedar, to Thos. Carmichael, for $40,000.

LUMBER to the amount of 15,000,000 feet has been shipped from Duluth this season that passed out of Lake Superior by way of the Sault Ste. Marie canal.

IN some of the camps in Michigan vaccination is being required. In Thompson Smith's Sons' camps, Cheboygan county, a physician went the rounds and treated all the arms that had never before been sore.

THE receipts of Lumber at Oswego, N. Y., in November amounted to 18,500,000 feet, an increase of 6,000.000 feet over the same month last year, and 170,000,000 feet have been received since the opening of navigation, being 20,000,000 feet less than during the same period last year.

GEN. SMITH, of the Barnhart Lumber Company, at Duluth, has been instrumental in the breaking up and arrest of a gang of thieves, who stole lumber from the companies piles, ran it off in small boats, and sold it, and committed other depredation of a larcenous character.

A SPECIAL timber agent has been investigating the Northern Pacific and the Manitoba Improvement Company timber trespass cases He reports to Commissioner Sparks that these corporations have caused to be cut from the public domain 45,100,000 feet of lumber and bridge timber, 84,744 railway ties, 15,400,000 shingles, 32,035 cords of wood, and 20,000 cedar posts, valued in all at $613,400.—*Winnipeg Commercial.*

A FOSSIL oak has been discovered in the bed of the Rhone—dark as ebony, hard as iron; supposed to have been 3,000 years in the bed of the river. This tree is 150 feet high, 58 feet cube, and considerably over 120,000 pounds in weight. This reminds one of other phenomenal tree. As, for example, the oak of Allouville, bearing a chapel in its branches; the chestnut of Ætna, covering 30 horsemen; the tree of Augustus, in the hollow of which Caligula gave a dinner to 40 guests; the plantain of Xerxes, which sheltered himself and 100 guardsmen; the plantain of Cos, whose trunk measures 30 feet in circumference, and whose branches are propped up by marble columns. In the churchyard of La Haye de Routot, in Normandy, there is an immense yew that once covered the whole cemetery. It is 1,80 years old and grows every day.—*Laclede, in Montreal Gazette.*

As the schooner Mercury, lumber laden, was making the passage from Ludington to Chicago, during the great snow storm and gale of last week, the deck load was washed overboard, but the vessel was kept on her course, and stood up well. About midnight, John Anderson, one of the crew, was swept overboard by a huge wave. It was impossible to round to and pick the man up, and the schooner was kept on her way, though the cries for help of the unfortunate sailor could be heard above the howling of the sea. The captain was at the helm, and after a few minutes had elapsed he was astonished to see Anderson hanging on to a fender and trying to climb on board. He was quickly rescued from his perilous position. He had at first been swept some distance from the schooner, but little ahead, and managed to swim until he could get hold of the fender. His escape in such a sea seems like a miracle. The Mercury arrived at this port after a perilous passage.—*—Northwestern Lumberman.*

SHINGLES AS SUBSTITUTES FOR SIDING.

"Why are the walls of all these old houses in Nantucket and, for that matter all along the coast, covered with shingles instead of clapboards?"

"Probably because they have such high winds here and the shingles are warmer; I suppose most likely they are cheaper, too."

"At any rate they are perfectly lovely to look at, so delightfully quaint and old-fashioned."

"I think they are just horrid. They make all the houses look like poverty stricken pigpens."

We do not see fit to set the speakers right either in the interests of building or of esthetics. As a matter of fact the reason given for the use of the ancient shingles instead of the modern "siding" or clapboards, were almost the only ones that could have been hit upon that were not correct. In itself a covering of shingles is not as warm or impervious to the stormy winds that rage along the New England coast as a layer of clapboards properly put on and well painted. The reasons for the change in this particular item in building are not of much practical consequence now but the change itself is interesting as an instance of the natural evolution that obtains in building as in everything else.

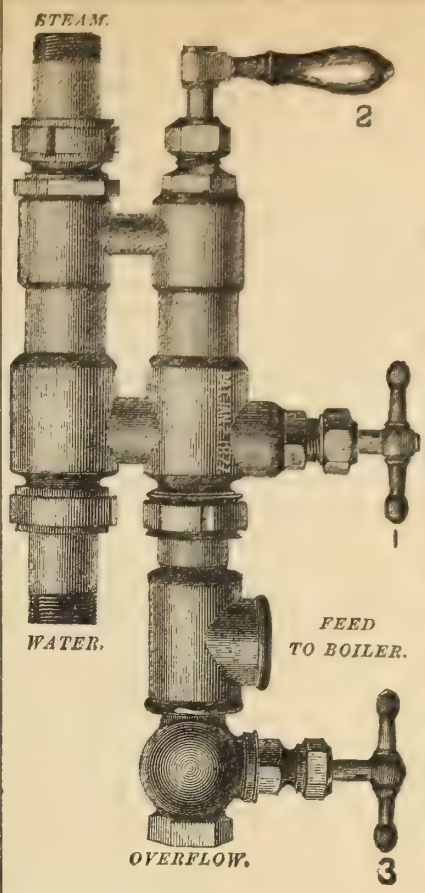
Hands were made before forks or saw mills, and shingles were doubtless used in former times because they could be made "by hand." The cross-cut saw with a man at each end was the first and for a long time the only saw mill extant. It was much easier to cut logs across the grain into short blocks, split the blocks into thin pieces, and with a "draw shave" on a rude horse reduce them to the tapering shape required, than to saw the logs into long thin boards one man above the log and the other in the saw pit beneath. Moreover after the boards were sawed, unless they were well seasoned and painted, they would split and check when exposed to the weather. There was no time to wait for lumber to season and paint was among the luxuries. In the case of the shingles, too, it was of less importance what kind of wood was used, anything that would split true and freely and shave easily would answer, although the latter quality was of less consequence, for muscle was cheap in the old times. Only a few years ago in hill towns of New England, chestnut shingles were made—they may be still for all we know—and served an excellent purpose, barring their propensity to stain the work below them and to kick up at the corners, the latter habit imparting a roughness to their appearance that might now-a-days be reckoned a merit rather than a defect.

These old shingled walls are far more common along the seaboard than inland for which there is doubtless a natural reason. Among the hills in the fresh water regions, there is hardly a mountain brook large enough for a three years old trout to turn around in that will not be found at some part of its course bestridden by the ruined skeleton of a primitive saw mill, in which the "up and down" saw in its unwieldy frame impelled by an "overshot" or some other kind of shot-wheel, made frantic plunges through the rough log at the rate of one stroke every second, more or less, according to the size of the log through which the jagged teeth were knawing their way and the flow of water. Along the coast and especially on the islands this local motive power was lacking and transportation from the interior was by no means as easy as in the present year of grace.

Doubtless shingles will last longer than clapboards, especially if both are unpainted, but it is not to be assumed that our venerated ancestors took this durability into account. These same ancestors of ours had so many shining virtues that it is not necessary or fair to ascribe to them more than their due. It was stern necessity, not pure wisdom that prompted them to use shingles. In applying clapboards the nail heads are left exposed while the overlapping courses of the shingles cover them; perhaps this exposure of the iron to the salt atmosphere has been one reason why the old fashioned outer garment has been maintained along the coast, but this is more probably the result of the imitation and conservatism that make certain styles of architecture and modes of buildings seem to be indigenous in certain localities.

Finally and in conclusion, sawed shingles—sawed by machines each one of which does the work of 100 men—cost somewhat more than the usual cost of horizontal siding; other things being equal they will last longer, if they are well lined with building paper.

As for the respective merits of the two materials in point of looks, that question is respectfully referred to the speakers who began this discussion, and to others whose opinions are equally well-founded.—*The Builder.*



The Hancock Inspirator

Best Feeder known for Stationary, Marine or Locomotive Boilers.

The Injector Perfected!

All sizes lift water 25 feet.
No adjustment required for varying Steam Pressures.

Over 70,000 Now in Use.

CEDAR.

It occurs to us that if red cedar was properly introduced in this market, and its merits once thoroughly known to the consumer, it would become a very important factor in the lumber interests of the city. It is a matter worthy of comment that red cedar fence posts and red cedar dimension is in less demand in this market than in any other of the country; and this, too, in the very face of the fact that, of all timber that grows, there is none possessing such lasting, such imperishable properties, if you please, as red cedar for fence posts. We recognize the fact that it cannot be secured in this market, so as to be sold to the consumer at anything like the prices for which white cedar is offered, but we see no economy in paying 15 cents for a white cedar post that will last but five years when for 30 cents a red cedar one can be had that will last a generation of years.

We were not a little surprised to know that some time since a couple of Tennessee gentlemen shipped a car load of red cedar posts to this city, and came in person to dispose of them and, if possible, lay a foundation for future trade, but their experiment resulted in a deplorable failure, not only to receive a consideration for them that justified them in bringing them to this market, but in making any arrangement for future trade.

We cannot understand why it is that a wood possessing such valuable merits, not only for posts, but for the building of clothes-closets in dwellings, is so little in demand. Where cedar is used in interior work vermin and moth will be unknown, and it is susceptible of beautiful finish that adds to its value as a wood for house-building purposes.—*Lumber Trade Journal.*

Market Reports.

TORONTO.

From Our Own Correspondent.

DEC. 24.—The lumber trade during the last two weeks has been nearly as brisk as during the summer months. Owing to the fine open weather building both in brick and wood have gone on with but little diminution, but during the holidays we do not look for much trade. The amount of lumber piled off at the railway yards has not varied much for the last month past, except in some particular lines. Good cull boards are tending upwards in price. The quantity here now is much smaller than when I wrote you last, and no large stock remaining at any of the mills north of this place. The demand for this grade of lumber is good, owing to the number of speculative buildings in course of erection. The most difficult class of lumber to make sale of at present, on this market, is the coarser grades of shipping cull boards. The cause for this is obvious, builders can use a good grade of mill culls to as good advantage, and save from two to three dollars per M by so doing. I feel convinced, however, that on the opening of the spring of 1886, it will be found that we have no overstock of any kind of lumber, above the legitimate requirements of the trade on our own local markets, of course it will be understood I refer to that already cut and in stock. It would be premature at the present time to speculate as to the probable cut of logs during the present winter; this much, however, is certain, that owing to the lack of sufficient frost to harden the swamps, thus far hauling has been slow and unsatisfactory, and but small progress has been made up to the present time, so that the crop of logs for next season's cut may not prove as large as anticipated.

Efforts will be made by the lumbermen here to get the shunting of cars made free during the next season to all sidings westward of the points of arrival. This concession should certainly be granted, as it is manifestly unfair on the part of the railroad companies to perform the same service eastward free, and charge from $1 to $2.50 for a similar service westwards. In fact I have never heard any defence made by the railway companies in regard to such charges, and most certainly no reason that will bear discussion can be made, and in the interests of dealers and consumers alike it is to be hoped that this concession will be granted.

OTTAWA.

The *Canadian Journal of Commerce* says:—Now that the sawing season may be said to be practically over, it is possible to estimate correctly the amount of business done this season by the Chaudiere mill proprietors. Most of these mills have been working for seven months, one having started as early as the 28th of April; and, though the count in the various offices is not quite complete, it is gleaned that the total cut will foot up about 277,000,000 feet. Thus it is somewhat less than last year, but it is stated notwithstanding, that sales have been fairly good.

Lumbermen on the Chaudiere say that, in this season's sales, quality has largely regulated the market; first-class stuff going off steadily at good figures, while poorer qualities were slow, and only saleable at figures much lower in proportion. Knotty and rough lumber has not been in such demand as last year, and consequently the net cash returns have not been so great; but good first-class lumber has been readily disposed of at satisfactory figures. An examination of the percentage of good and rough lumber shows that, on an average of all the season's cut, not more, and perhaps not so much, as 30 per cent. can be classed as first-class, while the remainder is divided into lower grades. The season's trade has been on the whole good, and dealers claim that the outlook for a good season next year is promising, unless some unforseen event should mar the prospect.

CHICAGO.

AT THE YARDS.

The *Northwestern Lumberman* of Dec. 26th says;—It would be unreasonable to look for numerous orders and heavy shipments this month, and especially in the heel of it, when the members of the trade are divided in their minds and their time between closing up the year's business and the holiday festivities. Yet there are dealers who are inclined to complain because there is not a lively demand and heavy shipments. It is safe to say that there was never a time in the history of the Chicago trade—not even in the booming year 1882—when shipments to the country were not comparatively meagre in the last half of December. The current month is no exception to the general rule. And yet there is a considerable movement of lumber. The local requirement is being to a great degree maintained by the late moderate weather.

But the city and suburban demand is not taking all the lumber that is now being sold. There are good trains pulled out of the district every day, loaded with lumber bound for all points of the compass. Though rates to eastern points are high, they do not operate as a complete bar to eastward movement.

It can, however, be intimated this season that it is quite possible that trade will take an earlier start than has been usual in former years. Conditions are a little peculiar. Last year the yards in the southwest were loaded up on a 5-cent rate Kansas city and common points The result was that the spring trade in that direction was to a large extent anticipated, for the retail yards in Kansas and Western Missouri were filled up with stock that was carried over the winter. This year there has been no loading up in the southwest or anywhere else. It is thus likely that the spring trade will start earlier than common; a condition that will be emphasized if the winter should continue so open as to permit of outdoor consumption of lumber. Dealers can keep their weather eye on this view of the situation, so as to be ready to jump into the breach when it is open; but they should not jump too soon.

It is also possible that the retail dealers of the interior may send in their orders for the spring trade unusually early, for fear that there may be a rise of prices later on. This will depend on several things that may appear after January 1st. If it shall then be seen that the aggregate of stocks is larger than was anticipated, that the logging season promises a full crop, and that the general outlook is not favorable, there will be a continuance of the hesitating, hand-to-mouth manner of buying. But, on the contrary, if the open winter should promise a limited log crop, the lumber in sight should be less than was anticipated, and railroad building loom larger for the year to come, everybody holding lumber would tighten his grip on prices, and buying of stock for the spring trade would evince an anxiety to put in supplies before a possible advance in values.

It is claimed by some of the wholesale dealers that the expectation of break in freight rates throughout the fall prevented many heavy retail yards from stocking up in November. The break did not come, and there was no extraordinary movement of lumber. If this outcome is to be regretted, because there is more stock remaining in the yards here than there otherwise would have been, some consolation can be extracted from the fact that what lumber was not moved in November will have to go forward after January 1st.

During the week two strikes of Chicago, Burlington & Quincy employes have slightly interrupted the handling of cars in the Twenty-second street district. There was a little strike of the engineers, and another of the switchmen. Both faired off quickly, and the pulling and the switching was resumed after a brief stoppage.

LIVERPOOL

The *Timber Trades Journal* of Dec. 12th says:—Although the recent excitement consequent upon the elections is rapidly waning, if indeed it be not practically dead, there has been, so far, no evidence of any desire to return to business on the part of buyers, whose unwillingness to give out any orders of importance is as strongly marked this year as it has recently been. Niether do the merchants on the spot here, if we may judge from the auction sale held on Wednesday appear inclined to speculate in any extensive buying at present.

Fortunately the arrivals of timber and deals continue light, and with only a small quantity on the quays there is no necessity for putting on undue pressure to effect sales.

Should the early part of the new year bring with it that resumption of good trade which all have so long hoped was near at hand, but which has been so disappointingly deferred, we ought to see some advance in prices, especially in spruce deals and other leading articles of the trade, as the stocks, though sufficient for the demands likely to be made upon them at the present rate of consumption, are not above an average.

The only public sale held since my last communication was that of Wednesday, the 9th inst., above referred to, when Messrs. Farnworth & Jardine offered the cargo of spruce and pine deals now landing ex Annabella, from Dalhousie. The company present was limited in number, few buyers from the country being present. The proceedings were very slow, and though the auctioneer went through the catalogue twice, his patience was not rewarded as it ought to have been, and about one-half the spruce deals were withdrawn, as were also the 3rd quality pine deals, the pine scantling and pine deal ends.

The parcel of birch timber withdrawn at the last sale from the cargo per Henriette, from Cape Breton, consisting of 873 logs, was again brought forward, but no acceptable bid was made for it; but we believe a line of it was subsequently sold on private terms.

LONDON.

The *Timber Trades Journal* of Dec. 12th says:—There was really nothing fresh to report in Wednesday's sale. The bulk of the goods were offered under reserve, of which, as far as we could make out, only a couple of lots were sold.

Of the unreserved parcels there was nothing particular to attract attention. The pine boards, ex York City, in small lines, excited some competition, but, we consider, without much advantage to the price, each bidder drawing the line at previous values for similar goods. The goods ex Queen of the North also hung at prices which similar realized a short time back; in fact, the cautious way that goods are now bought at public sales is strongly indicative of an overdone market.

Though Canadian wood is not heavy in the market, pine, in batton and board sizes, comes in contact with North of Europe wood in the better qualities, and these selling for almost nominal values has an unfavorable influence on Quebec stuff.

With the feeble prices Archangel sold at last week, £14 15s. for 1½x7 Quebec 1st pine is by no means a bad price. The various little odd lots sold low, and 4th Gefle 1x7 yellow at £5 5s. is about 20s. under cost. Some Wyborg submitted, 1st quality, 2x8, at £0 15s., seemed about level with prices of a month ago. In one of the Noxember sales 2x7 fetched £6, so that the present would rather incline toward an improvement. These small parcels are, however, very unsafe guides to market changes; but 3x11 Wyborg at £7 10s. is not so bad.

Of the St. John's yellow pine sold at Messrs. Churchill & Sim's sale on Thursday we need hardly make any comment, the low prices realized speak for themselves, and 3x11 to 15 in., in lengths from 10 to 22 feet at £6 10s. is significant of the low estimation the wood was held in.

BRISTOL.

The *Timber Trades Journal* of Dec. 12th says:—Quebec sawn longitudinals are mostly imported this year, instead of railway timber. This is an advantage to the merchants, as the slab trade was very injurious generally. Stocks all around are moderate, there not being apparently a great excess of any class of goods. A cargo of Stettin oak (mostly butts) has arrived, and met with a very fair sale.

TYNE.

The *Timber Trades Journal* of Dec. 12th says:—The past seven days show a very short list of arrivals, and none of them call for any special comment. The weather has been extremely stormy, a very severe frost having come on, followed now by a snow storm of some severity, the two combined being amply sufficient to stop all outdoor employments, and in consequence thereof business has been practically suspended. Most of the saw mills are only partially employed, many of them working three-quarter time only. With the advent of winter in its severest form, a great number of men are out of employment, and the distress reported is very great. If not so great as last year, it is certainly sufficient to excite the sympathy of the more fortunate, and already in the city and neighborhood relief committees are being formed to cope with it if possible.

No ships of much importance are reported as being due, and in all probability we shall not have many more during the present season.

LEITH.

The *Timber Trades Journal* of Dec. 12th says:—The arrivals of wood cargoes during the week have not been numerous, but they include a cargo yellow pine timber, deals, etc., per Almedia, from Quebec, for Messrs. James Duncan & Co., and a large cargo pitch pine timber per Lanarkshire, from Pascagoula, for Messrs. Ferguson, Davidson & Co. The Almedia is the last cargo expected at this port from Quebec this season.

Business continues very quiet, and the trade from the yards is very restricted, the keen frost which has prevailed for the last few days being rather against orders being received from the builders.

Messrs. Wm. Thomson & Co. held a public sale on Tuesday, 8th inst., at which they offered the balance of the yellow pine timber, oak, elm and birch, recently landed ex Alagua, from Quebec, and thereafter a varied assortment of Baltic deals and battens. There was a fair attendance of buyers, but a great lack of competition in the bidding, and the waney board yellow pine was with difficulty cleared out at an average price of 2s. 5d. per cubic foot.

GLASGOW.

The *Timber Trades Journal* of Dec. 12th says:—A public sale of deals, result of which is given below, took place here on the 9th inst. The catalogue comprised large parcels of Michigan and Quebec pine deals, Dalhousie pine and spruce deals, California redwood, also birch and whitewood logs, &c. There was a numerous company, but very little disposition to bid was shown, and of the large variety of goods offered only a small portion was sold. Some transactions, however, were made privately at the close of the public sale. The trade, it is likely, will be better prepared for purchasing at the opening of the year.

Recent deliveries of deals and planks from Yorkhill yards, Glasgow, show a falling off compared with last year, the figures being: October and November, 1885, 163,271 pieces, and October and November, 1884, 194,447 pieces.

Cargoes from Canada have now all arrived here for the season, the import list for the past week comprising the closing arrivals from Quebec, viz., those per Magnificent and Choice. Other imports at Greenock for the week have been a cargo of teak and one of pitch pine. The Glasgow arrivals consist chiefly of birch timber and spruce deals. Considering the stock on hand, the import of birch is in excess of the market's requirements.

AUCTION SALE.

On 9th inst., at Glasgow, Messrs. Singleton, Dunn, & Co., brokers:

	per c. ft.
Quebec 3rd pine deals—	
13 ft. 11×3	1s. 2d.
Dalhousie, N. B., pine scantlings—	
9 to 22 ft. 4/6×3	11½d.
Dalhousie, N. B., pine deal ends—	
8 ft. 7/12×3	10d.
5 to 7 " 7/12×3	9d. to 9¾d.
3 & 4 " 5/13×3	7¾d. & 8¼d.
Dalhousie, N. B., spruce deals—	
9 to 20 ft. 11/13×4	10¼d.
12 to 22 " 9/10×4	10½d.
9 to 22 " 7/9×4	10½d.
9 to 23 " 13/15×3	10½d.
9 to 24 " 7×3	8½d.
Dalhousie, N. B., spruce battens—	
10 to 21 ft. 7×2½	8d.
Dalhousie, N. B., spruce scantlings—	
9 to 21 ft. 4/6×3 & 2½	8d.
Dalhousie, N. B., spruce ends—	
3 to 8 ft. 4/15×3	7½d.
Cambelltown, N. B., pine deals—	
9 to 23 ft. 7/15×3	10d.
Campbelltown, N. B., spruce deals—	
15 to 18 ft. 11×3	10d.
10 logs Quebec whitewood (weathered)—	1s. 2¾d. to 1s. 9d.

BOARD OF TRADE RETURNS.

The following are the returns issued by the Board of Trade, for the month of Nov. 1885, and also for the 11 months ending Nov., 1885:

MONTH ENDED 30TH NOV., 1885.

Catarrh—A New Treatment.

Perhaps the most extraordinary that success has been achieved in modern science has been attained by the Dixon treatment for Catarrh Out of 2,000 patients treated during the past six months, fully ninety per cent. have been cured of this stubborn malady. This is none the less startling when it is remembered that not five per cent. of the patients presenting themselves to the regular practitioner are benefitted, while the patent medicines and other advertised cures never record a cure at all. Starting with the claim now generally believed by the most scientific men that the disease is due to the presence of living parasites in the tissues, Mr. Dixon at once adapted his cure to their extermination; this accomplished the Catarrh is practically cured, and the permanency is unquestioned, as cures effected by him four years ago are cures still. No one else has ever attempted to cure Catarrh in this manner, and no other treatment has ever cured Catarrh. The application of the remedy is simple and can be done at home, and the present season of the year is the most favorable for a speedy and permanent cure, the majority of cases being cured at one treatment. Sufferers should correspond with Messrs. A. H. DIXON & SON, 305 King street west, Toronto, Canada, and enclose a stamp for their treatise on Catarrh.—*Montreal Star.* 1y22.

ARE you made miserable by Indegestion, Constipation, Dizziness, Loss of Appetite, Yellow skin? Shiloh's Vitalizer is a positive cure. For sale by Ormond & Walsh, druggists, Peterborough.

CATARRH CURED, health and sweet breath cured by Shiloh's Catarrh Remedy. Price 50 cents. Nasal Injector free. For sale by Ormond & Walsh druggists, Peterborough

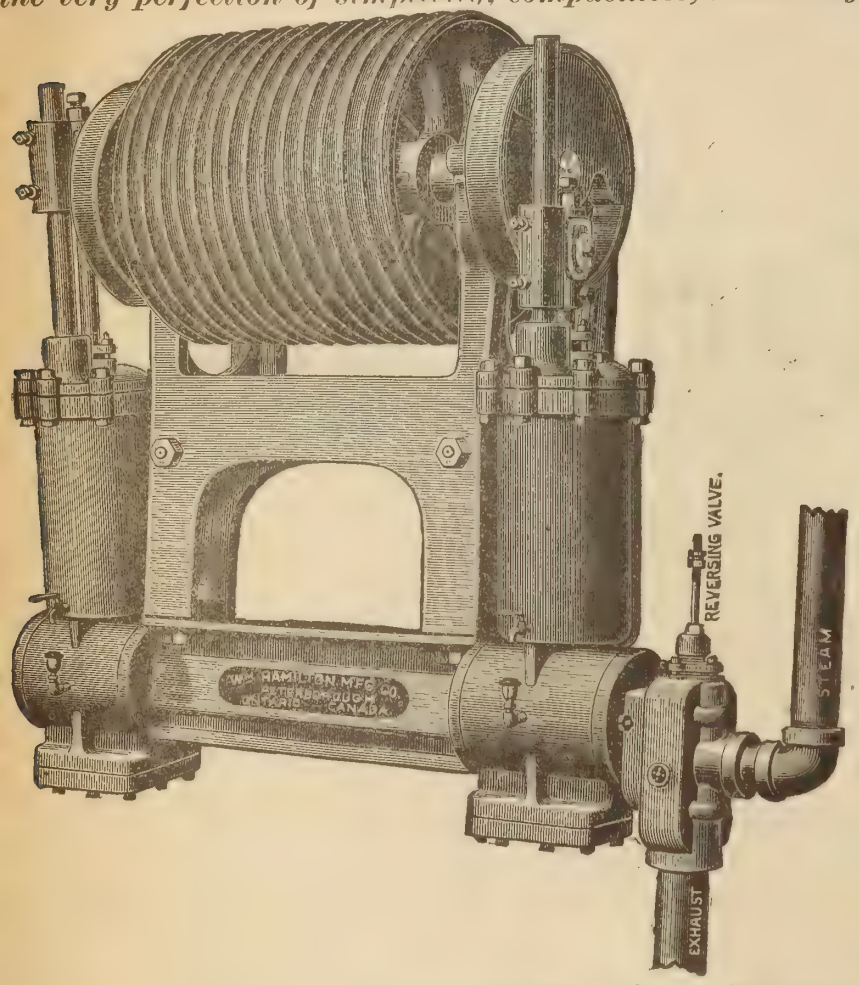
for placing your goods or wares before the saw-mill men and lumber and timber dealers of the Dominion.

CUNNINGHAM'S
PATENT OSCILLATING TWIN ENGINE
FOR STEAM FEED IN CIRCULAR MILLS WITH RACK OR ROPE.

This Engine has practically but two moving parts, aside from cranks and shafts. The whole array of eccentrics, valves, valve rods, connecting rods, cross heads, slides, levers, rock shafts, bell cranks, etc., is done away with, and the very perfection of simplicity, compactness, durability and cheapness attained.



The above engraving illustrates the Twin Engine, 10x16, for Rope Feed, for Saw Mill Carriages. The spool is 27 in. diameter, 30 in. face, is grooved 2 in. pitch for 1½ in. rope. The shaft is steel, 4½ in. diameter, with disk cranks. No connecting rods, eccentrics or valve rods to get loose and out of order. The ports are in the trunions, and worked by an oscilliation of the cylinders, and are held in their place in the downward motion by a steam cushion below. The sawyer's valve is a perfect balance, and by moving this valve the engine can be reversed, stopped or started almost instantaneously if necessary, as the sawyer has perfect control of it by his lever either to go fast or slow. Should the sawyer let go of his lever either by mistake or any other cause, it is balanced so that the valve will come to the centre and cut the steam off both cylinders and stop the feed. When standing, the lever is locked or fastended, so that is is impossible for it to start off itself. The engine stands upright below the carriage, and bolted to two upright beams, placed on the mill for the purpose. When a rack is preferred in place of the rope, we put on a steel wheel 30 in. in diameter, and the engine placed high enough to work into the rack on carriage bar, or if the beams come in the way, an idler wheel can be used between engine and rack segs; or, the engine can be placed at a distance and have a shaft from it to the carriage; or it can be placed in the engine room, where it is under the control of the engineer for oiling, thence by shaft and pinion to carriage rack bars. These engines are well adapted for cutting long logs, or where the logs are mixed, the advantage of this feed will be apparent to mill men. When the carriages are used in two or more sections, the coupling and uncoup ling of each section is quick and simple.

There were two of these feeds working this summer and giving the best of satisfaction, one with rope feed at James Playfair & Co's Mill, Sturgeon Bay, near Waubaushene, and one at the new mill furnished by us to Francis Carswell & Co., at Calabogie Lake, on the Kingston and Pembroke R. R. This mill is working with the Rack and Pinion feed, and drops from fifteen to seventeen stock boards per minute. We have also sent one to the Rathbun Company, Deseronto, to put in to feed their heavy Circular Mills. They will also commend themselves for various other cases, especially for running Elevators, hoisting Engines, and wherever a simple and easily reversible motion is required.

We would also call attention to our Improved Band Saw-Mill for cutting logs

☞ ***We guarantee this to be the best Mill of its kind got up, and would ask any one wanting a good Band Saw-Mill to communicate with us. We would also call the attention of Mill Men to our new IRON GANGS, CIRCULAR MILLS and MILL MACHINERY. For further information, prices, &c., address the Manufacturers,***

VOL. 6. PETERBOROUGH, ONT., JANUARY 15, 1886. NO. 2.

ON THE INFLUENCE OF FORESTS UPON CLIMATE.

At the meeting of the Royal Meteorological Society, held on Wednesday, Dec. 16th, a paper on the above subject, by Dr. A. Woeikof, was read, of which the following is an abstract:—The existence of an influence of forests upon climate has often been contested, and the question remained for a long time unsettled, because meteorologists were content with principles of too general a character. The first step towards a scientific investigation of the subject was taken by the establishment of the Bavarian Forest Meteorological Station, the results of which have been published by Professor Ebermayer. The excellent example of Bavaria was soon followed by Germany, France, Switzerland, Italy, and other countries. As a general result it was found that during the warmer season (1) the air and earth temperatures were lower in the forest as compared with contiguous woodless places; (2) their variations were less; and (3) the relative humidity was greater.

The following details, referring to the amounts of evaporation from April to September, are quoted as being of special importance:

	In the Open. Ins.	In the Forest. Ins.	Percentages.
Eastern France....	16·23	5·20	312
Alsatian Mountains	13 19	6.26	211
Bavaria.....	14·85	6·22	239
Brandenburg.....	15·71	6·42	245
Eastern Prussia...	9·93	4·73	210
Silesian Mountains	10 52	4.17	250

It will therefore be seen that the evaporation from a free surface of water in the open was everywhere more than double, and even above three times that in the forest. In Bavaria, the evaporation from soil saturated with water was observed. This amounted in the same seven months to 16 7 in. in the open, 6·26 in. in the forest without dead leaves, and 2·44 in. in the forest with them. This experiment shows that the evaporation in the open is 6½ times as much as in the forest with the covering of dead leaves. The influence of the forest on the diminution of evaporation from water and ground is so great that it cannot be explained by the lower temperature of the warmer months only by greater humidity, or even by the shade; one influence which has hitherto been too little regarded is especially important in effecting this result, viz., protection from the wind by the trees standing closely together. This last cause is probably more important in its effects than all the others put together.

The diminution in wind force which is caused by the presence of trees is well known, although we have unfortunately no numerical data with reference to it; but it could easily be investigated by the erection of anemometers. It follows also, from the laws of Mechanics, that if this diminution of the wind by forests is especially evident in the lower strata of the air below the tops of the trees, it cannot cease above them, but owing to the so-called viscosity of the atmosphere must extend to a considerable height, so that the motion of the air is weakened up to five or even ten times the height of the trees. This indicates the extent of the favorable influence which forests must exert in maintaining the humidity existing in air or soil; and naturally the denser the forests and the higher the trees the greater is this influence. But if this question is incontrovertible, the same cannot be said of influence of forests upon rainfall, etc.; an influence which is as often asserted as it is denied. Hitherto there has only been one series of observations giving comparable values and maintained a sufficient length of time, viz., that in the neighborhood of Nancy. These observations indicate a considerable influence of forests on the increase of rainfall. The explanation appears to be that in winter the effect of forests upon rainfall should be unimportant in the climate of Central Europe –the difference of temperature and humidity between forest and field being very small, and the amount of vapor in the atmosphere inconsiderable. The observations, however, show that during this season the forests receive much more rainfall, &c., being accounted for by the following facts:—(1) In winter the clouds being of a lower level than at other seasons, the obstruction caused by the forests to the motion of the air must then considerably affect their motion; the air will consequently be forced upwards, and at a time of great relative humidity a small ascent suffices to produce condensation of the vapor. (2) In winter damp winds are more frequent, and the rainfall is of longer duration; hence the greater importance of forest influence In spring and early summer the effect of forests upon the increase of rainfall is much diminished, because at these seasons there is considerable evaporation from the surfaces of fields and meadows; probably more water evaporates then from a given extent of field than from an equal surface of forest, taking into account the evaporation both from the crops and the soil. Towards the end of summer and the beginning of autumn the soil of the fields is considerably dried up, corn is ripe and evaporates but little, while the surfaces of the leaves in the forest still evaporate freely. Conditions then are more favorable to an increased humidity of the air in the forests, their immediate vicinity, and hence to more copious and frequent rainfalls. Other kinds of condensation of vapor for which forests are especially favorable exist. In winter large quantities of hoar-frost collect upon the pine trees, which as the air gets warmer and damper so n falls, increasing the amount of snow on the ground. In warm and moist climates, especially in the tropics, dew collects so freely on the surface of leaves as to fall in large drops and wet the ground. In this manner a considerable amount of the water evaporated during the day returns again to the earth in the form of dew the following night.

Forests retain the water from rain or melting snow much better by the covering of dead leaves, mould and moss, and only allow a portion to run off superficially when larger quantities of water fall; the remainder percolates gradually, and much of it is utilized in evaporation from the trees. Although forests, especially the dense, luxurious forests of the tropics, cannot, of course, exist without a certain supply of water, yet the time when they receive it is of little import to them. A good instance of this is the Lencoran Forest, on the west coast of the Caspian Sea, where vegetation is more luxuriant than in any other part of Europe; for a mass of climbing plants encircles the trees so that it is always humid in the forest, and yet here the rain curve is a subtropical one, very little rain falling in summer, but large quantities in autumn and winter. The water is stored up in the forest, so maintaining vaporation during summer droughts.

In Upper Assam also, during the four months November to February, little rain falls, but the evaporation of the forests keeps the air damp. It would appear that the influence of thick forests of warm regions upon rainfall is such that, if the general climatic conditions are opposed to rain no rain falls, even where extensive forests exist. This is the case when the wind is constantly descending, or blows from cooler and dryer quarters—as from November to February in Assam, when northeast winds prevail. If there is a strong wind from warmer and damper quarters, and especially if it has an ascending motion, the conditions are favorable for rain, whether forest, field or steppe predominates. Weather types are very far from being always so strongly defined. Frequently, in the vicinity of the equator, the winds are variable or local; or calms prevail. Under such conditions dense forests must be favorable to raintall for offering an obstacle to the wind's movement; they cause the air to ascend; since it is already damp, condensation ensues. With the same direction of wind there would be little or no rain in woodless regions. During calms and clear weather, after a long drought, the ascending current over forests is much more humid than that over unwooded districts where the ground is dried up, and vegetation withered. Hence there are conditions again more favourable for rain production; in the former case even calms alone may cause rain with an ascending current; an example of this may be quoted in the case of the frequent afternoon thunderstorms in well-protected Alpine valleys. The correctness of the above remarks is proved by the frequent earlier commencement of rain in the tropical forests.

These considerations show that in the western portions of the Old World extensive forests materially influence the temperature of neighbouring localities. and that the normal increase of the temperature from the Atlantic Ocean towards the interior of the continent is not only interrupted by their agency, but they cause the summer to be cooler in regions situated further in the interior than those nearer the sea.

Hence forests exert an influence on climate which does not cease at their borders, but is exerted over a greater or less district, according to the size, kind, and position of the forests. Hence it naturally follows that man, but clearng forests in one place and planting others in another, may considerably effect the climate. Many incline to the idea that, as forests increase precipitation, it would only be necessary to plant in order to remove deserts from the earth's surface. A person familiar with meteorological questions will, of course, not assume such an extreme position. If the forest economizes rainfall, stores it up for a long time, and even to a certain extent increases precipitation, many parts of our earth are nevertheless too dry to support them, forest vegetation requiring much water. On the other hand, thin forests and such as consist of an excess of waxy trees which diminish evaporation, are certainly able to survive in dryer climates than those consisting of trees closer together, which evaporate more freely; but the former have less effect in moderating heat and drought than the latter. On the other hand the widespread opinion that no forests can exist where none existed at the time of the appearance of civilized man is open to doubt. The success of forest culture in the Stepps of Southern Russia, the prairies of North America, and the Pampas of South America sufficiently prove the untenability of this opinion. If afforestation has not hitherto assumed large dimensions, it is more as a question of economy rather than one of climate.

Other growths, such as corn, or the use of the land for pasture, &c., have been more remunerative to private individuals—human life being of but short duration as compared with that of trees.

If there be only a certain amount of rainfall, no matter at what time of the year it occurs, forests flourish. Even long periods of drought are much less injurious to forests than to meadows and fields; and the impossibility of forest culture in a country is not due to the occurence of rainless periods, provided that copious precipitation falls in other months.—*Timber Trades Journal.*

A LOGGER by the name of Johnson, working in a camp near Ogontz bay, upper peninsula, Mich., was accidently shot for game by a fellow workman named Lewis Gotlip. Johnson was hit in the back of the head and died instantly.

BRITISH TRADE.

There is a general admission of a bad trade, and the Government returns to some considerable extent corroborate it, as these columns have had to record; but whence its source no one seems able to determine, nor from what quarter relief is to come. All eyes are at present turned towards America, because it is understood that business is really reviving there, and it has heretofore been found that the state of trade on one side of the Atlantic, whether for good or evil, when a change comes, is soon reflected on the other. But we must not forget that the rival industries of America are in a constant process of development, and that with each returning year she exports more of her own manufactures and imports less of ours; so that we are bound to entertain only subdued expectations from that quarter of the world. Nor is there any steady upward movement as yet discernable in sympathy with the repnted revival of business in America. On the contrary, evidence of unabated depression continue to force themselves on our notice.

The latest is a report of the shipbuilding trade in Glasgow for the last as compared with the two previous years, and it confirms as far as that enterprising port or entrepot of northern trade is concerned the view now so univer sally prevailing, that even in favored localities our national industries continue to lose ground. We learned from the Glasgow *Herald* on the 19th that during this year 241 vessels of a total capacity of 193,458 tons were launched, as compared with 296,854 last year, a falling off in this important Glasgow industry of 103,396 tons, which is suggestive of a loss of employment to thousands of artizans, as the deficiency would mean the discharge of as many men as could build within the twelve months more than 100 ships of over a thousand tons each, as well as so much loss of trade to those who supplied last year the materials, steel, iron, timber, &c., &c., to construct such a fleet. Yet this would have been considered an immense business as lately as 1879, when only 174,750 tons were launched on the Clyde. But in 1883 the tonnage supplied there reached 419,764 tons, of which the present return is short more than half.

Notwithstanding this decline in the trade, the boiler-makers' and shipwrights' societies of the Tyne and Wear sent their delegates to a meeting last week, in reference to a notice of a 12½ per cent. reduction of wages being given by the employers, and it is stated that it was unanimously resolved not to submit to any further reduction, either on time or piece work, so that another strike and disorganization of the labor market may be looked for in that quarter shortly. Two and six pence in the pound seems certainly a rather formidable reduction on a week's wages at one slap. But the men might be sure it signifies one of two things: either that the masters have not sufficient work on hand to keep the men employed at a profit to themselves, or that their returns will not justify their going on at their present rate of expenditure; and neither case is the wisdom of a strike very apparent. The slate quarrymen at Llandulas have a better chance of obtaining a concession from the masters, because slate can only be obtained from certain districts; but shipbuilding interrupted in one port flies to another. The housebuilding trade, all over the country, also depends very much on the slate quarries of North Wales, and the owners, or those who work the quarries at a royalty, may by and by reimburse themselves fer an advance of wages by raising their prices, if the strike continues long enough to produce a brisk demand, but this does not apply to shipbuilding, where the stoppage of the work for any length of time may destroy the reputation of the port, and cause it to be shunned by shipowners, who want vessels for a special purpose, to be completed in a specified time.

And if we look to the East, instead of the West, there is not much to reassure us. The news from Burmah is not quite so favorable to a speedy opening of a large trade on the Irrawaddy as it looked when the great success achieved by General Pendergast and our troops by capturing the King and apparently putting an end to the war was first published. There appear now to be some further difficulties, and armed insurgent bands, by land and by water, have to be put down before much regular business can be established on the upper reaches of the river, and our supply of teak is not likely to be either increased or cheapened for some months to come. Perhaps the reverse, for it always happens that while a people are in a disturbed and unsettled state the industries of the country are greatly interrupted and neglected. No doubt we see only the brightest side of the picture at this distance, as it is presented to us by the victors. There is evidently a great deal of work to be done by our generals and diplomists out there before trade will be established on a good working basis. Even Rangoon may depend for much of its supplies on the native craft, or lumberers, bringing the teak down the river; and though every facility will doubtless be afforded by British cruisers, native confidence will probably be wanting till the administration is settled. If the native merchants are not afraid of British interference with the river traffic, they may be doubtful of marauding parties composed of their own people, for public disorder and political revolutions are the opportunities of desperados in all communities.

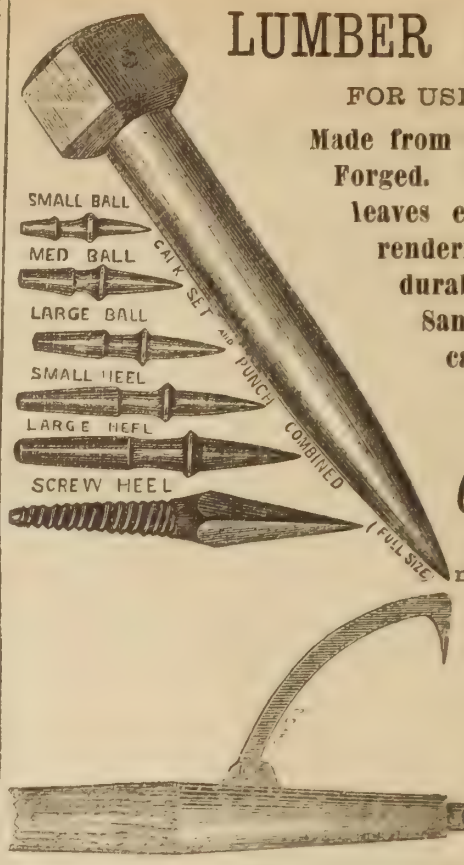
The close of the year being now upon us, and the Christmas holidays, at this present issue, in full festivity, the timber and building trades have settled down into their customary quietude at this season. On all sides we are admonished that the year's work is done, and nothing new in the way of business will be undertaken till 1886 puts in its appearance, and imparts new hopes to those who have despaired of a trade revival during 1885. It is not yet time to reckon up the business of the year, but we may take a survey of the distribution of our timber imports up to the end of November, as these form a good index to the state of business in the various parts of the kingdom to which they refer themselves, and altogether form a body of useful information to be obtained, for the moment, in no other work, not even from the Board of Trade publications.

Though the imports up to the end of November exceeded by 154,933 loads the supply of timber goods at that date last year, very little of the excess had found its way to great depots of the trade.

London, the Leviathan of the realm as a swallower up of cargoes, is not accountable so far for a stick of the excess. For the month of November, it is true, it took in some 43,000 loads more than the November preceding; but in the total reckoning for the eleven months it is more than 30,000 loads short in the comparison. It must not on that account be concluded that we are without a sufficient supply here. On the contrary, though keeping within such reasonable limits, London is as well prepared for a better demand, probably, as any part of the country. Liverpool in like manner is well within bounds. It has only just turned the corner by less than 2 000 loads, and cannot therefore be accused of overtrading in timber. One year (1877) Liverpool imported more than half as much as London, but never since. The difference now between these two great emporiums is about in the proportion of 13½ to 6. But London apart, there is no other port that approaches the timber trade of Liverpool. Hull which is next in dignity, has also to acknowledge a slice of the surplus over its last year's import, up till the end of November; till which return it was in arrear. Now it stands in advance by about 30,000 loads. But this is more than off-set by Cardiff, which is above 40,000 loads behind. The greatest spring appears to have been made by Grimsby, which if not a chief timber port seems to be fast becoming one, and fully alive to all the local advantages it possesses. Of the excess aforesaid, Grimsby has seized the huge cantle of 63,000 loads—like a young Hercules throwing a bullock across his shoulders, and walking off with it, as if there was nothing remarkable in the circumstance. Hartlepool just maintains its ground modestly, as if in no hurry to put forth its strength. It is even about 17,000 loads short of last year, and finds itself nevertheless in tolerable good case to meet any improved demand likely to take place when the days get longer. Newport (Monmouthshire) has its trade well in hand too, as if doing a steady business a little within the mark by abont 4,000 loads less than twelve months ago. If not a spring Grangemouth may at least be said to have taken a long, a very long stride, that is, from 127,000 to 174,000 loads. But Grange mouth has a heavy duty to perform, as Glasgow looks to it for its east country timber goods, and therefore 40,000 loads more or less is no great object to that small but ever busy port of the Firth of Forth. Sunderland has gone ahead by 7,000 loads; and Swansea has fallen in the rear by 10,000, while Greenock has taken a cut in of 17,000 loads, and increase rearly of of nearly 20 per cent. on the figures of last year, and Leith 13,000 loads. Montrose is perhaps flooring trade in better heart for 10,000 loads of the surplus have gone there. Newcastle, suffering from the general complaint of poor trade, and not at above letting us know it, has, nevertheless, taken a small surplus of 8,000 loads to carry on with. It is one of those places which are always busy, but which in the busiest time delights to complain that it has not half enough to do. Thus its figures do not always correspond with its lamentations.

Most of the Scotch ports, besides those we have mentioned, have imported short, and likewise all the Irish ports of any note except Waterford and Dublin. Even Belfast is 6,000 loads in arrears, and has dropped far astern of the capital with which in the timber trade it used to compete. Dublin up to date has imported more than four times as much as Belfast, and the southern ports look very small indeed in the comparison. It will be seen that already the total import up to November 30th, wanted but a trifle of 6,000,000 loads; and it needs no divination to forecast that the December returns are not likely to fall far short of those for the same month last year, as to the timber trade, so that the supply is pretty sure to be a full average one, upon the whole. And it is greatly to the credit of the trade that with so large an importation, on a very dull year, it goes on just as steadily as if the business to be done was as good as ever. But it has at least provided itself with the means to do a good trade, and though, as we have said, few signs of it present themselves to us on the surface, they may work upwards in a short time, and be palpable to us all. According to American ideas, we ought to congratulate ourselves that the bank raised its rate of discount from 3 to 4 per cent. last week. They argue that a cause of dull trade is a cheapness of money. This does not quite conform to the experience of our own country; but if we find that the rise of bank rate is no check to business, we shall be half inclined to adopt their theory.

Four per cent. may possibly be the happy medium, the palladium of trade, the talisman of safe business. To be very high at, 6 or 7 per cent., we *know* is bad, and at under 2 per cent. our cousins over there say it is so. Between these two extremes there is possibly a middle term in which trade especially rejoices. Let us hope that our great financiers will hit upon it ere long, and that the trade of the new year may be more prosperous than that of the one which is now taking leave of us. It will yet be something to be thankful for if we find it no worse.—*Timber Trades Journal.*



LUMBER DRIVERS' CALKS

FOR USE IN STREAM DRIVING.

Made from the Best Refined Tool Steel and Forged. The method used in tempering leaves every one of the same temper, rendering them stronger and more durable than any other Calks made. Samples and prices free on application to the undersigned.

THE

Orono Cant Dog

Strongest and Lightest in the market. Made of Best Cast Stee by drop forging process. The Handles are made of best quality straight grained split and turne Rock Maple, 5 to 6 feet in length, bored specially to suit the pick. Prices on application.

MANUFACTURED BY

T. McAVITY & SONS,

ST. JOHN, N.B.

L2

WOOD-WORKING PATENTS.

The following list of patents relating to the wood-working interests, granted by the United States Patent Office, December 29th, 1885, is specially reported by Franklyn H. Hough, solicitor of American and Foreign patents, 925 F. Street, N. W., Washingston, D. C.

333,295—Dove tailing machine, automatic switch for—C. Graff, Logan, Utah Territory.

333,228—Sash fastener—J. Hutch, Canton, Ohio.

333,240—Sash or door fastener—C. Longbottom, Bradford, County of Cork, England.

333,191—Sash weights, chill mould for—B. Anderson, Urbana, Ohio.

333,438 — Sash, window— L. L. Arnold, Buffalo, N. Y.

333,339—Saw guide—H. W. Roberts, Duncan City, Mich.

333,244 — Saw mill, set works for— T. J. Leacy, Milwaukee, Wis.

PATENTS ISSUED JAN 5.

333,604—C. M. Stevenson, Syracuse, N. Y.

333,664— Saw mill carriage— T. W. Peck Milwaukee, Wis.

333,843—Sawing machine, fire wood—I. Gill more, Dewitt, Iowa.

333,562—Saw table gauge—D. W. Standeford, Oakland, Cal.

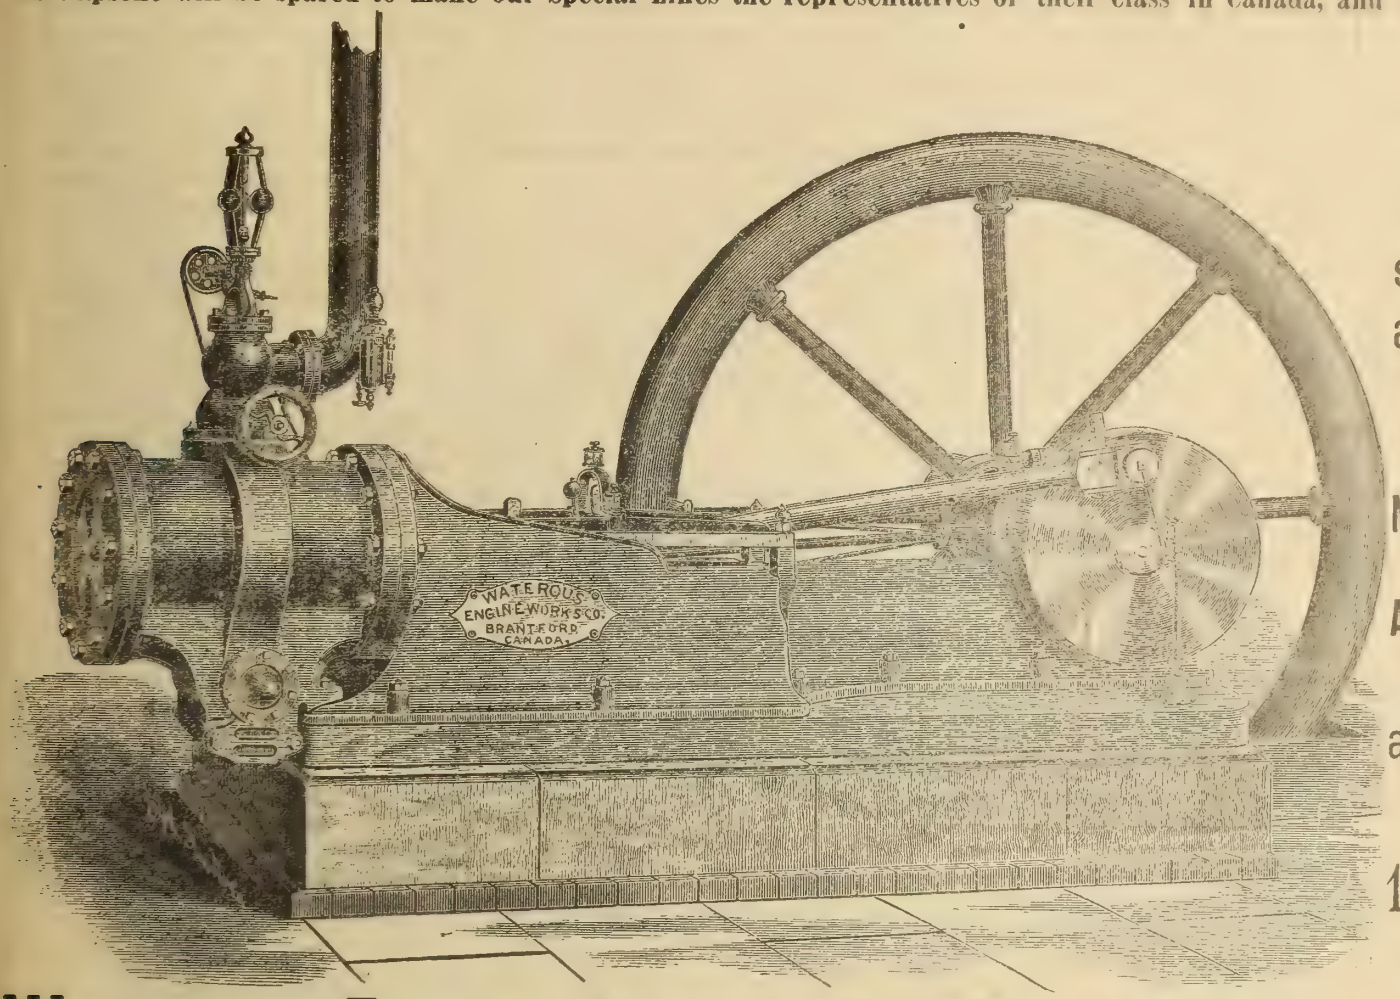
333,777— Saw Buck—H. Palmer, Banon, Conn.

J. D. Tully, druggist, will gladly inform any one inquiring of him of the wonderful results of West's Cough Syrup. It is an unfailing cure for all throat and lung diseases, coughs, colds, hoarseness, influenza, consumption in its early stages, and whooping cough. Price 25c., 50c. and $1 per bottle.

Heavy Substantial Saw Frames, Carriages and Engines

BEST MATERIAL AND WORKMANSHIP.

No Expsene will be spared to make our Special Lines the representatives of their class in Canada, and the best that can be made.



Send for New Illustrated Catalogue No, 14, devoted specially to Saw-Mills and Saw-Mill Machinery Box Board Machine, Veneer Machine, New Shingle Machine.

Ask for No. 12 Circular 60 pages, on Saws and Saw Furnishings.

EASTER OFFICE:—
154 St. James Street,
MONTRAL.

Waterous Engine Works Co., Brantford and Winnipeg

LUMBERMANS PRINTING AND STATIONERY.

We can supply anything in the line of BOOKS, BLANKS or STATIONERY for Lumber Shanties and Offices at City Prices, and everything necessary to a complete office outfit
All PRINTING done in the Highest Style of the Art, and at Lowest Living Prices.
BOOK-BINDING of every description got up in a Neat and Superior manner.
ACCOUNT BOOKS Ruled and Bound to any desired pattern.

Address: "THE CANADA LUMBERMAN" Peterborough, Ont.

J. BAXTER, M.D.
M.R.C.S., Edin.
OFFICE—135 Church-St., TORONTO

Special treatment for Impoverished and Exhausted conditions of the Nervous System, Loss of Energy and Power, Neuralgia, Sleeplessness, Nervous Headache, Paralysis, Epilepsy, Dropsies, Diseases of the Heart, Kidneys, Bladder, Ulcers of long standing, Obstinate Skin Diseases and all Chronic Medical and Surgica cases successfully treated.

Twenty-three years' experience in Hospitals, Prisons, Asylums, etc

BOOKS IN FINE BINDINGS

Full Calf, Half Calf, Full Alligator, Half Alligator, Flexible Leathers, Half Russia, Full Sheep and Cloth Bindings

AT THE REVIEW BOOK BINDERY

LIGHTNING'S AMONG THE TREES.

All who have been in a forest during a thunder-storm have witnessed the pranks of lightning among the trees. An English engineer who spent several years in this country thus writes on the subject: During surveys in the forests of the United States, when I necessarily lived under canvas, I often had the opportunity of witnessing the effects of lightning on the trees, and my experience lead me to believe that trees are only destroyed by lightning when they have been previously wetted by the rain.

A sojourner in the woods, whether he is taken in pursuit of game or with the object of prospecting for timber, minerals, and land, is always careful to erect his tent under a short thick tree in order to escape the danger of lightning or of trees falling and bringing down others in their way on him; and it was often while thus situated I noticed after stormy nights when thunder and lightning were accompanied by rain that many trees had fallen. The report of the snapping of the trunks would remind one of that of the firing of a cannon, and when lightning and thunder were not accompanied by rain (in the immediate locality of our camp at any rate) no trees had been struck. I infer from the same observations that the lightning always strikes the tallest trees, whatever their species may be, for the taller white pines and poplars were most often seen destroyed and the shorter maples, linden, birch trees, etc., rarely so; also that the sap between the wood and the bark of the tree does not increase the chance of its destruction.

A gentleman connected with the new botanical gardens suggests that the mete-rological offices in different countries collect reliable data embodying the observations of different persons as to the particular circumstances attending thunder storms during which more or less injury has been done trees. He states as the result of his own observation that certain kinds of trees are much more likely to be injured by lightning than others, which goes to show that they are very poor conductors of electricity. The condition of the tree in regard to age and vigor has also, in his opinion, much to do in making it a good or bad conductor. In a communication to a London paper he says: The comparative conductibility of different trees is not wholly, in my opinion, a question of species. The same species at different stages of growth, and growing under different circumstances, will exhibit widely different degrees of conductibility.

Doubtless the hardness of the wood and the character of the grain, and also the character of the ramification, have much to do with that resistance to the electric fluid which results in damage to limbs or trunk. Hence, probably, why the oak, which is remarkable for the general closeness and hardness of its grain, and the ruggedness and contortion of its ramification, so frequently suffers, while soft-wooded trees, like poplars, escape. But younger oaks under the same circumstances might escape, while the older and harder and drier trees would be broken by the electric fluid. A mistake commonly made is to speak of certain trees being "struck" by lightning, the word "struck" being only applied to those trees that are injured by lightning. Thousands of trees are struck during every thunder-storm that takes place over woody country; but, being struck noiselessly and without resulting injury, they are not noticed. It is doubtless the superior or inferior conductive power of a tree which subjects it to, or exempts it from, harm from lightning; but it is the greater or less moisture of the branches and trunk which regulates the conductive power.

The form of a tree, too, has much to do with its exemption from hurtful strokes. The Lombardy poplar is about the best form, because its branches, pointed upward, are like so many lightning conductors. The oak is about the worst form, because its branches and limbs are nearly always (in those trees which are mostly damaged) placed across the course of the electric fluid. The Lombardy poplar also is of much moister and softer substance than the oak, and consequently gives freer passage to the electricity.

The best conductors of electricity are not those that are "struck" by a discharge from a cloud, but those which silently convey it to the earth without being shattered or injured in any way. That many trees do this seems certain. In all probability trees whose leaves present many sharp points are the best conductors of electricity. Each point attracts electricity, and is the means of directing it through the branch and trunk to the earth. The amount conveyed by each is so small that no part of the tree sustains any damage. Leaves like those of the holly tree are admirably formed for attracting electricity. The points on the foliage of fir are of the desired shape to attract electricity, but the resin in the fir tree serves to make it a poor conductor.

In a flat and nearly level country like our western prairies lightning does not always "strike" the highest objects. It sometimes enters the side of a building instead of discharging itself on the chimney, the highest place on the roof, or other projecting point. The presence of suitable trees next a house, or at some distance from it in the direction toward the course of the prevailing thunder clouds, would serve to protect the dwelling. Trees that are better conductors than the materials of which buildings are composed would protect them as well as metal rods.—*Chicago Times.*

OPPORTUNITIES FOR WASTE.

In a large establishment where several batteries of boilers are at work to supply the steam consumed, we are waiting for shutting down time to commence work upon the engine. Strolling around the building a large drop of very hot water upon the neck compelled attention to a large valve overhead, from the stem of which issued a jet of steam which would have been a decided improvement upon the performance of some safety valves we know of, together with numerons drops of the hot water aforesaid. Moralizing upon this outlet for the escape of heat without the performance of useful work, our thoughts went out over the long line of opportunities for waste which exist in the ordinary steam plant. One of the most prolific of these is the blow-off. Leading as it usually does by closed pipes to some concealed drain, a very serious leak may exist at this point without attracting the attention of an unobservant attendant. Our first experience in this line was in a printing office, where the boiler and engine were in charge of the pressman. One day the boiler worked badly. The fire was driven and coal shovelled with commendable energy, but frequent stoppages had to be made for steam. The state of affairs baing called to the attention of the manager, he declared the boiler to be dirty, ordered the fire hauled, and to show his practical acquaintance with the subject shut down his roller top desk, stripped off his coat and bathed in soot, ordered the boys about and raised a general hubbub for half an hour, when the boiler was pronounced all right. Meantime the writer had noticed that the pump was running although the draught of steam from the boiler had stopped, and that when the pump was stopped the water lowered in the glass. The blow off valve appeared to be closed when tried, but the pipe beyond the valve was hot, showing that hot water from the boiler was passing the valve. The valve was opened wide, then closed tightly, the water stood stationary in the glass, and the continual drain of heated water, caused probably by a bit of scale under the valve, being stopped, the boiler did its work nicely when started up, to the infinite delight of the manager who of course laid it to his clearing.

Another favorable opportunity for hidden waste is in those establishments where the circulation of pipes for heating is connected so that the exhaust may be used in it. If the exhaust valve is not tightly closed when live steam is on the building it will find an open passage through the exhaust connections into the open air.

About the engine are two little opportunities for waste, the first of which should be on its face so apparent that its frequency is surprising; that is the practice of allowing the drip cocks to remain open while the engine is running. Although it must be apparent to the operator that an opportunity is thus afforded for steam of the cylinder pressure to blow directly to waste, it is a very common practice with the runners of small engines. The second is more occult and less liable of detection, though we have met with a number of instances of it. We allude to the exhaust valve being late in closing, so late that it does not close until after the steam valve has been open for some time, allowing, of course, the live steam to blow through the exhaust port and out.

Another source of waste lies in the uncovered pipes which abound in places where the heat which they radiate is rather an annoyance than a desideratum. Every square foot of this surface is radiating heat uselessly into the atomosphere instead of retaining it to be conveyed to the engine, and converted in part, into useful work, and how much steam may be condensed in a long whistle pipe exposed to the weather and allowed to stand full of steam instead of being shut off as it should at the boiler.—*Boston Journal of Commerce.*

SHAFT BEARINGS.

In numberless instances, says *Iron Age*, shafting is found small in diameter in proportion to its length, even as regards the distance apart of its supports, and far more so regarding the shaft as a single rod, which from the method of uniting its separate lengths, it becomes. Such a bar, even before pulleys are put on, is anything rather than straight. The load of the pulleys puts it still more out of true, and then finally come both the dead-weight of half the belting driven by it and also the diverging strains of the loads on the driving sides of the belts. All these make a length of shafting serpentine, and this is increased in proportion to the distance of this or that pulley from a bearing. Hence it follows that the bearings must and do suffer; so also does the oil bill and the coal bill. Another source of friction and brass-cutting is to be found in the methods sometimes observable of fixing the hangers or brackets, such as bolting to joists or flooring overhead, either of which is subjected to constant variations of load and consequent alterations of line, or bolting to the members of an iron roof or its supporting columns, which are in perpetual movement by expansion, contraction or from wind stresses. In many cases there is no better way practicable, but then the evil can be met by putting up shafting in independent lengths, each having its own pair of supports and transmitting the rotation power by universal joints, or the simpler expedient of cross-ends plain on one end and "taken on to" by studs or pins fixed on the other cross end. It is probable that not one steam user on a large scale in a hundred can tell how much power is absorbed in overcoming preventable friction in his shafting. Yet it could easily be ascertained. We may also point that brass is used far more freely than is necessary for lay shaft beams. Hardwood, such as hornbeam or beach, is much better and cheaper when the loads are not too heavy. Wood bearing will run for years. They soak up oil and come to a beautiful surface, and they never cut a shaft, as brass will do. The virtues of wood are not understood as they ought to be.

THE POPLAR.

In an article on "The Future of the Poplar," a contemporary observes: As is well known, for a nation of shopkeepers a large number of packing cases have to be annually made, and as, in most instances, these cases are only used once, cheapness and lightness for carriage are great essentials, and these the poplar possesses in eminent degree. For cases in which very heavy weights have to be packed, such, for instance, as tin plates, where a cwt. of metal goes into a box about 20 in. by 14 in. and less than 2 in. deep, it is not so suitable as the elm, as it lacks its strength and will not stand such hard knocks. When it is considered that the tops and bottoms of these cases go at three boards in thickness to the inch this will not be greatly wondered at. There are, however, vast numbers of cases wanted in the drapery, grocery and similar trades, and for such purposes the poplar seems peculiarly suited, as, in addition to the qualities of cheapness and lightness of which we have spoken, it is very white and clean in appearance, and has no properties in it likely to cause injury to the articles packed within it. For such uses there need not be an atom of waste, since left to grow on naturally, and it is not attacked and lopped by the pruner's knife and saw, the poplar produces sound timber and free from knots, and there is no appreciable difference between the heart and sapwood, and the limbs are practically as good as the bole itself; under these conditions it is a very economical tree to cut up. Besides being useful for the packing-case maker, it is suitable for the turner, not perhaps for the more elaborate or lasting work, but for rollers, so extensively used in what our American friends would term "dry goods stores." The same qualities which recommend it for packing cases would be equally applicable here, and no imported wood possesses them in the same degree. Another use to which it is occasionally put is for benches and tables for leather cutters. For this its softness is a great advantage, but in the matter of grain there are woods more suited; but as they are scarcer, and consequently dearer, they have to be dispensed with in favor of the poplar.

THE INVENTOR OF THE CIRCULAR SAW.

In a lonely, secluded spot in the northwest corner of the cemetery, near the ever beautiful little village of Richmond, Kalamazoo county, Michigan, the reader can find, on a pure white marble slab, nearly concealed from view by a large cluster of lilac bushes, engraved the simple inscription "Benjamin Cummings, born 1772, died A. D. 1843." And who was Benjamin Cummings? He was the inventor of the circular saws now in use in this country and in Europe. Nearly sixty years ago, at Burtonville, New York, and Amsterdam, this man hammered out, at his own blacksmith's anvil, the first circular known to mankind. He was a noted pioneer in Richmond; a first cusin to one of the presidents of the United States; a slave owner in New York state; a leading mason in the days of Morgan, at whose table the very elect of the great state of New York feasted and drank freely of his choice liquors and wines; a vessel owner on the North River before the days of steamboats; a captain in the war of 1812, where, after having three horses shot from under him, with one stroke of his sword he brought his superior officer to the ground for insult, and because he was a traitor and a coward; and after being court-martialled, instead of being shot, he was appointed Colonel in his stead. In this lonely grave are the ashes of the man who, nearly 70 years ago, took up and moved bodily large brick buildings, and, to the wonder and admiration of the world, constructed a mile and a half of the Erie Canal through a bed of rock, and who also built, on contract, those first low bridges over the same. He also aided in the construction of the first ten miles of railway built in the United States, and founded both the villages of Esperence and Boatonville, on the old Schoharie, near Amsterdam. The study and aim of this man's life appeared to be to do that which none other could accomplish, and when the object sought was accomplished, he passed it as quietly by as he could the pebbles on the sea-shore.—*Ex.*

A Good Week's Log-Making.

AYLMER, Dec. 30.—The following work done by one gang of four men, under the management of Mr. George Guertin, in one week on the limits of N. E. Cormier, on the south branch of the Petewawa river, is worth noting. These four men, Moses Thibault, Cyrille Jeauvine, John Renaud and Alfred Perrier cut in six days beginning Monday, Dec. 14th. the following saw logs: Monday, 160; Tuesday, 166; Wednesday, 170; Thursday, 173; Friday, 171; Saturday, 168; total, 1,008 sawlogs, average diameter 16½ inches. The same 1,008 logs were laid up on ten rollways (besides making the rollways) in three days by two teams driven by O'Rooke, Guertin and Tom Guertin, 1st day, 356; 2nd, 307; 3rd, 345; total, 1,008.

DECEMBER 25th, during a thick fog, the British bark Arabella, lumber laden from Montevideo, South America, while in tow of the tug Pilot, went ashore on the rocks at Trail Island, a few miles from Victoria, B. C. Both vessels stuck fast, and the Arabella became a total wreck. She had 500,000 feet of lumber on board.

Chips.

WILD land in Franklin county, N. Y., which a local paper in that state describes as "some 7,800 parcels," was sold lately for $600,000.

DAVID GEROU was instantly killed on Jan. 1st, near Blenheim, Ont., by the limb of a tree striking him and breaking his neck.

THE E. B. Eddy Manufacturing Company, of Hull, P. Q., have made application to Parliament for a charter through Messrs. Gormully & Sinclair.

FOREST fires have lately raged in Pope county, Ark., and considerable damage has been done to pine and other timber, especially on the hills and mountains.

AN addition of about forty feet is being built to the south side of Mr. Peter McLaren's circular sawmill at Carleton Place. The new building will contain the necessary machinery for manufacturing dressed lumber.

THE bark Arabella, lumber laden for Australia, while in tow December 25th, went ashore on the rocks off Trial Island a few miles from Victoria, B. C. At last reports it was thought that the vessel would be a total wreck, but that a portion of the cargo might be saved.

FOLGER BROTHERS have purchased the charcoal works at Sharbot Lake, Ont. In the property is included 2,000 acres of woodland.

THE Port Arthur Lumbering Company, at Port Arthur, Ont., has been exempted from paying taxes for five years by a by-law of the municipality.

WE understand that Messrs. Bryant, Powis & Bryant, Limited, have acquired the well-known business of Messrs. Carter, Tyer & Parker, of 15, Canada Dock, Liverpool, and intend to carry it on at the same place, under the title of the London firm as a branch house.

NEVER put resin on a rubber belt. If it is a new one, it will cause the rubber to stick and accumulate on the pulleys, and eventually ruin the belt, and further, when resin has been applied for some time it will form a glazed, hard surface, causing the belt to slip out more than it did before the application was made.

THE operators in cedar, says the *Northwestern Lumberman*, are the men who seriously feel the effects of an open winter. Cedar has the habit of growing in swamps mostly. An early freeze, before snow gets deep, is a great advantage to the cedar industry. There will be a good demand cedar next year, and soft weather a large part of the season may serve to stiffen the market. There is, however, generally cedar enough to supply the demand.

IT is stated in a foreign exchange that a company is about to establish large works in St. Petersburg, for the purpose of making rails from paper. The paper is subjected to great pressure, and it is said that the material is extremely durable, and can be produced at one-third the cost of steel rails. A further advantage would be in their lightness, not only on account of the saving of the cost of carriage and laying, but also because they could be made in longer lengths than is the case at the present time, therefore the number of joints will be fewer, and consequently less oscillation to the carriages, and the wear and tear to both permanent way and rolling stock reduced to a minimum. A greater adhesion also would be offered by these rails to the driving wheels of the engine, and the working expenses reduced accordingly.

THE St. John, N. B, *Globe* says that Mr. H. R. Robertson has invented a new description of raft, differing from any at present in use. This raft in shape resembles a cigar, being round and brought out to a point at both ends. He has got out patents for it in Canada, the United States and in several countries across the Atlantic. Several New York lumber dealers confident that the raft will be a success, have made arrangements with Mr. Robertson to ship their logs by this means, and Mr. Robertson, with that end in view, has contracted with Mr. B. B. Barnhill to have the raft constructed at Two Rivers, N. S. It will be ready for launching in May next. The raft will contain about four million feet of timber, composed of piling, piece sticks, spars and poles, about 800,000 feet of hardwood suitable for wharf logs. Everything that enters into the construction of the raft can find a ready market in New York, and so no danger is anticipated in towing. Mr. Robertson expects to make a big thing out of it.

FOR SALE,
TIMBER LIMITS & SAW MILL
THE MASKINONGE LUMBER COMPANY offer for sale their property consisting of Saw Mill at Maskinonge Bridge, P. Q., within quarter mile of N. S. Ry. Station, also good facilities for shipping by water. Capacity of Mill 50,000 feet per day, water and steam power; saws and belting all complete. Two hundred and forty square miles of limits situated about thirty miles from Mill, which are interseeted by a number of good driving streams, and are rich in Pine, Spruce, Cedar, etc. Satisfactory reasons for selling out.
For further particulars appiy to

Office, Wellington Street, OTTAWA. 1Lt

Valuable Timber Limits
AND
SAW MILL PROPERTY.
THE SUBSCRIBER WILL SELL HIS TIMBER LIMITS and Saw Mill property, at Cowichan, British Columbia, and if purchased by a Company, will invest a large amount of price in shares.
The Limits are supposed to contain about two hundred millions superficial feet. (An estimate is now being made.)
The Timber is mostly Oregon Pine of an excellent quality. The average haul, only about half a mile to floatable water. The run thence to mill, 30 miles.
Full particulars furnished on application.

Johnston's Fluid Beef

The nourishing, palatable and warmth giving qualities of Johnston's Fluid Beef has caused this invaluable preparation to before a favorite and fashionable beverage for the winter season. It is now obtainable on draught at the leading hotels and restaurants throughout the Dominion 1aL7

Wrought Iron Shanty Cook Stoves
The Best Article Ever Offered to the Trade.
I have much pleasure in drawing attention to my **WROUGHT IRON COOKING STOVE**, for Shanty, Hotel and Boarding House use. These stoves are made of **Heavy Sheet Iron**, the top and lining of the fire-box being of **Heavy Cast Metal** and all the connecting parts of substantial **Wrought Iron Work**. The dimensions of these Stoves are as follows:
SINGLE OVEN STOVE
Top surface contains six 10-inch holes, with ample room between, and one oven 28 x 24 x 19. Fire box takes 28-inch wood.
DOUBLE OVEN STOVE
The Double Oven has a top surface containing twelve 10-inch pot holes, with two ovens, each 28 x 24 x 19. One fire-box of suitable size for area to be heated. Below will be found Testimonials from some of the leading Lumbermen, who have used my **Wrought Iron Cook Stoves** since I commenced manufacturing them. They are the names of gentlemen who are well known and reliable, and will carry more weight than any recommendation of my own could do.
The Best Stove I have ever Used.
PETERBOROUGH, May 31, 1880.
ADAM HALL, Esq., Peterborough. Dear Sir,—I have used your Wrought Iron Cooking Stove in our lumbering operations since its introduction here, and have no hesitation in saying that I prefer it to any other. For durability, economy and efficiency, where a large number of men are employed, it is the best stove I have ever used. You can, with confidence, offer it to hotels, boarding houses and lumbermen.
Yours truly, THOS. GEO. HAZLITT.
The Stove for Lumbermen.
PETERBOROUGH, June 1st 1880.
ADAM HALL, Esq., Peterborough. My Dear Sir,—We have used your Wrought Iron Cooking Stove and find it is very satisfactory for lumber operations, especially so on drives. We can recommend it highly.
Yours truly, J. M. IRWIN
In addition to the above I can refer you to the following lumber firms who use my Wrought Iron Range exclusively in their camps:—
THE GEORGIAN BAY LUMBER CO.....Waubaushene
THE LONGFORD LUMBER CO.....Longford Mills
MESSRS. GILMOUR & CO.....Trenton and Ottawa
MESSRS. RATHBUN & CO.....Deseronto
THE MUSKOKA LUMBER CO.....Gravenhurst
EVERY STOVE GUARANTEED.
All the necessary TINWARE and CUTLERY for Shanties Supplied at the Lowest Prices.

Communications intended for insertion in the CANADA LUMBERMAN, must be accompanied by the name of the writer, not necessarily for publication, but as a guarantee of good faith. Communications to insure insertion (if accepted) in the following number, should be in the hands of the publishers a week before the date of the next issue.

The CANADA LUMBERMAN is filed at the Offices of MESSRS SAMUEL DEACON & CO., 154 Leadenhall Street, London, England, who also receive advertisements and ubscriptions for this paper.

PETERBOROUGH, Ont., JAN. 15, 1886.

MR. CHARLES SERENY, an Ottawa lumberman, is believed to have been drowned in Lake Nipissing on Jan. 6th.

THE Morrison mill, at Fredericton, N. B., s being rapidly rebuilt. The main building is 42x125 feet, and the annex 14x90. The boiler house is 33x75.

JAS. DOLLAR, of Bracebridge, has purchased from the Muskoka Mill and Lumber Co. all their half of the township of Perry, containing 41¾ square miles.

THE Gibson tannery in New Brunswick will probably be started up next year, when the hemlock lands on the Nashwaak have been rendered accessible by the Miramichi Valley Railway.

THE lumber dealers of New York city are endeavoring to form a lumber exchange. It is said that the yearly trade of the port (in lumber we presume) reaches the large total of $60,000,000.

THE Minden, Ont., *Echo* says that some big work is being done in the shanties this winter. A few days ago five of Irwin's men, for scorers and a hewer, made 900 feet of board timber in one day. Mr. Joseph Hughes, of Anson, is the man that done the hewing.

MAITLAND N. S., ship yards turned out during 1885 eight sea-going vessels, five of them being barges averaging 1,100 tons, the others a barquentine and two brigantines. There are two now on the stocks at South Maitland, 1,200 and 1,800 tons respectively.

INCLUDED in the improvements to be made at Coal Harbor, the terminus of the Canadian Pacific railway in British Columbia, is the clearance of 60 acres of land, which is so heavily timbered that it will cost $200 an acre The company is also to let contracts for furnishing 45,000 ties and 2,800 piles. There will be lively times among the timber men at that point as a result of the operations of the railway company.

IT is reported from Duluth that Osterhout & Fox are making arrangements for the purchase of 60,000,000 feet of pine on the south shore of Lake Superior, contiguous to Duluth. This pine will be logged for stocking the firm's mill at Duluth.

THE total length of railway laid in the United States during 1885 was 3,113 miles, 700 miles less than the new mileage of 1884, but more than was predicted at the beginning of the year. The larger proportion of the new mileage was branches and extensions.

As an example of a novel mode of transporting lumber by water on the Atlantic coast, we have aireadly referred to the raft building by Mr. B. B. Burnhill at Two Rivers, N. S. It is 400 feet long, 30 feet wide at the ends and 50 in the middle, 28 feet deep. It will draw 20 feet of water. The cost of towing the raft to New York is estimated at about $6,000. Its building, including getting out the timber, will give employment to a hundred men for the winter.

G. S. C. writes in energetic terms to ask "if it is possible that Canadians send to Indiana for such things as toboggans." because he has seen advertised outside of a shop door in Toronto "Indiana hickory toboggans," and wonders at Canadians letting Yankees run away with such a peculiarly Canadian branch of manufacture. Our patriotic correspondent may calm himself; the goods he refers to were made in Hamilton; the hickory may be Indianian, but the toboggans are Canadian. Our people are not likely to be surpassed by the Americans in such goods as appertain to our winter sports and their costume.—*Monetary Times.*

ON Jan. 7th an accident occured at James King's shanty, near Mud Lake, by which one man lost his life and another was seriously injured. Two men, James Mangan and another whose name is unknown, were felling a tree, when it lodged. In attempting to get it down, a heavy limb was in some way detached and it fell with terrific force, striking Mangan on the head and his companion on the shoulder. Mangan's head was so terribly crushed that he ouly lived twenty minutes after the accident. His companion was paralyzed on one side, but is still living. He may possibly survive although it is doubtful.

HINTS TO SAW MILL MEN.

In these times of close margins, stagnation of business and low prices, the mill-men have had to work hard to make both ends meet. All kinds of business men have suffered by the dull times more or less, but few as keenly as the saw mill trade. The smaller mills not having the capital needed to buy at the lowest figures, and, being for the same reason unable to atone by large sales for the narrow margins of profit, have suffered much more than the large factortories, and it is to the owners of these small mills that this article is particularly addressed

It is with great difficulty that the poor mill owners can obtain a poor subsistence, pressed and harassed as they often are with notes due, and maturing for this and that, and the other. But "It's an ill wind that blows no one any good." The pressure brought upon the saw mill men has had its effect, and to-day many of them are in better shape than ever before to make money, as soon as there is a revival in business circles. The continued low prices have taught the thrifty mill-men, how to produce lumber much cheaper than would have seemed possible to them a few years ago. "Necessity is the mother of inventions," is a saying that has proved very true in the saw milling business the past year or two. There has been no alternative. It was a necessity to produce cheaper or sell at an absolute loss. Mill men h ve had to put on their "thinking caps" and study how to cut off and shut down expenses. It was a little here and there and everywhere, but the aggregate saving is wonderful.

Belts that have been rejected, thrown one side as past service, are now unearthed from some pile of rubbish, the best pieces cut out and trimmed up and made over, and so good, serviceable belts are produced at very little expense. The stretch is out of them, and in this respect they are preferable to new ones. Files that were worn out and left anywhere around the mill, are now gathered up and re-cut, reducing the file bill 50 per cent. There is place a to keep the old file now, that a value is atached to them. In one corner is found a lot of old saws of all sizes, shapes and conditions. They have taken up valuable room for years, but the time has come when they are to be classified and cleaned up. Many of them are worthless, but quite a number need only re-teething, and a gauge or two ground off from them to make excellent saws for small work. The hole possibly may be too large for the small mandrels, but the slight expense of a bushing is nothing in comparison with the expense of a new saw.

Among this miscellaneous lot of old relics are found two or three large saws with a crack in them three or four inches deep. There is not a drill-press or machine shop within miles, but there should be a good rachet, and a small hole drilled through the saw where the crack stops, will prevent it going any further, and with care the saw can be made to do good work. Several of these old saws have the teeth filed nearly off them and need gumming badly, or more properly re-teething. One or two are "buckled" badly, and are waiting for some time when they will be sent to the shop. Quite a number are thrown out into the scrap pile, and the entire lot classified and disposed off, with the result of saws enough for the entire mill for a year or two, at a small expense of repairing, straightening, re-toothing, etc. It is not the purpose of this article to recommend putting dangerous saws into service, as that is not true economy, but it is still a fact that with care a damaged tool may often be made almost as good as new.

Lacing is picked out from short and rejected pieces of belts oiled to soften it and used again In another corner of the mill are found old cant hooks which in some way became unserviceable. There are two or three axes without handles; one has the eye split beyond use. This corner has been a cemetery for broken and disabled tools and machinery, for as sure as an article was once thrown into it, it was practically buried without even a tombstone to mark its whereabouts. Truck wheels, old pulleys, pieces of belt, scraps of chain, short pieces of rope, a disabled wheel-barrow, a few remnants of T rail, and a pinch bar or two, are all lying together in this corner. And with but slight expense, many of these old tools could be made serviceable. All this truck is taking up valuable room, and in a short time it becomes a fixture and necessitates going around a pile of trash where much time could be saved could this room be utilized.

And many mill men have discovered this They have also learned that journals that jump up and run hot, can be babitted and adjusted Belts too light for the work required of them are replaced by those more suited for the work expected. Loose belts are tightened and made to do full service. Belts with many pieces are made over, thus avoiding the jump that numerous laps will make. Loose pulleys are babbitted when needed, and not allowed to rattle. These little details are all receiving the closest attention. The tendency is to save and utilize that which has been bought and paid for, and so reduce expenses.

Piece work is brought into use where it is possible to do so. The logs are cut, hauled, or bought at the bottom figure. More care is used in the selection, to reduce the common and increase the better qualities. Special bills receive closer attention, so that the proper quality may be furnished and the sizes kept exact. It is poor economy to ship, especially long distances where freight is high, any material to take chances upon. If it is sawed too large, re-saw it again. Don't ship it, paying freight upon worthless material and excessive weights, which make the lumber undesirable for the consignee and unprofitable for the shipper. Strange as it may seem a reckless way of sawing and shipping in the past has cost the mill men many dollars. But he is giving points closer attention now, learning the wants of the customer and trying to supply just those wants.

He is looking into the market more to find ways to work his lumber up more advantageously.

New machinery has been investigated, its merits enquired into and compared with the old in use. Dull as business has been, the only way to lessen expenses materially is to keep up with the latest improvements in labor-saving machinery. No push and hurry expended on poorly constructed machinery will enable the mill man to keep pace with competitors who are better equipped. The "thinking cap" must be kept on to keep pace with a progreasive age. Now the saw mill men are not all loose in their mode of doing business, but many of them can but admit that there was a time when they were, and that it was chiefly the dull trade of the past two years which brought them up to a better standard. They have learned economy and the lesson fits them for better times, and if the lesson is not forgotten, prosperity will surely attend them.—*E. B. Chester in Saw Mill Gazette.*

IN BY-GONE DAYS.

Mr. W. H. Murphy relates the following lumbering incident which it will be seen ocurred a good many years ago. "Fifty year ago just about this season of the year I was employed getting out timber on the Eardley mountains. We were short of pork and as I had some business in Bytown, now the city of Ottawa, I was commissioned by the boss to call on my way down at Mr. Egan,s office in Aylmer and have some pork sent up. I saw Mr. Egan and a day was set that I was to call and take the pork on my return. On the day appointed I was on hand and Mr. Egan informed me that I was to take a horse and tram, three barrels of pork and a large sack of oats. I started with my load over the Eardley hills and arrived at what is now and has been for many years known as Breckneredyes' place. There was then a stopping place kept by a Mr. Moor. I put my load under the shed which was then just about where Mr. Breckneredyes' hou e now stands. Mr. Moor's house was on the opposite side of the road and has long since, no doubt. dissappeared. I had not been long in Mr. Moor's when a large gang of portageurs who had been deleriving supplies to concerns further up, came along. In those early days it was usual to travel in gangs, as there was often trouble with ice and snow storms. The teamsters would come in in threes and fours as they passed along, but they did not stop. The horses understood their business, and would follow along. When the last of them had passed, I thought I would take a look at my load, and it was well I did so for my sack of oats dissappeared. There was no way it could go other than some of the teamsters had thrown it on to their sleighs. I acquainted Mr. Moor of my loss, He could, of course, suggest nothing. Here I was in a fix. I could not take the horse to the shanty with nothing to feed him, and besides, it would be a standing joke on me that I could not bring a load from Aylmer without losing a part of it. I could see the last of the teams slowly wending their way up the hill. My determination was soon taken, and I started after them. When I got up to them I jumped into the last tram, turned it round, and brought it back to Mr. Moor's. I got back and asked Mr. Moor if he had a gun, all I wanted was my property and they could have theirs. The suggestion to take back the tram to return the oats did not meet my approbation. I had made no allowance for that on my programme, which was to hold the horse till I got my oats. Seeing that I was determined they thought the better way was to return the oats, so starting back for them in a short time they returned with the sack. I gave them their horse and tram. As I handed Mr. Moor his gun he remarked, "Well, that's the best I've seen done in these parts."—*Ottawa Free Press.*

An Age of Discovery.

We certainly ought to appreciate the fact that we are living in an age of progress and discovery, this is especially appreciated by all persons that have been afflicted with rheumatism, as West's World's Wonder or Family Liniment is a positive cure for rheumatism. It is invaluable for cuts, sprains, bruises, burns, scalds and all diseases requiring external application. Sold by J. D. Tully at 25 and 50 cents per bottle.

HARRIS, HEENAN & Co.

124 AND 126 QUEEN STREET, - - MONTREAL.

Patent Stitched–Steam Power Pressure Stretched–Oak Tanned

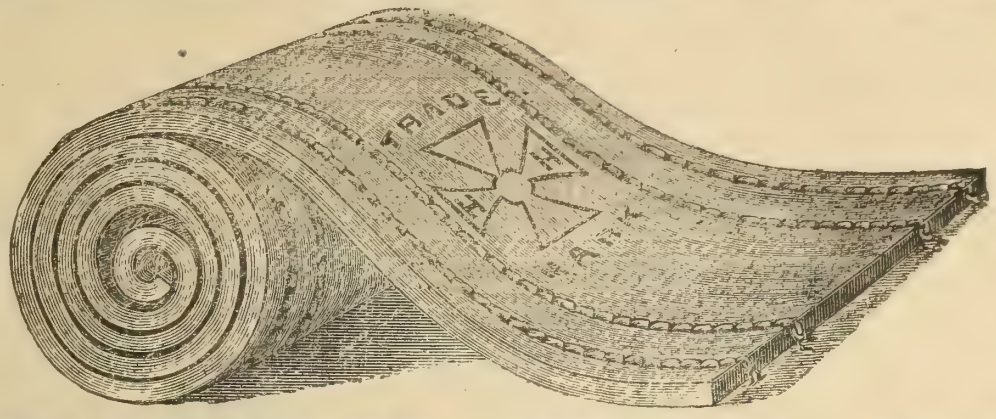
TESTIMONIAL.

IRA GOULD & SONS, CITY MILLS,
Nov. 13th, 1884.

Harris, Heenan & Co.

DEAR SIRS,—Your Patent Sewed Belt has been in use in our "City Mills" for some time. We are thoroughly convinced of its superiority over any belt, American or Canadian, we have used in an experience of over 35 years. It stretches so little, and gives so little trouble, that compared with riveted belting, the sewed belt saves double its price in time and laces saved. We heartily recommend it to manufacturers as the cheapest and most satisfactory belt in the market

Yours respectfully,
W. C. MARSHALL,



TESTIMONIAL.

PAGE, BERRY & Co., CANAL HORSE SHOE AND NAIL WORKS, MONTREAL, 15th Nov. 1884.

Messrs. Harris, Heenan & Co., Montreal.

I have pleasure in recommending the belting manufactured by Messrs. Harris, Heenan & Co., of this city. After thoroughly testing it, I find it greatly superior to any belting that has come under my notice and fully equal to all they claim for it, and certainly without an equal for cross or double belting.

CHAS. R. ELLACOTT,
Supt. H. S. & H. N. Dept.

LEATHER BELTING!

The Best, therefore the Cheapest, Belt in the market.
Replaces, when used, all others.
More Pliable and Durable, especially at the splices.
Stretches but little, always retains it original wid h.
Superior for Cross or Double Belts.
Runs sraight and true, does not start at the laps.
Single equals medium double.

25 per cent Stronger, 33⅓ More Lasting, and 12½ Heavier, than any other Leather Belt

MAPLES ELM AND OAK.

Maples, elms and oaks, generally classed as deciduous trees, formed the subject of a recent talk by Prof. A. S. Bickmore to the public school teachers at the American Museum of Natural History. The lecture was the second of a series on the vegetable Kingdom. The science of forestry, it was said, began first to be studied in Germany and to-day Germany leads all other countries in that particular. Her wooded territory has been carefully surveyed, and maps have been arranged showing the kinds of trees found in various quarters. All the forests are under the immediate protection of Government. Only a limited number of trees are allowed to be sacrificed each year, and an officer of the Government directs the particular trees to be felled. The same condition of things exists also in France, and as a result the income from the forests is increased. The public interest taken in the preservation of forests in Germany and France was contrasted by the professor with that taken in our own country.

The extreme northern limit of territory where deciduous trees are found in the country was fixed as the St. Lawrence river and the region about Lake Superior. There is a broad area of deciduous forestry extending southward across the United States, bounded on one hand by the Atlantic ocean, and on the other by the prairies. A comparatively narrow strip stretches from Lower California up the Pacific slope. The structure of the leaves of these trees was explained in detail, showing how they act as breathing organs to the trees in a manner closely analogous to the working of the lungs in the human body. The sap of the tree rises from the roots between the bark and the solid trunk, circulates through the branches and thence through the twigs to the stem of the leaf. From this point it is spread throughout the leaf in the veins. The fruit of the tree is engendered by the falling of grains of pollen from the male flower upon the stigma of the fertile flower.

The white oak, Prof. Bickmore said, is the kind generally used in manufacturing furniture and in commerce. Its elasticity and durability is what gives it value. Cork is simply the the bark of a species of oak which grows in the vicinity of the Mediterranean. In oak forests where bark is cultivated, a series of circles are cut about the trunk when the tree reaches its 15th year. The circles are connected by longitudinal cuts, and the bark is then pried off in large sheets. The first crop is of little value, but a second coat of bark comes, which is of a finer quality. Trees may have the bark removed half a score of times and lives to the age of 150 years before decay sets in.

Attention was called to the veneration for the oak which has been shown in times past by the Druids and others. The Druids worshipped in oak groves, if, in fact, they did not worship the trees themselves. This veneration was accounted for the fact that the trees, aside from their natural beauty, were exceedingly useful. They furnished food for man and the lower animals, and material for boots and bows. In a certain part of Palestine, it was stated, may still be seen an old oak tree which is said to be the oak of Abraham. "I can't say that the tree actually existed in Abraham's time," said Prof. Bickmore.—"It is hard for a scientist to believe that any tree now in existence dates back so far." The oak family includes the chestnut, beech, and hazelnut trees, and both oaks and elms are a sub-order of the nettle family.

The most beautiful, graceful and dignified tree in all the vegetable kingdom was said to be the elm, and the professor expressed pleasure at the fact there were so many of them in Central park.—*New York Times.*

SHIP BUILDING ON THE MERSEY.

The shipbuilding trade on the Mersey during the year now closing has been comparatively slack; and, so far as present appearances go, the prospects for next year are not encouraging. Messrs. Laid Bros., Birkenhead, have built the following vessels this year :—The steel paddle steamer Ireland, 1,951 tons gross register and 850 horse-power; the steel twin screw steamer Britannia, 1,524 and 250 horse-power; the iron twin screw steamer Stormcock, 372 tons and 300 horse-power; and the iron screw steamer Blackcock, 220 tons and 200 horse-power. In addition to building the above vessels, Messrs. Laird Bros. have effected several heavy repairs and alterations in ships and machinery. Messrs. R. & J. Evans have built the following vessels :—The iron sailing ship Westgate, 1,920 tons; the iron sailing ship Alliance. 993 tons; and the iron lightship Star, 195 tons. Messrs. W. H. Potter & Sons have constructed the following :—The iron sailing ship Marlborough Hill, 2,578 tons builders' measurement; the iron steamship Hecate, 1,350 tons; the iron twin screw steamer Alarm, 250 tons; the iron sailing ship Langdale, 2,150 tons; and the iron steamer Medusa, 1,350 tons. Messrs. Thomas Royden & Sons have the following list :—The iron steamer Britannia, 3,129 tons gross and 1,400 horse-power; the iron sailing ship Queen of England, 2,119 tons; the iron sailing ship Glenesslin, 1,821 tons; the iron sailing ship Buccleuch, 2,054 tons; and the iron sailing ship Glenericht, 2,400 tons. Messrs. Cochran & Co., of Birkenhead, have built a large number of lighters, launches, steam tugs, &c., the total gross tonnage being over 2,000.—*Timber Trades Journal.*

A MUCH USED BUT LITTLE KNOWN WOOD.

"Did you ever wonder what knife-handles are made of?" asked a dealer in fancy woods of a New York *Tribune* reporter as he hauled out a shapeless block from his store of spoils from many tropical forests. "Outside of bone and tortoise shell and pearl, so called, which every one recognizes, the majority of knife-handles are made out of a close, fine-grained wood, about the name and pedigree of which 9,999 out of 10 000 persons are ignorant. It is known to the trade as cocobola wood, and it comes in large quantities, millions of pound a year, from Panama. It is of special value for knife-handles because of its close texture, freedom from knots and flaws, and consequent disinclination to split. Many well-known kinds of wood require varnishing and polishing and filling up of crevices before they attain the beauty for which they are famous. Of course that sort of thing cannot be done in the case of knife-handles, and something must be used which doesn't require fixing up. Cocobola is rarely used for cabinet-making, because, being a gummy wood, it doesn't glue well. The same qualities that make it of use in the manufacture of knife-handles render it valuable for the making of wind instruments like the flute. It comes to us in chunks, not in strips and planks like other woods. Sometimes these pieces will weigh 500 and 600 pounds, but generally much less than that. It costs 2½ cents a pound now, but before freights went down and the isthmus was opened up so thoroughly it used to cost double that price."

WORTH MORE THAN GOLD.

The eyes of the northern mill men are turning eagerly to the comparitively virgin forests of the south, and heavy sales of timbered land are constantly being announced. If the ravenous saw must be fed, and no better and cheaper material than wood can be devised, then the people of the south should not dispose of their heritage for a mere pittance of its actual value. These huge tracts of yellow pine can be converted into yellow gold, and should not be sacrificed as a worthless possession. We should make the most of our opportunities, and not yield too rapidly to the pressure of greenbacks. These huge areas of undisturbed trees are daily enhancing in value and importance as the supply in the North and West diminishes. It is idle to talk of the "inexhaustible" forests of the South, when Mr. Little of Montreal, an authority on the subject, estimates that the sawing capacity of the North is sufficient to consume the merchantable pine of this state in less than a year. The South posseses mines of wealth in her noble forests, and they should not be disposed of carelessly, and without a full appreciation of their true and real value.—*Florida Herald.*

NEW BRUNSWICK INTERESTED.

To the Editor of the Canada Lumberman.

SIR,—I took notice in your valuable paper of the 15th Dec. two very sensible written letters, —one by Manufacturer, and the other by Hon. H. G. Joly. Manufacturer shows in plain language our lumber manufacturers are in danger of being drifted on lee shore, by allowing the Americans to take the wind out of our sails; allowing them to cross the boundary and float away our lumber unmanufactnred to their own shores to be manufactured, encouraging labor and capital to help build up their country out of our material, and charging us $2 per M feet duty if we attempt to compete with them.

I trust not only manufacturers, but farmers, laborers, mechanics, and men of all classes will put their shoulder to the wheel and cry out against the unfairness of the Dominion to allow Americans yearly to rob us of our staple article, with no restriction or recompense, for one and all are interested in the matter, and if we allow Americans to follow up with impunity a few years more, to cross the lines and slaughter our forests, one-half of our manufacturers of lumber will be driven into bankruptcy, and their fine costly establishments closed and decaying Labor is the wealth of any country, and so long as we allow our forest to be snatched from us to go on the American side to be manufactured, just so long we are giving Americans a premium to oppose our lumber industry, and unless our manufacturers' advice is at once taken by our Dominion to put on the same export duty on our raw material going out of the country to the American side to be manufactured, that they charge for our manufactured article going into the United States, we may expect to be left on the lee shore, and our lumber trade stranded in a very few years.

I may remark that its not only Ontario that is in danger now, all above the Grand Falls, in New Brunswick, American and English capitalists have, and are contemplating building mills to cut our cedar and what few spruce we have left. Inside of five years there will be but little if any worth cutting if they go on at the rate they are now cutting. And in Nova Scotia they strip it of its lumber by building immense large rafts and tow them with powerful tugs to the United States ports to be manufactured.

The Hon. Mr. Joly's remarks on forestry are worthy of particular attention, and every man owning an acre of land should plant more or less of some sort of trees, and report for the benefit of humanity, and try to cultivate a taste to improve tree growing and forest protection, nd demand of our Governments to put a stop American capital coming over to slaughter our forest as we want it all for Canadians. And we cannot wonder at the American press saying our Dominion politics does more to drive emigration to their shores than all their own politicians and emigration schemes yet been tried.

It has been customary with our politicians to lock the door after the horse has been stolen, and likely the same old groove will be followed for the future.

Most respectfully yours,
P. O. Byrom.

Madawaska, N. B., Dec. 1885.

THE FORESTS OF SIBERIA.

The Russian journal of *Finance Minister* has published a long article on the forests of Eastern Siberia, of which the following are the principal passages:—"The immense forests of pines, larchs, cedars, birches, aspens and limes which form almost the exclusive wealth of this region, belong for the greater part to the State. During a great number of years this source of wealth was almost entirely unproductive. It is only since 1869 that a more or less regular administration of forests has been established, and at the present time the extent of the forests in Eastern Siberia are estimated at 72,335,230 deciatines (about 11 square yards each.) These are divided between Tobolsk Tomsk, Semipalatinsk, and Akmolinsk. Of these forests, 21,355,760 deciatines have been accurately surveyed, and 50,979,570 have been valued very approximately One hundred and five forests have been conceded to the peasants, and they have an extent of 7,068,240 deciatines. In comparison with their enormous extent the forests of Eastern Siberia give at the present time but an insignificant revenue. The want of means of communication, and an insufficient population, greatly hinder its development. Still, the revenue is increasing, for in 1876 it was only 40,000 roubles, and in 1884 it was more than 111,000. The chief centre of the trade is in the town of Tomsk, and then Tumen, which is point of departure for the river traffic."

QUARTERED OAK.

For the past two years quarter-sawed white oak has gradually been grown in favor, and the present demand is largely in excess of any previous demand for years. The thickness most used is inch, and it is worked into flooring and general house finishing. The furniture manufacturers are using quite an amount for dining tables and sideboards, and the manufacturers of desks and chamber sets use limited amounts. The beauty and value of quarter-sawed oak is in the figure, and takes more than ordinary sawyer to cut the log to the best advantage. Only the largest and best logs should ever be quartered, as a most desirable feature in such stock is to secure clearness and width. The eastern market will take quartered oak, five inches and up wide, but the buyers also place the value on a car load by the amount of lumber that is over 12 in. in width.

The best length to cut quartered oak is 14 feet, although there is a demand for more or less 16 feet, and for such a good price is easily obtained. The demand for thick oak is limited, and the price is usually from $3 to $4 per M. more than for boards.

Quartered oak should always be square-edged, and piled in such a manner as to dry out perfectly straight. An eighth of an inch should always be allowed in the sawing, so that the boards will dry out to full thickness.—*Timber.*

QUEBEC TIMBER AND LUMBER EXPORT.

"The past season has been one depression in all branches of commerce, and the lumber business of this port forms no excep ion." Such is the opening sentence of Messrs. J. Bell Forsyth & Co.'s lumber report for 1885. The circular states that the arrivals from sea of both steamships and sailing vessels show a slight increase over last year, while the tonnage from the lower ports is also in excess. The total supply of timber measured, by the returns from the supervisor of cullers, was as under:—

SUPPLY.

Year 1885.....9,000,000 feet.
" 1884.....8,250,000 "

EXPORT.

Year 1885.....10,500,000 feet.
" 1884.....9,000,000 "

STOCK WINTERING.

Year 1885.....11,750,000 feet.
" 1884.....12,250,000 "

These figures show a great falling-off during the past ten years when the average export of white pine alone was over 12 million feet. In deals, taking pine and spruce together, the export has been slightly under that of the previous year and the stock wintering rather more.

The accounts from Great Britain show a considerable reduction in the consumption of Canadian timber, and the imports, though light, have been more than ample for the requirements; from all quarters a dull market is reported.

WHITE PINE.—Waney board—The quantity measured, some of which has been in the coves for a year or more, show a heavier supply than last year, and the stock on hand slightly in excess of that wintering a year ago. Fresh timber of choice quality has been in good demand all season at our highest quotations while old or inferior has been entirely neglected. The stock comprises some choice girthy wood, also a larger proportion than usual of old, small and inferior.

DITTO SQUARE.—The supply has been the lightest since 1879, when it was reduced to 2½ million feet, the export light, and the quantity wintering, though less than last year, about an average of the past five. A fair demand existed during the early part of the season especially for choice or new rafts, some of which were placed at high figures, while for old and inferior wood there were no buyers except at greatly reduced rates. Towards the autumn enquiry almost ceased, the shipping houses manifesting no disposition to add to their light stocks. The rafts on hand are to a greater extent than usual held on manufacturers' account, though only three or four new lots are comprised in this list.

When we issued our last circular a number of rafts, the production of 1883 and 1884, were laid up on the Ottawa in readiness for the spring market; these have reached the coves, as well as the manufacture of the past winter, so that the stock now wintering—which includes much inferior wood—is all that can be counted on as available for the spring fleet. From latest advices the production will be extremely light this winter.

	Supply. 1885.	Export. 1885.	Stock. 1885
Square	2,820,045		6,651,604
Waney	2,876,753	6,758,240	2,588,603
	Supply. 1884.	**Export. 1884.**	**Stock. 1884.**
Square	3,707,159		7,501,529
Waney	2 199,867	6,047,680	2,399,001

RED PINE.—The supply has been almost nil, owing to the scant demand and low prices of past years, the export fair and the quantity on hand less than one-third of the usual average with a good deal of old and inferior wood in stock.

	Supply.	Export.	Stock
1885	73,766	644 160	473,136
1884	327,738	614,280	1,012,426

OAK —The supply has been double that of 1884, the export greater and the quantity wintering more than sufficient for all early requirements. Prices opened steadily, with a downward tendency and a weak market towards the close of the season. The only wood now readily sold in this market is choice in quality and make, and manufacturers cannot be too particular in this respect. The quantity wintering at Garden Island is small. Sawn oak exported from the United States to Great Britain is in many ways now taking the place of square timber.

	Supply.	Export.	Stock.
1885	1,566,968	1,526,400	1,078,051
1884	772,250	1,212,520	837,715

ELM.—Notwithstanding the difficulty in securing standing timber the production last winter was heavier than usual, the export larger and the stock on hand greater than for some years. The demand has been fair but the closing prices easier, owing in a great measure to the heavy stock. It is estimated the manufacture this winter will be greatly curtailed.

	Supply.	Export.	Stock.
1885	1,018,932	884,160	560,453
1884	657,919	658,000	114,961

ASH.—The receipts and exports have been light and the wintering stock heavy. It contains a large amount of old timber unsuitable for shipment and useful only for sawing up for local consumption. Good wood is held at our highest rates, while inferior is unsalable and neglected.

	Supply.	Export.	Stock.
1885	287,595	262,480	428,635
1884	451,984	360,080	389,358

BIRCH.—The shipment has been large, the quantity wintering very light. Prices have been fairly maintained, and for parcels of good average there has been a fair demand.

	Supply.	Export.	Stock.
1885	379,059	457,160	22,138
1884	194,346	241,120	23,038

STAVES.—This branch of the Quebec business which once formed so important an item of export will disappear from our stock list altogether if the decrease continues in the same ratio for the next few years.

The present stock of pipe is equal to the export of the last two seasons, while that of puncheon is considerably less.

	Supply.	Export.	Stock.
1885—Pipe	144	152	349
1885—Puncheon	186	469	310
1884—Pipe	96	183	379
1884— Puncheon	261	700	474

DEALS.—Pine has been in good request, especially for specifications containing fair proportions of first quality and broads, which have been scarce all season, and have commanded extreme rates. The enhanced quotations for all the higher grades of lumber in the United States will not only curtail the shipments of Michigan deals to the St. Lawrence, but must also attract a larger proportion than usual of choice Canadian lumber suitable for deals to that market. From all appearances prices are likely to be well maintained, and may rule even higher for next year's delivery. The export has been slightly under that of last year, the stock wintering rather heavier; including, however, a larger proportion than usual of culls and odd sizes. We learn that the shipments from Montreal have increased considerably this season.

	Supply.	Export.	Stock.
1885	2,666 240	2,376,737	955 648
1884	2,247,240	2,442,946	847,653

SPRUCE.—For some weeks in the early spring a brisk demand existed, attributable, however, more to the fact that the fleet arrived almost simultaneously and that the mills, owing to the lowness of water, were unusually late in getting to work. As the season advanced prices dropped, but towards the close of navigation considerable sales were made at fair figures. We would, however, urge our mill men to curtail the supply, as we are convinced that if the manufacture be excessive the present healthy tone will not be maintained.

	Supply.	Export.	Stock.
1885	2,535 324	2,473,529	822,632
1884	2,222,557	2,636,465	838,817

Freights have ruled low all season. opening at 20s. to 22s. 6d. Timber, 47s. 6d to 50s. Deals to Liverpool, 20s. to 22s. 6d. Timber, 50s. to 52s. 6d. Deals to London, 17s 6d. to 19s. Timber, 45s. to 47s. 6d. Deals to Greenock closing at 18s. Timber, 45s. Deals to Liverpool, 20s. Timber, 45s. to 47s 6d. Deals to London, 16s. 6d. to 17s. timber, and 45s. deals to Clyde.

THE BAND MILL.

The interest in band saws does not abate. Owners of good timber see the necessity of making the most of it. Good pine is too valuable to throw away in sawdust. The time was when the thickest circulars were thought to be the best saws. They were durable, easily run, and the wide kerf was no objection. Gangs were not introduced as timber savers particularly; the saving they made was a consideration with some, but the fact of superior manufacture was the prime object.

The oldest operators in the field are the ones who are now giving the most thought to band saws. Years of experience have taught them that by the older methods of manufacture what would otherwise bring to them many dollars goes into the refuse heaps. They plainly, and forcibly see that this is poor policy. They are also aware that their pine possessions are growing smaller year by year. They want to make the most of the last of it. It is often said—and we all know it by experience—that a person never fully appreciate a friend until that friend is gone. So it is with pine. When it was plentiful, and could be had at $1.25 an acre of government for asking, it was not appreciated. Its value was underrated. In a strictly commercial sense it was worth only what it would bring, but its prospective value was much greater. The latter value was what was considered by the cautious and far sighted, as is proved by the fortunes at which several holders have recently disposed of their timber.

That band saws, almost without number, will be put in as soon as possible, admits of no question. It can be said that there is a craze for them, but it is backed by common sense, and strictly business principles. The machine that will pay for itself in a few months is considered a good investment, and we believe a good band saw will do that. The man who can change his methods of business and make $1.25 when before he made but $1, will naturally, as soon as possible, place himself in a position to secure the extra 25 per cent. If he can do this by using a band saw, instead of a circular, he is certainly excusable for being an enthusiast.

The men who do not wish to adopt band saws are those who cut coarse stock mainly, and who are obliged to turn out large quantities of it, in order that their business may be profitable. A small output of lumber of low grades rarely pays. There is but small profit on a thousand

feet, consequently the more that is manufactured and sold the better. But this objection is entirely done away with as soon as good lumber is considered. A gain of from 20 to 35 per cent. in the amount of lumber turned out, in favor of the band saws, is a prime object, when such logs produce good lumber. What, for instance, would have been the result, if up to date, the Wolf river stock had been manufactured by band saws? Much of the timber cut on that river was exceptionally fine, as high as $20 a thousand having been paid for logs, yet these logs have been cut with circulars. The waste of timber has been so great that had that waste been sold as lumber, as a large portion of it would have been had thin blades been used, fortunes would have come from it. Old operators have in mind just such cases, and while they cannot undo the past they are determined to do better n the future.

There has been a doubt in the minds of many manufacturers as to the feasibility of using band saw mills. This not to be wondered at. The outcome of any prominent innovation is always doubted by many. The old, if not so good as the new, is, as a general thing, clung to by the majority. We believe there is no manufacturer of band saws who will say that his machine is perfect; still there are band mills doing excellent work, day after day, as figures, published from time to time in these columns, prove. And after all it may turn out that there are better mills on the market than many give them credit for being. Along in the fifties, somewhere, the first circular that was put in a Manistee mill was discarded because it was thought to be worthless. Practically it was worthless, but it was so because it was a new thing. The mill men were not used to it, and did not know how to run it. Yet the circular which was thrown out had the same intrinsic merit that have the scores of rotaries that sang in Manistee during the last sawing season. Without a doubt, there are many sawyers in that city,—and probably there is one in every mill in the Northwest,—who, had they a chance, to-day, would take their supposed worthless old circular, and make it do a hero's work. Every machine has its peculiarities,—some say its despondent and elated moods,—and no man can understand it who is not familiar with it.

There is another forcible argument we see in the use of the band saw. The white pine lumber manufacturers know, or ought to know, by this time, that the capacity of their mills has injured their business. For years the manufacture of lumber has been carried on with a mighty rush. Timber and prices have been slaughtered. Certain mill owners say that the capacity of the band mill is not large enough. If such mills are to come into general use, let the lumbermen of the Northwest hold up their hands and in unison thank heaven that their capacity is no larger. With the invasion of yellow pine from the South, and of California, Oregon and Washington territory lumber from the West, if every other circular and gang in the 2,700 mills of the Northwest were replaced by band mills there would then in coming years be all the white pine lumber manufactured that could be disposed of profitably.—*Northwestern Lumberman.*

THE DAMAGING GUM SPOT.

A widespread difference of opinion exists in the various markets in regard to the inspection of cherry. In New York there are certain dealers who consider a car load of cherry first class if it will run fifty per cent firsts on their yard inspection, while in Boston the standard is 75 per cent. firsts. In another market there is also a marked difference in the manner of grading, and the proportionate amount of firsts which must exist in order to constitute a choice or standard grade lot of cherry. This variety of opinion undoubtedly arises from one source, the prevalence of gum spots in the lumber. There are inspection rules in force which require a first in cherry to be eight inches or over in width and absolutely perfect, and it is an easy task under such a rule, of course, to pick out the firsts

It requires care and judgment in inspecting cherry to intelligently and fairly classify boards that are entirely free from knots and sap and still have more or less gum spots on their surface. As a matter of fact very few cherry boards or plank are absolutely free from gum spots; it is a natural characteristic of the timber, and while many places might have but one or two minute blemishes of this description, it naturally follows that a strict adherence to the letter of grading which consigned such pieces to a second grade, would in case the lumber had been sold in sorts, prove unjustly severe upon the manufacturer. It is true that buyers of cherry in the large markets place great stress upon the appearance of gum spots in the lumber, but observation proves that in the finest goods manufactured from this wood, the process of staining and polishing has failed to entirely obliterate the gum defects, which goes to show that while it may be desirable to secure cherry absolutely free from nature's blotches it is far from possible to do so, and consequently the feature is used more as a means of securing what amounts to a discount on the lumber when bought, than from a desire to really secure an impossibility.

Cherry growing in various sections of the country differ materially in regard to the presence of gum; a distinct choice exists between mountain growth and valley growth timber more or less cut from second growth trees i mixed in with that cut from trees of an older growth to "sweeten" the average. Still, in the face of all these facts, there should exist some common understanding regarding the classification of gum specked cherry, so that its real value may be obtained.— *Northwestern Lumberman.*

JAPANNING.

In an article on japanning, the *Scientific American* says the work to be japanned is cleansed, dried and warmed. If of wood or other porous material it is given while warm several coats of wood-filler, or whiting mixed up with a rather thin glue size, and is, when this is hardened, rubbed down smooth with pumice stone. It is then ready for the japan grounds. Wood and similar substances require a much lower degree of heat and usually a longer exposure in the oven than metals, and a higher temperature may be employed where the japan is dark than when light. The japanner's oven is usually a room or large box of sheet metal, heated by stove drums and flues, so that the temperature indicated by a thermometer or pyrometer can be readily regulated by dampers. The ovens are also provided with a chimney, a small door, and wire shelves and hooks. The ovens must be kept perfectly free from dust, smoke and moisture. A good, cheap priming varnish for work to be japanned consists of pale shellac 2 oz., pale resin 2 oz., rectified spirit 1 pint. Two or three coats of this is put on the work in a warm, dry room.

Catarrh—A New Treatment.

Perhaps the most extraordinary that success has been achieved in modern science has been attained by the Dixon treatment for Catarrh Out of 2,000 patients treated during the past six months, fully ninety per cent. have been cured of this stubborn malady. This is none the less startling when it is remembered that not five per cent. of the patients presenting themselves to the regular practitioner are benefitted, while the patent medicines and other advertised cures never record a cure at all. Starting with the claim now generally believed by the most scientific men that the disease is due to the presence of living parasites in the tissues, Mr. Dixon at once adapted his cure to their extermination; this accomplished the Catarrh is practically cured, and the permanency is unquestioned, as cures effected by him four years ago are cures still. No one else has ever attempted to cure Catarrh in this manner, and no other treatment has ever cured Catarrh. The application of the remedy is simple and can be done at home, and the present season of the year is the most favorable for a speedy and permanent cure, the majority of cases being cured at one treatment. Sufferers should correspond with Messrs. A. H. DIXON & SON, 305 King street west, Toronto, Canada, and enclose a stamp for their treatise on Catarrh.—*Montreal Star.* 1y122.

Advice to Mothers.

Are you disturbed at night and broken of your rest by a sick child suffering and crying with pain and cutting teeth? If so, send at once and get a bottle of Mrs. Winslow's Soothing Syrup for children teething. Its value is incalculable It will relieve the poor little sufferer immediately. Depend upon it, mothers, there is no mistake about it. It cures dysentery and diarrhoea, regulates the stomach and bowels, cures wind, colic, softens the gums, reduces inflammation, and gives tone and energy to the whole system Mrs. Winslow's Soothing Syrup for children teething is pleasant to the taste, and is the perscription of one of the oldest and best female nurses and physicians in the United States, and is for sale by all druggists throughout the world Price 25 cents a bottle.

Market Reports.

TORONTO.

From Our Own Correspondent.

JAN. 9.—Considerable trade has been done up to within the past five days, but as might be expected the present severe weather put a stop to all outside work, and the yards are all quiet waiting for more favorable chances. In the meantime those who are wise will stock up their yards while the present favorable prices stand, for most assuredly figures will advance ere long, and may be said to be now moving up. Stocks at the mills are run low, and the season for getting in logs must of necessity now be a short one, and with a fair prospect of the duties being taken of lumber going to the American side, all tend to make manufacturers hopeful of what the future has in store for them. On the other hand should the balance of the season prove favorable for stocking a good spurt will be put on by the mill men and a fair stock be got in, and prices may not advance to the extent hoped for. Yard men can hardly hope, however, to stock up their yards again to sell out out at the prices now being obtained. In fact they cannot now purchase to sell again at their present quotations. There is no bill stuff worth mentioning piled off on track side here. The only article that is plentiful is the lower grades of one inch boards, and as the season advances the stock in hand here will be materially lessened, and a considerable portion of that now at the mills will find its way west, so that there is but little fear of any glut during the present winter and spring. Mill men must not suppose, however, that dealers will snap up green lumber to ship out during the present winter (unless where cut to fill orders.) The question of freight on green lumber is a serious one, and dealers cannot afford to overlook that item. Railroad companies generally take care to remind them that they have such articles as weigh scales, and if manufacturers want their stocks removed before it becomes reasonably dry they will have to submit to taking low prices.

Basswood is plentiful on our market and only a limited demand for it; the same may be said of maple. Birch and cherry will find a ready market. Sawn lath are in fair demand, and shingles quiet. Should the present cold snap continue long there will not be much demand for anything below dressing and better lumber until milder weather comes in.

OTTAWA.

From Our Own Correspondent.

JAN. 9.—Not a little uneasiness exists amongst lumbermen in this vicinity over the project now said to have taken shape among Michigan mill owners of taking over logs and other lumber in crude form from the Georgian Bay and Lake Superior section for manufacture in United States territory. These Michigan men have already secured a foothold by buying timber limits in the Georgian Bay and Lake Superior section, and propose towing the logs over to their Michigan mills. While no one disputes the right of the Michigan men utilizing our forests, still it is contended that this will act detrimental to the lumber industry of this section of the Dominion, and they think that an export duty should be placed on all logs thus taken out of Canadian territory. Canadian lumbermen have to pay duty when shipping lumber to the United States, and they think it only just in the interests of the Canadian trade, that American shippers of crude lumber should come under taxation to the revenue of Canada. True it is that the United States tariff on coarse lumber has lately been reduced, still there remains the present very heavy duty on first quality. By towing logs across in booms from the Canadian side to the Michigan mills the American escape both imposts. This complaint of Canadian lumber merchants is certainly not without reason, and it is presumed that the Government will take some steps to equalize things a little in a matter of such serious importance. Another aspect of the case is the fact that the territory over which the American lumbermen will operate is that they will have easier facilities for getting their logs to the saw than the average Canadian millowner. They propose to operate in the Georgian Bay country and utilize the rivers of that territory, which will make the transport not only short but rapid. The longest distance which these logs will have to be driven before being placed in the boom, ready to be towed to the mills, will not at the outside exceed over 50 miles; whereas the Chaudiere mill owners have to drive their logs hundreds of miles before they reach the mills, and are thus heavily handicapped in the race of competition. The Georgian Bay and Lake Superior section is a heavily timbered country, and owing to the ease from which it can be reached and utilized by the American lumbermen, it offers a very inviting field for their enterprise and energy, now that their own forests are beginning to show such visible signs of depletion. Bordering on the Georgian Bay are a number of fine rivers running into the bay, which are naturally well adapted for the rapid transport of logs; whereas the Ottawa and its tributaries are not only a lengthy means of reaching the markets, but have often very hazardous channels and subject to many drawbacks owing to low water in some seasons. The question of putting all who are engaged in the lumber industry on a footing of equality is one well worthy of grave consideration, and the Government by attending to the matter at once will simply be doing a duty which is incumbent on it.

CHICAGO.

AT THE YARDS.

The *Northwestern Lumberman* of Jan. 9th says:—In the absence of anything but a dribbling winter trade, the wholesale dealers are having plenty of time to reflect on the past year, and speculate on the future. They have taken a firm grip on values for the time being, which they are able to hold, somewhat as a driver can hold a team that is standing stock still, with no disposition to go. The lumber business is taking a rest, when compared with the rush of the busy season, so that there is no trouble in holding the team of values. A little later, when the dogs of competion get a-barking, and rumors of cut prices begin to explode with much noise, the team will commence to dance and cavort, and then it will be business to hold the horses.

The books for the year have been balanced, an account of stock has been taken, the dealers know how much they have paid out, and how much they have left. It is seen that the aggregate of business done shows a decrease as compared to results in 1884. There are a few exceptions in which houses have made a comparative increase of their business during the past year. But the great majority have had an opposite experience. Dealers are now asking Why is it that receipts and distribution in and from this city fell off during the past year as compared to the year previous? Some are bold enough to assert that the Chicago lumber trade has passed the summit, and never again will be so large as it was in 1882. Other dealers take a different view, and say that another period of good times will place the white pine trade back where it was before the late depression in the matter of volume. But all regret the departure of fair profits, and the majority are fearful that they have gone to stay. As a basis for this view, it is pointed out that stumpage and manufacturing has got into strong hands, and that the cargo market fails to yield to the demands of the yard men, as it once did. It is claimed that two much has been paid per thousand for lumber now in stock. The stumpage owners and manufacturers are able to hold their values steady, while the wholesale trade is cut up and constantly menaced by competition from various quarters. Now the yellow pine of the South, and the redwood of California threatens to eat into the western trade. It is argued that under the weight of all these adverse circumstances the wholesale trade of this city must necessarily be restricted, and gradually dwindle The claim is not made, of course, that there is to be a rapid decline and near-by extinction of the wholesale trade, but it will fall off, a few millions a year, until where 1,500,000,000 was once handled by the jobbing trade, there will increase with the growth of the city and suburbs, while the near-by country demand will constantly call for supplies.

The *Lumberman*, while admitting that there is argument in the foregoing view of the prospect, must contend that the subject is not thus wholly covered. The manner of doingbusiness will change, and greater attention will be paid to local trade and special lines. There will be less dependence on rushing great quantities of lumber out West, and more of fine, economical handling introduced into the business. Still the situation of this city at the focus of lake and rail transportation, with a vast and growing local and contiguous, as well as widespread, demand to supply, must insure the continuance of a heavy distribution from this point.

But immediate prospects are really most interesting lumber dealers now. It can be plainly seen that they are anxious about the coming spring demand. Being dissatisfied with the business of the past year, they naturally want to secure a trade for the coming months that will compensate them for lost time. They look eagerly for encouragement from some quarter. The late warm weather gave them hope that the log crop would be meager. But since the later snows and freeze they have cast the short log crop reliance aside as worthless They now conclude that there will be logs and lumber enough for any demand. Now they look to a local requirement through the winter to break up assortments of dry stock as a help to prices. This is something substantial, for there will be a fair local consumption all winter, if the weather hereafter is not cooler than it has been. Moderate weather will also tend to the maintenance of a steady country trade—a condition precisely opposite to that which prevailed last winter. But the more favorable conditions on which to base a good prospect are the short stocks in country yards, and the increased demand on account of railroad building These are really the pronounced features of the situation that render the outlook now better than it was last year at a corresponding time We cannot look to a lack of supplies, beyond the fact that dry stocks will be in demand for the early trade, if it come with a rush We have no reason to think that there will be an extraordinary farmers' demand while prices for grain and meat are so low as now. But we have reason to expect that the call for dimension and strips, on railroad construction and car equipment account, will be extraordinarily large for the coming year. The call from the car factories has already begun in considerable volume. Yet the railroad demand will not be felt so forcibly early in the year as later. when construction gets under full headway, and there has been some completion.

The low state of stocks in the country yards will necessitate large buying in the spring, but it will not be so heavy in volume as would be the case if there were speculation in buying. So long as the hand to mouth method is pursued the wholesale trade will continue to complain that the country trade is slow, and profits meager. Yet, if toward spring general business and railroad construction should begin to certainly exhibit a tendency to boom, a great change would be manifest in regard to buying. Country dealers would begin to realize that dry stocks were being picked up, and that in order to transfer the profits of a sharp advance from the pockets of the wholesalers to their own, they would have to put in stock. This is what may happen, and it is well for all interested to bear it in mind.

The feeling in regard to prices at present is undoubtedly firm. Estimates on bills, wherever seen, show that list prices, or very near them, are asked for dimension. There is not trade enough, however, to be a serious test of values. Holders of lumber better than common are making inquiry about the feeling in respect to this class of stock. The strong faith in good lumber that during the past year prevailed, induced some dealers to quietly lay in ample supplies. Now these holders are naturally anxious about the future of prices. It is impossible to see why the better grades of lumber should not hold their value with the lower grades. Better times will increase the call for manufacturing, and for all purposes requiring the use of good stock.

LIVERPOOL.

The *Timber Trades Journal* of Jan. 2nd says:—The deliveries during the past week have been, as one would naturally suppose at this time of year, meager in the extreme, and the business done has had neither interest nor importance. A straggling cargo or two keep dropping into port, but nothing of importance, if we except the various lots of sundry kinds of timber arriving in the Atlantic steamers from the United States, such as oak waggon scantling, whitewood, maple and staves.

We notice in the large ship Emily Flinn, well known in the timber trade, with a cargo of spruce deals from St. John, N. B., bound to Fleetwood, has gone ashore at Sherbourne, Nova Scotia, and will probably become a total wreck. Happily, the crew has been saved, and a portion arrived here this week in the Dominion steamer Sarnia.

It is said that some shipbuilding work for the Government has been placed with Messrs. Laird Brothers of Birkenhead, and it is to be hoped the orders will be extensive, for a great amount of misery and hardship has been felt in that borough for some time past, owing to the intense and long-continued depression in the various shipbuilding and engineering concerns.

The completion of the tunnel between Birkenhead and Liverpool, which is now accomplished, will in all likelihood give a considerable increase to the building trade of the former town during the coming season, as many good building estates in Cheshire will be brought into quick and easy reach of Liverpool, and as West Cheshire is a favorite residential district with business men in this city. many of the villages will, we hope, show signs of building activity in spring and summer.

The experimental trains, under the supervision of the Government Inspector, were run through the tunnel this week from Birkenhead to James Street station, Liverpool, and the usual certificate may be expected within the next few days, preparatory to the formal opening of the line by His Royal Highness the Prince of Wales on the 19th of this month.

LONDON.

The *Timber Trades Journal* of Jan. 2nd says:—There is but little fresh to chronicle as to the course of business for this season's shipment, but we expect that before the end of this month some considerable contracts will be closed on this side. With regard to France, many good judges are of opinion that the importers there will not hold aloof from the market during the early part of the year, as they did last season, but will, at any rate, provide for part of their requirements before the shippers' specifications are too much picked over. Altogether, the situation seems a more hopeful one, and, as sellers seem inclined to be reasonable, and buyers not unwilling to operate if fairly met, we shall be surprised if we are not shortly in a position to inform our readers that some extensive operations have taken place. We expect, however, that the coast buyers will lead the way, and we do not anticipate that the London importers will purchase much on

f.o.b. terms, until they are in a position to judge as to the course the market is taking. We expect, of course, a few special makes, which always command a ready sale.

The dock deliveries, we are glad to be able to say, have shown some slight improvement on last year's report to date. The increase over the corresponding week twelve months since, amounts to 463 stds. deals, battens, etc., and 112 standards of flooring, but the item of floated timber is some 400 loads short. We have become so accustomed to be always bewailing the diminished consumption, that it comes as quite a relief to be able to change our tone, and we hope the altered state of things will continue. Next week we shall be comparing 1886 and 1885, but we must not forget to have an occasional look back at our old friend 1884. It is a good augury beginning the new year with fresh activity in the dock deliveries, and for Christmas week, too, the improvement reported is of additional importance, for that is generally credited with being the dullest week in the whole of the year in the wood trade.

One effect of the continued pressing of goods on the market has been to give to the timber trade a more retail character than it formerly had, and the small dock orders which are exchanged now would have had a startling effect on the merchants of thirty years ago. Exceptional cases will occur when it is difficult to help giving an order on the docks to deliver to somebody or another half a dozen deals or as many boards, or even a few bundles of laths; but a decade since such instances were very rare. At the present time, however, they have almost ceased to create surprise, though by no means welcome to the officials who have to execute them. What will be the outcome of all this retail business time alone can tell. Perhaps when prices take a turn for the better the desire to hold bigger stocks will work its own cure, and sellers will feel less anxiety to press goods in such little parcels.

We are glad to note the improvement in the dock deliveries the past week, Christmas week too, when things might be supposed to be at their worst; the record shows something like five hundred standards of deals over and above last year's consumption during the same period.

The satisfactory settling on the Stock Exchange and the absence of failures in the outside market are favorable features of the new year. Altogether the outlook is quite up to earlier anticipations. The activity in the dock deliveries is also significant of trade improvement. Things could not go on being dull for ever, and we hope the turning point is now reached.

TYNE.

The *Timber Trades Journal* of Jan. 2nd says:—The Christmas holidays have effectually stood in the way of any business having been done during the last seven days, and in this district the New Year's Day being even a more popular holiday than Christmas, they extend from 24th of December to January 4th, most works being entirely closed during the whole of that period, and in consequence business is at an entire standstill. At present there is not a great deal of business to be done, and to owners of saw mills, or any mills where much machinery is employed, the relief is satisfactory when a slackness of orders is felt.

The importations are, as may be expected, on a very small scale. They cover, however, two complete steamer cargoes of wood goods, one from Namsos of battens, and one from Drontheim of staves, one late ship from Stockholm with deals and battens, and several items of lesser importance.

So far no business is reported over this district for next year, and in the face of large stocks and a small demand it is scarcely likely to be attempted for some time to come.

Queer Books in a German Library.

One of the most curiously original collections of books in any library is said to be a bontanical collection at Warsenstein, in Germany. At first sight the volumes appear like rough blocks of wood; but on closer examination it is found that each is a complete history of the particular tree which it represents. At the back of the tree the bark has been removed from a space large enough to admit the scientific and the common name of the tree as a title. One side is formed from the split wood of the tree, showing its grain and natural fracture; the other shows the wood when worked smooth and varnished. One end shows the grain as left by the saw, and the other the finely polished wood. On opening the book one finds the fruits, seeds, leaves, and other products of the tree, the moss which usually grows upon its trunk, and the insects which feed upon the various parts of the tree. To all this is added a well printed description of the habits, usual location and manner of growth of the tree.—*London Daily News.*

The Season for Complaints.

This is the season for complaints, to witness the number of questions that are coming forward, and we never recollect a year in which claims have been so rife as in the one now drawing to a close. It would be interesting to have a formal report of all the arbitration cases of which the trade as a body know nothing that have been settled this year. The surveyors, who now form an important branch of the wood trade, have we expect, had rather a busy time of it.—*Timber Trades Journal.*

SPRUCE.

An exchange says:—The supply of spruce is very limited as compared with that of pine. Outside of New England, Province of Quebec and the Adirondack region there is little or no spruce of Commercial value. Spruce lumber, taking into consideration its strength, lightness and desirability for framing purposes, is selling comparatively lower than any other valuable wood on this continent. Simply because spruce has always been in overstock in New England the price has been unreasonably depressed. The necessities of small millowners has ever created a supply slightly in excess of the demand and a consequent weakness in prices. If a single reason of short supply should occur, so that that the buyers were forced to seek supplies of the manufacturer, prices would be considerably and permanently advanced. It is a sin to slaughter our magnificent spruce forests with so little remuneration to either operators, manufacturers or dealers. We predict within ten years good sized spruce lumber will sell at double the price of sapling pine. Spruce lumber will meet with proper appreciation when an approaching scarcity, at least in large sizes, forces builders to hunt for desirable substitutes, so light, so strong, and so easily worked. Already the lumbermen report the berths of virgin spruce as growing scarcer and farther removed from drivable streams and transportation by rail.

DROWNED IN LAKE NIPISSING.

OTTAWA, Jan. 13.—Mr. Charles Sereny left this city last Wednesday to visit his lumber works on Lake Nipissing. Some time after reaching the shanty, near Nipissing Village, he complained of feeling unwell, and a letter was sent to Southeast Bay, summoning Dr. Walton to attend him. On reaching the shanty, in which Mr. Sereney was confined, the doctor found the man suffering from insomonia or sleeplessness, and injected morphine into his feet to induce sleep. On Saturday night the foreman of the shanty, Mr. McDonald, heard a noise but paid no further attention to the matter. On rising in the morning McDonald discovered that Mr. Sereny was not there and went to look after him, but no traces could be found for some time. Finally traces of footsteps were found near the shanty in the vicinity of Nipissing village. The tracks were compared with feetware belonging to Mr. Sereny and it was found that the feetware and tracks fitted. The tracks led to a portion of the lake where the water is open, but no returning tracks were found. At the point where the track stops the water is very deep No trace of the body has yet been found, but no one has any doubt but that Mr. Sereny wandered to this spot in his delirium and was drowned. The body has not yet been recovered.

Bark Up and Bark Down.

When it is desired that the bark shall come off of wood easily, it should be piled bark down. A correspodent writes giving his experience as follows:—"I have sold wood for over forty years, and I find that when wood is corded bark up, the bark remains on until I sell and measure up the wood, and all that is bark down, the bark falls off, and measures nothing. Besides, there is more heat in the sap of the log. The most and best ashes are also in the bark. I have on my place now some wood that was chopped nine years ago, and corded bark up, and the bark would hold on if I would draw the wood eighteen miles and cord up and measure; besides, where the bark is piled down, the water runs in around the wood and makes it dozy, wet and heavy."—*Ex,*

Advice to Mothers.

Are you disturbed at night and broken of your rest by a sick child suffering and crying with pain and cutting teeth? If so, send at once and get a bottle of Mrs. Winslow's Soothing Syrup for children teething. Its value is incalculable. It will relieve the poor little sufferer immediately. Depend upon it, mothers, there is no mistake about it. It cures dysentery and diarrhoea regulates the stomach and bowels, cures wind, colic, softens the gums, reduces inflammation and gives tone and energy to the whole system. Mrs. Winslow's Soothing Syrup for children teething is pleasant to the taste, and is the prescription of one of the oldest and best female nurses and physicians in the United States, and is for sale by all druggists throughout the world. Price 25 cents a bottle.

BEAR SLAIN WITH DYNAMITE.

I remember once when I was mining near Breckenridge that I met a grizzly bear, one that would tip the beam at 1,000 easily. You see, I was going up to the mine, and nothing could be further from my mind than expecting to meet one of those fellows at such a time and place. But it's like them, they always turn up when they are least expected, and when you are most ill prepared for them. I had no gun with me, or even knife. What was worse, or would be to a man who lacked presence of mind, I had with me a box containing dynamite cartridges, which were to be used in the mine. This would of itself have prevented me from retreating with credit or despatch, if such a thing were possible; but it so happened that when I sighted the bear I had wandered from the regular trail, having taken a narrow ledge in the hope of finding a short cut to the mine. There was a sheer fall from this of at least five hundred feet. The bear had already passed on to this when I first saw him, and as I never before traversed the ledge, I had no idea as to how far it might be passable.

When I saw the bear it was evident that he had not yet discovered my presence. He was snuffling along at an easy gait, apparently quite familiar with the path. I did not dare to run on the narrow ledge, but I got in the best licks at walking that I knew how, and had soon gained a fair lead on the grizzly. I began to hope that I would come safely out of the difficulty, and was further encouraged by the fact that the ledge appeared to be slightly wider as I advanced. In rounding a sharp curve, however, you may imagine my consternation when I saw the ledge suddenly terminate not twenty feet in front of me in a cavern, unquestionably the habitation of the bear. Above the wall rose straight hundreds of feet, and below there was empty space. The bear had made a nice selection of a home, I saw at a glance, and he would find here, right at his very door, a meal in me, provided I could do nothing to avert the catastrophe.

My mind became strangely active. The events of my past life did not pass in review before me. It might have been on account of lack of space, but it is much more likely that it was due to the greater interest attaching to the incident in which I was soon to take a prominent part.

I tried hard to think of some way out of the dilemma, and came so near finding nothing to base any hope on that I almost lost my presence of mind. I did not, however. I thought of everything I had about me, with a view of using it for my defence. I had eight pounds of candles, a jack-knife, and a lead pencil. It occurred to me that if I had sufficient candles I might feed the bear for a while until I could induce him to feel that he was in a condition for hybernating, but I would not be more than able to whet his appetite with what I had. The jack-knife and the lead pencil were dismissed without a moment's thought. The dynamite suggested possibilities. I hit upon a plan. Taking a dozen sticks of dynamite, I thrust them in among the candles, and hastily retracing my steps around the corner I placed the charge of candles and dynamite in the path of the approaching bear The latter was but a few rods away, but appeared to be wrapped in such a brown study that he did not notice my action. Then I again retreated around the curve, and withdrew myself into the bear's cavern to await developments. I did not have long to wait. In less than five seconds after I entered the cave the mountain shook as though in an earthquake, and I knew that I had succeeded. The bear had evidently tried to eat the candles and found them too much for him I rushed out to see the result of my strategy. There was little to be seen, however. A tuft of hair here, and a splash of bear's grease there, a splinter of bone or two, and the end of the bear could only be guessed.—*Denver News.*

Heavy Losses to Cattle Men.

DODGE CITY, Kas., Jan. 12.—The heavy snow and the bitter north winds of the past two days have caused the most serious apprehensions among cattle men as to their probable losses. Within a few miles of here 500 head have drifted to the river, where they perished in attempting to cross, or drifted up to the fences, where they remained frozen to death. A man from a ranche south reports seeing cattle on his way up frozen that were standing on their feet. The water holes are frozen over. The grass is snowed under, and the weather is cold, with every prospect of more snow. The loss of live stock will be very heavy on the Arkansas River.

During last year 3,364,205 dozen of eggs were imported into the United States from Canada through the Suspension bridge customs office alone. The trade is assuming immense proportions

FOR HE

Canada Lumberman

IT WILL PAY YOU, BECAUSE :

1. It is the only newspaper published in the Dominion of Canada devoted to the lumber and timber industries.
2. It is devoted to the development and utilization of our forest wealth.
3. It furnishes complete and reliable quotations of prices of lumber in all the leading markets.
4. Its columns are filled with interesting reading matter, valuable alike to the land owner, manufacturer or dealer.
5. It costs only $2.00 per year to have it sent, post-paid, to any address in Canada, and no land owner, lumber dealer, manufacturer or individual in any way connected with timber industries, can afford to do without it.

☞TO ADVERTISERS.

It has a circulation among saw mill owners, manufacturers, lumber and timber dealers and all classes connected with the timber business.

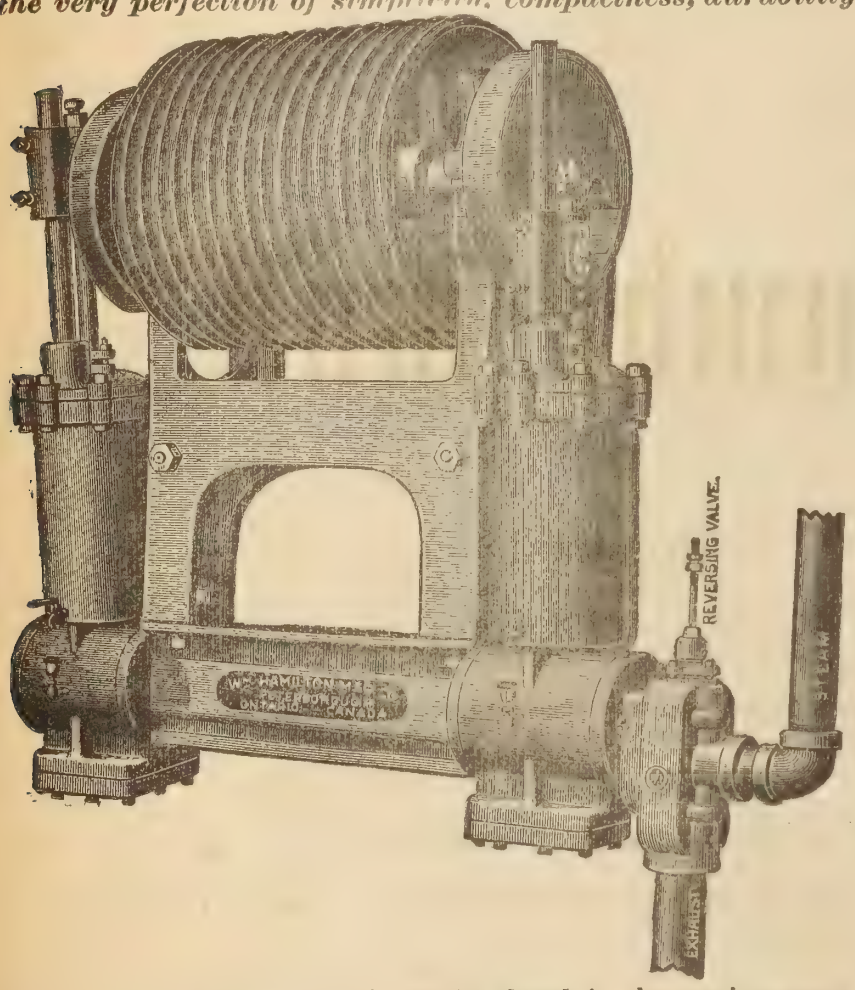
Examine the field, count the cost, and you will at ? .e decide that the CANADA LUMBERMAN is the

———CHEAPEST, BEST, MOST RELIABLE and ONLY TRUE MEDIUM———

for placing your goods or wares before the saw-mill men and lumber and timber dealers of the Dominion.

CUNNINGHAM'S
PATENT OSCILLATING TWIN ENGINE
FOR STAM FED IN CIRCULAR MILLS WITH RACK OR ROPE.

This Engine has practically but two moving parts, aside from cranks and shafts. The whole array of eccentrics, valves, valve rods, connecting rods, cross heads, slides, levers, rock shafts, bell cranks, etc., is done away with, and the very perfection of simplicity, compactness, durability and cheapness attained.



The above engraving illustrates the Twin Engine, 10x16, for Rope Feed, for Saw Mill Carriages. The spool is 27 in. diameter, 30 in. face, is grooved 2 in. pitch for 1½ in. rope. The shaft is steel, 4½ in. diameter, with disk cranks. No connecting rods, eccentrics or valve rods to get loose and out of order. The ports are in the trunions, and worked by an oscilliation of the cylinders, and are held in their place in the downward motion by a steam cushion below. The sawyer's valve is a perfect balance, and by moving this valve the engine can be reversed, stopped or started almost instantaneously if necessary, as the sawyer has perfect control of it by his lever either to go fast or slow. Should the sawyer let go of his lever either by mistake or any other cause, it is balanced so that the valve will come to the centre and cut the steam off both cylinders and stop the feed. When standing, the lever is locked or fastended, so that is is impossible for it to start off itself. The engine stands upright below the carriage, and bolted to two upright beams, placed on the mill for the purpose. When a rack is preferred in place of the rope, we put on a steel wheel 30 in. in diameter, and the engine placed high enough to work into the rack on carriage bar, or if the beams come in the way, an idler wheel can be used between engine and rack segs; or, the engine can be placed at a distance and have a shaft from it to the carriage; or it can be placed in the engine room, where it is under the control of the engineer for oiling, thence by shaft and pinion to carriage rack bars. These engines are well adapted for cutting long logs, or where the logs are mixed, the advantage of this feed will be apparent to mill men. When the carriages are used in two or more sections, the coupling and uncoup ling of each section is quick and simple.

There were two of these feeds working this summer and giving the best of satisfaction, one with rope feed at James Playfair & Co's Mill, Sturgeon Bay, near Waubaushene, and one at the new mill furnished by us to Francis Carswell & Co., at Calabogie Lake, on the Kingston and Pembroke R. R. This mill is working with the Rack and Pinion feed, and drops from fifteen to seventeen stock boards per minute. We have also sent one to the Rathbun Company, Deseronto, to put in to feed their heavy Circular Mills. They will also commend themselves for various other cases, especially for running Elevators, hoisting Engines, and wherever a simple and easily reversible motion is required.

We would also call attention to our Improved Hand Saw-Mill for cutting logs

☞ ***We guarantee this to be the best Mill of its kind got up, and would ask any one wanting a good Band Saw-Mill to communicate with us. We would also call the attention of Mill Men to our new IRON GANGS, CIRCULAR MILLS and MILL MACHINERY. For further information, prices, &c., address the Manufacturers,***

VOL. 6. PETERBOROUGH, ONT., FEBRUARY 1, 1886. NO. 3.

NEW YORK CITY.

The *Record and Guide* in its annual review of the lumber trade for the year 1885 says:—

The general lumber trade of this city has been conducted in a quiet, undemonstrative manner during the past year, and at no time did business develop into quick, snappish form. To a portion of the operators this absence of flurry and excitement has been a source of annoyance and complaint, as their ideas of trading are confined in the main to large sweeping sales and constant fluctuations on value as influenced by a speculative sentiment rather than by natural factors. Happily, however, with no chance to work the market, that class of trader has gradually disappeared, and the reports from the more conservative portion and majority of those engaged in handling the various kinds of lumber are by no means as uncheerful as might have been expected. Rates have certainly been low and margins narrow throughout, and that very feature was unquestionably a strong attraction and material aid in drawing out and preserving a good consumptive demand. So that by careful nursing all good intentions of buyers in listening to and accepting fair bids, and refusing to take advantage of evident and only momentary necessities of customers, dealers have made a great many sales of all sized invoices that will probably fully equal in the aggregate that of 1884, and it is a question if there is not really an excess. The only comparative record that can be reached, is that of the export trade; and here we find an increase over the preceding year, notwithstanding constant and positive assertions during the season that the foreign trade was running behind. These claims, however, were due in a measure to the "cutting up" of the export business among a larger number of dealers, and the additional opportunities offorded shippers by offerings direct from interior points; and those who were most hurt by the change seemed to think that business was losing ground. A change in method should also be allowed for in calculating upon the volume of local consumption, as a great many small dealers as well as manufacturers and contractors have been added to those who purchase direct from the producers or pretty closely thereto; and this supply is rarely taken into consideration when the exhaustive capacity of our market is in question. No means are available permitting even a fair guess as to the proportions of leading grades of lumber used in comparison with former years; but as a simple matter of surmise, hardwoods have probably made a gain. Values have touched no lower points than in the preceding year, except in two or three instances; but were also without recovery on losses of 1884, and this has made a modification in the average of cost on first hand parcels of which consumers have reaped a fair share. For yard rates, however, it has been a difficult matter to give other than a nominal line of quotations, and make the range pretty wide at that; as the "go as you please" manner in which dealers conduct the business gives nearly every concern, great or small, some different notion of valuation, based on inspection, delivery, quantity, terms of credit and other minor influences on which there is an entire absence of uniform action. Failures have come to disturb a portion of the trade, but disasters have not been heavy or widespread, and the collections and settlements naturally due at about this period are progressing very well. The amount of stock on hand at the turn of the year is doubtful, owing to the uneven character of the accumulation. Some of the principal and generally far-sighted dealers seem to have simply taken about all the stock they could by any possible means find room for, partly on account of its comparative cheapness and partly in expectation of a coming good demand; while others fully with as much ability to purchase, and standing high in the matter of clear judgment, are carrying a smaller supply than usual—not because they consider the cost, but rather that they are uncertain and far from sanguine regarding the future. Taking fine and coarse together, however, we think there is a little more stuff in yard than a year ago, but less to fall back upon at near primary poins, such as Albany, etc.; and since the winter tariffs went into effect few, if any, rail offerings except at advanced figures. Without the development of any unexpected disturbing element the chances for spring trade are good in this city, and excellent in Brooklyn, and upon its own natural merits the market, as a whole, is no doubt in better form than one year ago.

WHITE PINES FOR LUMBER.

We have frequently referred to the desirability of appropriating many of the waste spots in the farming districts of New England and New York to the growth of white pine for lumber. No better disposition could be made of such spots. A correspondent of the Woonsocket *Patroit*, taking a similar view of this subject, supposes in a practical way that we take a good standard growth of pines, say 150 trees to an acre, averaging at the end of forty years 250 feet each, board measure, making in round numbers about 40,000 feet, thus averageing 1,000 feet of lumber for each acre each year and on the poorest land of the farm. The poorest land, he says, can be bought for $6 an acre, which is, perhaps, a high price in some sections, but taken as a basis the interest and taxes of each acre would be about 32 cents per year; cost of ploughing, harrowing and sowing the seed about $5 per acre; cost of three quarts of pine seed about; interest on this investment 28 cents per year for each acre, making 60 cents per year above first cost for each acre, with the exception of the rise of the taxes as the value of the land increased, and if this be sent at an average of 15 cents more for each acre, we shall then have the extra cost for each year of each acre at 75 cents. So the thousand feet of lumber cost 75 cents on the stump, or, putting in the risk of fire at 10 cents and all other losses and liabilities at 15 cents, the total cost will then be $1 per acre of 1,000 feet of pine lumber on the stump. But such price lumber in this section is worth $4.50 per 1,000 feet on the stump, so that the grower may estimate a profit of $3.50 for each acre each year above the income of four per cent on his investment. The acre on this basis gives an income each year of 29 per cent on the first investment. Even if the croaker is allowed to call this a trick of figures, it certainly contains sufficient suggestion to stimulate much thought upon the subject of growing pines on waste lands.

Ordinary human nature does not like to look ahead forty years, but in the nature of things those kinds of business which are new and peculiar, and in which the few venture, are generally apt to yield larger income.

About the seed. The cones of pine are not produced every year, and the grower must watch his chance and may have to climb the trees after the cones, for they must be gathered just before they open. Then spread them on a tight floor or old sail cloth until fairly dry, when they will open and a sharp rap will jar out the seed. If the trees come up too thick it would be well to thin them out, and, perhaps, to transplant a few on the vacant places or even on a new piece of land, though transplanting is a delicate piece of business. In eastern Massachusetts and Rhode Island most of the pine lumber is used for boxes and is usually sawed thin, from five-eights of an inch to seven-eights of an inch thick, rough-edged, and is bringing now at the box mill from $9 to $11 per 1,000 feet, costing from $2 to $2.50 per 1,000 feet for the saw bill. Many are the acres of wretched bush pasture and stretches of sand flats, and even scrub oak lands, where a growth of pine might be started up, using a little labor and common sense.—*Manufacturer's Gazette.*

AVERAGE ADJUSTMENT ON RAFTED TIMBER.

The subjoined letter recently appeared in *Lloyd's Shipping Gazette*:—

"SIR,—We beg to call the attention of your readers to the following facts. While a vessel was loading a cargo of pitch pine timber from rafts in a port of the Southern States of America, bad weather came on, and a quantity of the timber, which had been secured along side, broke adrift. Part of this was subsequently recoved by the captain; at a cost to him of about £40, and the remainder was lost. More timber was sent alongside the vessel, and she was filled up and came on to her destination with a full cargo. It is the universal custom at all North American timber ports, when vessels lose timber from alongside while loading, and it cannot be recovered, to supply them with more timber to fill up with, so that whether the timber lost from alongside be recovered or not the vessel has always a sufficient supply of cargo to complete loading, and thus a full freight is earned. The shipowner, as far as his freight is concerned, has, therefore, no interest whatever in recovering the lost timber, and under these circumstances the timber is recovered for, and only for, the benefit of owners of cargo or underwriters thereon. Hitherto both merchants and underwriters on cargo have accepted this mode of adjustment, but we have now before us the following opinion of a leading firm of London average adjusters: 'We are of opinion that the freight on the cargo so salved, after having broken adrift from the ship, should contribute to the said expenses of salvage.' We cannot but think that the view taken by these gentlemen is wrong, and wish to point out that the effect of that opinion, if brought into practice, would be to make owners of ships, or underwriters on freight, liable for a proportion of expenses incurred solely for the benefit of the cargo, and it would, on becoming better known, further have the effect of discouraging the recovery of timber lost from alongside; for, as we have clearly shown, though timber is lost, the vessel still gets a full cargo, and, consequently, loses no freight; but if the captain incurs expense in recovering timber, then according to the average adjuster's opinion just quoted, he or his owners must claim on the underwriters on freight for a portion of same; or, if the freight be not insured, then bear the loss themselves. The captain will not, under these circumstances, take any further trouble with timber that has gone adrift. In that case the underwriters on cargo would become the ufferers.

Yours, &c.,

ALFRED DOBELL & Co.

Whitewood.

So far as Great Britain is concerned the demand for whitewood is principally, if not entirely, from Scotland, as buyers at the north-east ports profess themselves unable to pay the figures which can be obtained without difficulty from Scotch importers. The English firms, however, are quite willing to contract at a moderate advance on last year's rates, and they will doubtless augment their offers still further as soon as they become convinced that the reports received from the Scotch and German markets are reliable. We have already prepared our readers for an improvement in the prices of whitewood battens, and, so far, our prognostications have been realized, as an advance of fully 5s. per standard has been established without difficulty. We expect to find whitewood retain its firm tone throughout the season. —*Timber Trades Journal.*

MONTREAL LUMBER TRADE.

MESSRS. Henderson, McKenzie & Co., shid brokers, of Montreal, have favored the CANADA LUMBERMAN with an interesting statement showing the shipments of lumber made from Montreal during the past season. The details are minute, but the statement is so interesting to the trade that we give it in full.

TO THE UNITED KINGDOM.

The following is a statement of the deal and lumber shipments from the port of Montreal during the season of 1885:

Quebec Standards		3,260,633,15

The monthly shipments were as follows:—

May	284,981.13
June	489,469 30
July	602,941. 9
August	756,776.23
September	383,935 48
October	457,938.48
November	284,590. 9

A total of 3,260,633 15 Quebec standards, or 89,667,407 feet. The total forwarded by steam was 3,064,809.27 stds. and by sail 195,823.43 stds.

The deal shipments to the United Kingdom were made by the following firms:—

	Quebec Stds.
R. R. Dobell & Co	1,402,959.00
John Burstall & Co	715.321.00
Bryant, Powis & Bryant	596,226. 1
Robt. Cox & Co	417,134.25
Other small shipments	158,526.40
Total	3,404,453. 6

The following is a statement of the shipments from Montreal to the United Kingdom during the years mentioned:—

1880	19,784;885 ft.
1881	15 539,287 "
1882	50,514,378 "
1883	50 514,378 "
1884	52,587,205 "

Oct. 28	Alice Roy	520,000
Total		4,946,000

Equal to 179,854.30-55 Quebec standards.

The quantity of pine shipped was 26,519,543 feet; spruce, 4,825,000 feet; total, 31,344.543. Spars, 688, small towage, 526,828 pieces.

A shipment of 402,599 feet was made on the Aspotogan for the west coast of South America.

The following is a recapitulation:—

	Feet.
From Montreal	26 868,142
" Lower St. Lawrence	4,879,000
Total	31,747.142

For the years mentioned the shipments were:—

	Feet.
1880	10,420,080
1881	16,147.941
1882	24,419,827
1883	18.768,652
1884	37.355,553
1885	31,747,142

RECAPITULATION.

The total shipments from Montreal Harbor and Pierreville to the United Kingdom, and from Montreal and lower St Lawrence ports to the River Platte, west coast and Australia were:—

	Quebec Stds.
By steam to United Kingdom	3 208 629 28
Sail do. do.	181 770.43
" River Platte	1 139 801.31
" West Coast S. A	14,639 53
" Australia	14 053 00
Total	4,558,894.45

or 125,269,613 feet board measure.

PHOSPHATES.

The total shipments of phosphates from Montreal have been as follows:—

	Tons.
1880	7,500
1881	10 307
1882	15 556
1883	17 160
1884	20 461
1885	24,876

In this climate it is of the greatest importance that a Cough should be cured immediately, as delay is liable to bring on Pulmonic Complaints that will take considerable time and money to cure. Always be prepared and have a bottle of West's Cough Syrup on hand, the remedy that was never known to fail. Cures Bronchitis Asthma, Hoarseness and all Throat and Lung diseases. Sold by J. D. Tully, druggist. Price 25 cents, 50 cents, and $1 per bottle.

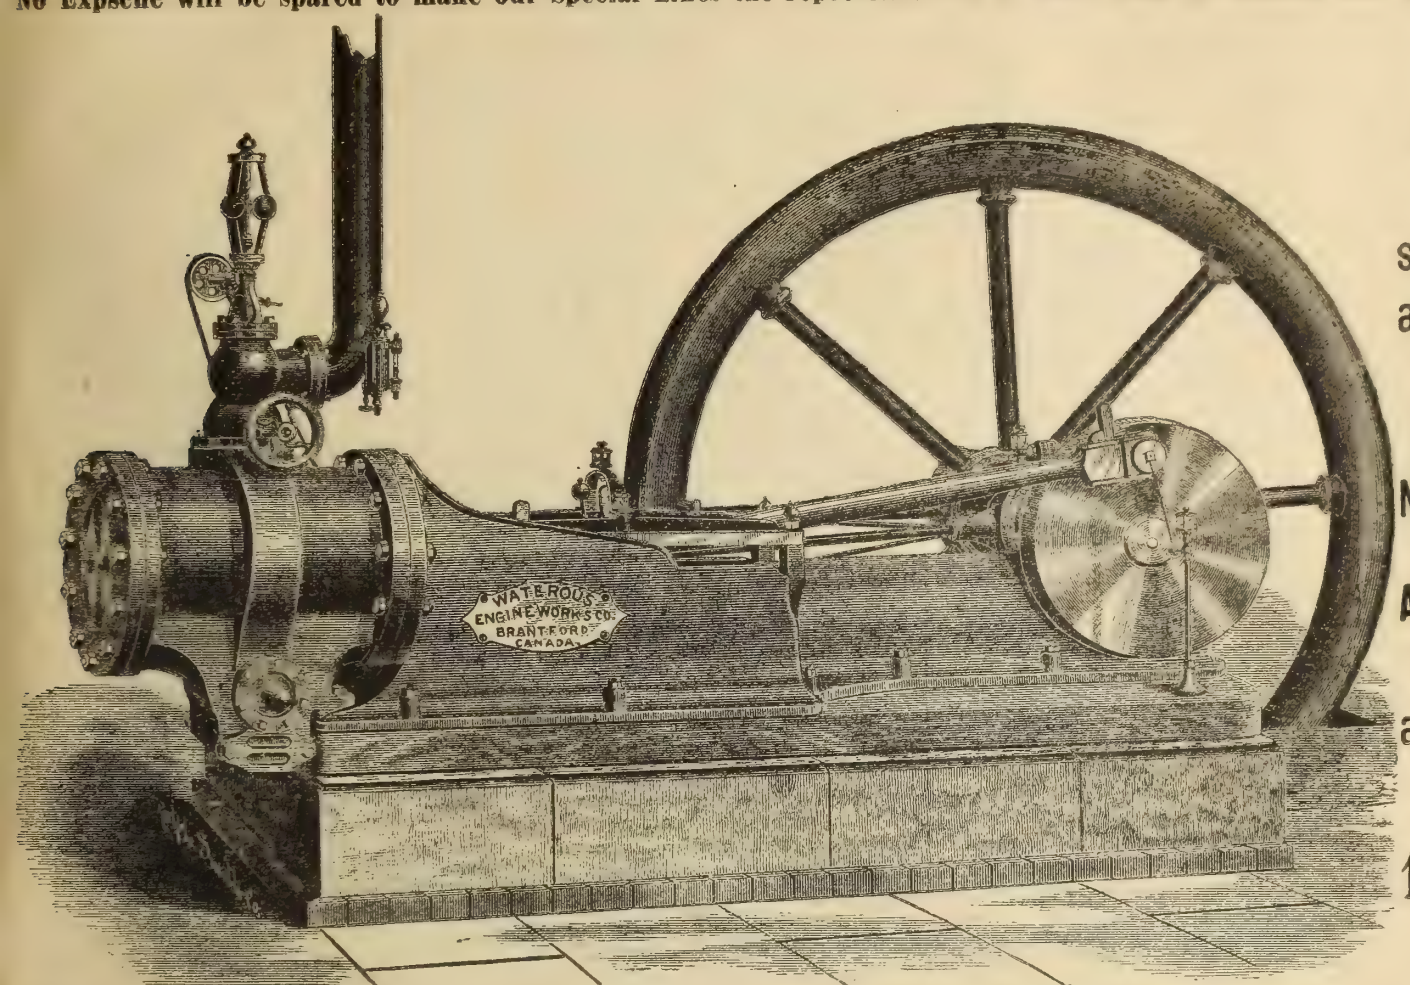
J. D. Tully, druggist, will gladly inform any one inquiring of him of the wonderful results of West's Cough Syrup. It is an unfailing cure for all throat and lung diseases, coughs, colds, hoarseness, influenza, consumption in its early stages, and whooping cough. Price 25c., 50c. and $1 per bottle

SHILOH'S COUGH and Consumption Cure is sold by us on a guarantee. It cures consumption. For sale by Ormond & Walsh, druggist Peterborough.

Heavy Substantial Saw Frames, Carriages and Engines

BEST MATERIAL AND WORKMANSHIP.

No Expsene will be spared to make our Special Lines the representatives of their class in Canada, and the best that can be made.



Send for New Illustrated Catalogue No. 14, devoted specially to Saw-Mills and Saw-Mill Machinery Box Board Machine, Veneer Machine, New Shingle Machine,

AUGERS.

"Like many of our most useful inventions," said a prominent auger maker recently, "the principle of the auger now in use all over the world was discovered by accident. In 1680 Benjamin Paugh, an Englishman, while watching some school boys endeavoring to bore a hole in the ground with a piece of iron barrel hoop, noticed that after the hole had been sunken some distance into the earth and the flexible metal of their improvised boring tool had become heated, it twisted and carried the dirt up to the sureace nicely, and he could not see why the same principle should not apply to wood. The invention of the auger was the result. The screw auger," he continued, "is an American invention, and was invented about 100 years ago by Thomas Garret, who lived in the vicinity of Oxford, in Chester County, this State, where most of the black augers are still made.

"Most of the bright tools are made down east, but one of the principal manufactories is in this city. The old-fashioned pod auger is still used in Germany and England.

"The single screw auger is also an American invention, and was first discovered by accident by a Philadelphian. It is the only auger that can be used to any satisfaction in very hard woods, where the double-screw augers become clogged."

Although every one is perfectly familiar with this common-place tool, but comparatively few know the process of its manufacture. In making augers the iron which form the main or spiral part is welded into the steel of which the tip is made before forging. The bar is then put under hammers and forged into shape. It is then put into what is called a wringing machine and twisted up in a rough state into the spiral form, after which it is passed through crimpers, giving a uniformity of twist. The augers are next put through straightners and revolved, making them perfectly straight, when they are ready for putting on the head, which is the most delicate operation in their manufacture and requires the work of a skilled artizan. They are then subjected to a grinding out process, which consists of putting them through two rubber wheels to rough polish the twist.

The fitter-up then takes hold of them and lightens or fits the head; then the filers file down and sharpen the heads, after which they pass through the hands of the polishers, where they are polished and hardened ready for market.—*Ex.*

THE NEW YEAR AND THE OLD.

From a business standpoint the year which has just ended was notable principally as a period of recovery. Since January, 1885, values have been slowly rising. In many instances the progress made appears but slight, and still nearly everywhere along the line the advance is sufficiently marked to be obvious to the most superficial observer, and in some industries the improvement is very noticeable. At the present moment it is safe to say that the outlook is decidedly encouraging. All the conditions essential for a prosperous year are now at hand. It is true that the silver coinage question is still unsettled, but with this single exception the commercial and financial conditions now ruling are thoroughly satisfactory.

The improvement in the iron trade, regarded in business circles as an especially encouraging sign, has been followed by equally favorable changes in most of the other leading industries. The stock market is particularly active, and as regards the lumber trade the reports from every important centre of this industry are very satisfactory. In Maine the season closes with stocks well sold out at the mills, and every indication of a greatly increased demand with the opening of spring. In the Middle States the situation is on the whole quite as encouraging. In the South we find the mill-men, as a rule, fairly satisfied with the business of 1885, and confident of still better fortune in the present year. To those who are acquainted with the resources of the Southern States this confidence seems perfectly justifiable. From the great lumber regions of the Northwest, where the trade has been most depressed, the advices are all highly encouraging. A year ago the manufacturers were complaining that the increased production had not been followed by a demand to correspond, and that stocks of lumber were accumulating to an alarming extent. But during 1885 the production of lumber was greatly curtailed, while the demand through the year was much larger than was anticipated. The result has been a large reduction in the stock now at hand as compared with that available a year ago. This combined with the certainty of a heavy demand in the spring and the favorable business conditions generally prevailing, has infused a hopeful feeling through all branches of the lumber industry of the Northwest.

There is in these circumstances nothing to warrant any extravagant anticipations as regards the business of 1886, but judging from present appearances, noting the abundance of money, the firmness in the stock market, the rising tendency in the prices of raw materials and manufactured goods and the increasing demand for labor, it seems certain that 1886 will be, as regards the volume of business transacted and prices obtained, a great improvement on the year which has just expired.—*Saw Mill Gazette.*

FORCE, POWER, AND WORK.

There exists in the minds of very many engineers with whom we come in contact but a very vague conception of the meaning attached to these three little words. Not so much does the difficulty appear to be in getting at a general sense of meaning for the words, as to separate the general idea conveyed into its factors, and to discern clearly just what portion of this whole is meant by force, by power, and by work. Let us therefore consider each in their order, and study their composition and relation.

We all have a pretty good idea of what force is, but the difficulty appears to be to disconnect the idea of force with that of motion. We can easily appreciate the force of gravity when we see a weight falling to the earth, but it is more difficult to comprehend the force as still existing, after the body has reached the ground, tending ever to draw it nearer the earth's centre whenever its support shall be taken from under it. Force is exerted by the magnet as much in holding a nail against its pole as in moving it up there. When the nail was in motion, or the body was falling to the earth, there was power developed. Power is the product of force and space. If a magnet could lift a weight of one pound against the force of gravity through one foot, it would develop one foot pound of power. If the force of a cylinder full of steam can push a piston against 110 pounds through three feet, it will develop 330 foot pounds of power.

Now what is the difference between power and work. Work takes account of the time in which power is exerted. If the engine mentioned was 48 inches in stroke it would have to make one revolution to move the load through three feet as above. Now suppose the engine to run 100 revolutions per minute we should have 110 pounds move through 300 feet in a minute, which would equal one horse power of work. If the engine runs at 50 revolutions per minute we should have only 150 feet per minute =16,500 foot pounds per minute=one-half a horse power, and if it runs 200 revolutions per minute it would develop 66,000 foot pounds per minute=two horse power of work. Work is the consumption of power and the horse power, the measure of work is the measure of the rate of its consumption of power. It is evident, therefore, that a machine, the resistance which it requires a certain force to overcome, its resistance twice the number of times in a given time, and that it is not the pounds of force which a machine is capable of exerting which qualify its consumption of power unless we take into account the distance through which this force is exerted. For instance, a test of the power required by a certain shop was unsatisfactory to the man who owned the engine. He maintained that certain embossing presses consumed almost as much power in themselves as our instruments showed for the whole shop, and called our attention to the irresistible force with which the dies were pressed into their work. The press was a heavy one with a large fly wheel and a toggle joint with an enormous leverage. It was run at a moderate rate of speed and a man with a crank upon the fly wheel could easily have run the press at its usual rate and have exerted that enormous pressure upon the dies as many times a minute as when it was run by power. The force exerted was truly great, and would have measured a good many pounds, but the distance through which it was exerted, the depth of the impressions was a very small fraction of an inch smaller still of a foot, and when reduced to foot pounds of power amounted to but little, and this number of foot pounds was not repeated a sufficient number of times per minute to amount to much when reduced to horse power of work. It is surprising to see how much power is required by a small engine running at a high rate of speed. We have seen an emery wheel without work being ground upon it absorb a full one-third of the power required by a good-sized machine shop, while the variation in the load afforded by stopping and starting a large planer was comparatively slight.—*Boston Journal of Commerce.*

RAISING OAK TREES.

During the last few years large quantities of acorns have been taken from this country for the purpose of planting. White oak acorns are preferred, and they have been chiefly obtained in the State of Missouri. They are generally planted on sandy or broken land that is intended for pasturing sheep. In Great Britain sheep are accustomed to eat acorns, and it is considered profitable to raise them for sheep food. No variety of oak has received much attention at the hands of the planters of fruit trees. They state that that the trees make a very slow growth and for this reason they prefer to plant trees that grow rapidly and furnish fuel and timber in a shorter time. A foreign writer suggests that oak may be raied to excellent advantage in connection with other varieties of trees that grow rapidly. He admits that oaks grow slowly while they are young, but states that they increase in size rapidly when they are fifteen or twenty years old. If care is exercised they may be cut down so as not to injure the young oaks. These trees being removed the young oaks will grow rapidly and completely occupy the ground. Oaks are easy to propagate, as the acorns can be obtained at small cost and are almost certain to germinate. Acorns are much easier to manage than large nuts like those produced on the hickory or pecan tree. They can be planted where it is desired to have them grow, or in nursery rows, from which the small trees may be taken up when they are at a suitable size to be transplanted. The wood is excellent for fuel, timber and post. —*New Orleans Times.*

ROOFS OE PAPER

A roof pronounced superior to that of slate, because of its lightness and other advantages, is now made of any fibrous pulp. From this material tiles of any shape desired are formed by pressure under machinery, or any other method which may suggest itself. Pressed into the designs wished for the pulp tiles are partially dried previous to being subjected to a water-proof solution. Thoroughly impregnated with the preparation to resist moisture they are baked to harden in them the water-proof mixture. After the baking the tiles are treated to a mixture imparting an enameled surface; to this is added a coating of sand, whereby the pulp is rendered proof against the action of heat or flame. By the use of different colored sands a variety of tints may be imparted to the tiles, which, after the application of the enameling mixture and sands are baked a second time, after which they are ready for use. Besides the inherent lightness of pulp ties, which obviate the necessity of a heavy frame to support a weighty roof, the pulp tile, being tough and not brittle like slate, is far less liable to be broken from blows, stones thrown upon them or human footsteps. Again, slate tiles cannot be laid compactly together on a roof, on account of their brittleness, which prevents their being drawn tightly together by nails. Through the fibrous pulp nails may be driven as close home as in shingles, thereby bending them closely to the bed and together without any possibility of lateral movement, or being blown away in a high wind, as slates loosely fastened on roofs so frequently are. Nails penetrate the pulp tiles more easily than shingles, and lie closer together, being more elastic than wood.—*Boston Journal of Commerce.*

TEETH AND SPEED.

The kind of teeth and the speed of the saw should be determined by the hardness and grain of the wood, its greater or lesser freedom from moisture, from gummy or resinous matter, whether frozen or not, also its size. The harder and the smaller the more upright should be the teeth, and the less their velocity and rate of sawing. Pine, willow, and alder require large, acute and well-pitched teeth; oak, mahogany, and rosewood, need perpendicular teeth, close together; yellow and pitch pine and larch being gummy and resinous, require grease to clear the blade; California redwood cuts like eastern pine. It is generally concluded that for pine, spruce, and hemlock the teeth should be cut tangent to a circle half the saw's diameter. Cedar cuts best with a peg tooth of fine gauge, pitch and space. Mahogany, ash and English elm are best cut with the gullet or mill tooth, of small space and nearly upright pitch. For maple, oak, and all timber known as hardwood, swaged teeth answer. For hardwood in warm weather, Norway pine, and chestnut, teeth partly bent and partly swaged are often used. For water-soaked spruce and pine spring-set teeth are generally used.— *Timber Trades Journal.*

A SUMMARY of last year's lumber business in Minneapolis, as given by the *Pioneer-Press*, shows a decrease in the mill cut over the previous year of about 130,000,000 feet, a decrease in the boom scale of about 14,000,000 feet, a decrease in receipts of about 13,000,000 feet, and a decrease in shipments of about 8,000,000 feet. The figures for ten years past, however, show a large increase in business, and the reduction of last year was only an incident of the general depression prevailing everywhere.

Chips.

VASSAR, Mich., has a new company engaged in the manufacture of wood paving blocks.

THERE is a mill being built at Tower, Minn., which is surrounded by pine enough to last forty years if cut at the rate of 100,000 feet a day.

NEW YORK City imports of lumber from the British Provinces in 1885 amounted to 58,305,420 feet. Of shingles 1,050,000 were imported.

THE exports of lumber, exclusive of hardwoods, from the port of New York during 1885, amounted to 76,079,000 feet. The total value of the exports of wood and its product was $7,001,343.

NEW HAMPSHIRE ships millions of fish barrel staves, made of sapling pine, to Michigan and other States bordering on the lakes. The resinous character of the wood commends it to the packers of fish for holding brine.

THE strength of the chestnutwood is to oak as 54 to 100. Cohesive force, according to Tredgold, is from 9,570 to 12,000; its specific gravity is ·535 according to Tredgold, and ·657 according to Rondelet; weight per cubic foot about 30·6 pounds.

The amount of lumber inspected in Boston during 1885 was 98,498,000 feet compared with 98,741,000 in 1884, and 119,000,000 in 1882. Western and Canada pine are not inspected, and a large amount of yellow pine and spruce goes directly to the yards at the mill inspection.

ABOUT 6 o'clock on the morning of the 13th inst, the saw mill belonging to Mr. Geo. McGregor, lot 31, con. 10, township of Hamilton, Ont, was discovered to be on fire. The mil with all the machinery and a large quantity of lumber were totally destroyed. No insurance. The fire was without doubt the work of an incendiary.

MR. A. HOPPINS, of the Rathbun Company, has purchased the entire cut of the Hinchinbrooke saw mill. It will measure 130,000 feet, and consists of pine, hemlock, basswood, oak, and ash. Mr. Hoppins will also purchase all the ties and fence posts between Kingston and Renfrew.

THE Lethbridge, N. W. T., *News* says:—A party of men came down from the N. W. C. & N. Co's. log camp in the mountains on Tuesday evening. They report that the largest drive ever made in this country will take place in the spring, and that the south fork of the Old Man's river will be full of logs for 15 miles. The logs are said to be best ever got out.

MESSRS. J. A. J. Craig & Co., of Montreal, Quebec, have just fitted out one of the most extensive furniture factories in Canada. Mr. Craig has been for years in this business, and is one of the few men who have grown rich in manufacturing furniture. About a year ago he was burned out, but has concluded to try it again,

THE amount of lumber cut by the saw mills on the line of the Grand Rapids & Indiana railroad in Michigan in 1885 is reported as 240,404,203 feet, of which there was 152,275,478 feet on hand. The amount of shingles manufactured was 244,248,000, of which 38,250,000 were reported on hand at the close of the season.

A COMMON method of grafting is to make a transverse section in the stock and a vertical slit above it, and the bud is pushed upwards into its position; this method, we believe, if carefully done, rarely fails. As the sap descends by the bark the bud thus placed above the transverse section receives abundance. There are numerous other methods.

A LEGAL case which came up at Toronto on Jan. 18th is thus reported:—*Re* Rainy Lake Lumber Co.—J. D. Edgar for the Toronto General Trust Company moved on petition under 45 Vic., cap 23, sec. 43, for possession of properties embraced in mortgages to the applicants. J. R. Roaf for the company. W. A. Foster, Q. C, for shareholders and contributories. Motion suspended for one month, the company to pay debenture holders within one month, if payment not made, order for possession to go. Costs out of estate.

MOUNTAIN MAHOGANY.

In Nevada there is a peculiar wood known as mountain mahogany. The tree does not grow large. A tree with a trunk a foot in diameter is much above the average. When dry the wood is about as hard as boxwood, and being of a very fine grain might no doubt be used for the same purpose. It is of a rich, red color, and very heavy. When well seasoned it would be a fine material for the wood-carver. In the early days it was used in making boxes for for shafting, and in a few instances for shoes and dies in quartz battery. Used a fuel it creates intense heat. It burns with a blaze as long as ordinary wood would last, and then is found (almost unchanged in form) convert to a charcoal that lasts about twice as long as ordinary wood. For fuel it stands much higher than any other kind of wood; indeed, a cord of it always brings the same price as a ton of coal. The only objection to it as a fuel is that it creates such an intense heat as to burn out stoves more rapidly than coal, however bad.—*Exchange.*

Ancient Saw Mills.

More than 300 years ago an English historian gave the following description of a saw mill: "The saw mill is driven with an upright wheel, and the water that maketh it go is gathered whole into a narrow trough, which deliverth the same water to the wheels. This wheel has a piece of timber put to the axle tree end, like the handle of a broch, and fastened to the end of a saw, which, being turned by the force of the water, hoisteth up and down the saw, that it continually eateth in, and the handle of the saw is kept in a rigall of wood from swerving. Also the timber lieth, as it were, upon a ladder, which is brought by little to the saw with another vice."

Catarrh—A New Treatment.

Perhaps the most extraordinary that success has been achieved in modern science has been attained by the Dixon treatment for Catarrh Out of 2,000 patients treated during the past six months, fully ninety per cent. have been cured of this stubborn malady. This is none the less startling when it is remembered that not five per cent. of the patients presenting themselves to the regular practitioner are benefitted, while the patent medicines and other advertised cures never record a cure at all. Starting with the claim now generally believed by the most scientific men that the disease is due to the presence of living parasites in the tissues, Mr. Dixon at once adapted his cure to their extermination; this accomplished the Catarrh is practically cured, and the permanency is unquestioned, as cures effected by him four years ago are cures still, No one else has ever attempted to cure Catarrh in this manner, and no other treatment has ever cured Catarrh. The application of the remedy is simple and can be done at home, and the present season of the year is the most favorable for a speedy and permanent cure, the majority of cases being cured at one treatment. Sufferers should correspond with Messrs. A. H. DIXON & SON, 305 King street west, Toronto, Canada, and enclose a stamp for their treatise on Catarrh.—*Montreal Star.* 1y122.

Wrought Iron Shanty Cook Stoves

The Best Article Ever Offered to the Trade.

I have much pleasure in drawing attention to my **WROUGHT IRON COOKING STOVE, for Shanty, Hotel and Boarding House use.** These stoves are made of **Heavy Sheet Iron,** the top and lining of the fire-box being of **Heavy Cast Metal** and all the connecting parts of substantial **Wrought Iron Work.** The dimensions of these Stoves are as follows:

SINGLE OVEN STOVE

Top surface contains six 10-inch holes, with ample room between, and one oven 28 x 24 x 19. Fire box takes 28-inch wood.

DOUBLE OVEN STOVE

The Double Oven has a top surface containing twelve 10-inch pot holes, with two ovens, each 28 x 24 x 19. One fire-box of suitable size for area to be heated. Below will be found Testimonials from some of the leading Lumbermen, who have used my **Wrought Iron Cook Stoves** since I commenced manufacturing them. They are the names of gentlemen who are well known and reliable, and will carry more weight than any recommendation of my own could do.

The Best Stove I have ever Used.

PETERBOROUGH, May 31, 1880.

ADAM HALL, Esq., Peterborough. Dear Sir,—I have used your Wrought Iron Cooking Stove in our lumbering operations since its introduction here, and have no hesitation in saying that I prefer it to any other. For durability, economy and efficiency, where a large number of men are employed, it is the best stove I have ever used. You can, with confidence, offer it to hotels, boarding houses and lumbermen.

Yours truly, THOS. GEO. HAZLITT.

The Stove for Lumbermen.

PETERBOROUGH, June 1st 1880.

ADAM HALL, Esq., Peterborough. My Dear Sir,—We have used your Wrought Iron Cooking Stove and find it is very satisfactory for lumber operations, especially so on drives. We can recommend it highly.

Yours truly, J. M. IRWIN.

In addition to the above I can refer you to the following lumber firms who use my Wrought Iron Range exclusively in their camps:—

THE GEORGIAN BAY LUMBER CO.....Waubaushene
THE LONGFORD LUMBER CO.....Longford Mills
MESSRS. GILMOUR & CO.....Trenton and Ottawa
MESSRS. RATHBUN & CO.....Deseronto
THE MUSKOKA LUMBER CO.....Gravenhurst

EVERY STOVE GUARANTEED.

All the necessary TINWARE and CUTLERY for Shanties Supplied at the Lowest Prices.

Advertisements intended for insertion in any particular issue should reach the office of publication at least four clear days before the day of publication, to insure insertion.

All communications, orders and remittances should be addressed and made payable to THE PETERBOROUGH REVIEW PRINTING AND PUBLISHING COMPANY (LIMITED), Peterborough, Ont.

Communications intended for insertion in the CANADA LUMBERMAN, must be accompanied by the name of the writer, not necessarily for publication, but as a guarantee of good faith. Communications to insure insertion (if accepted) in the following number, should be in the hands of the publishers a week before the date of the next issue.

The CANADA LUMBERMAN is filed at the Offices of MESSRS SAMUEL DEACON & Co., 154 Leadenhall Street, London, England, who also receive advertisements and subscriptions for this paper.

PETERBOROUGH, Ont, FEB. 1, 1886.

MICHIGAN parties have recently bought a single birth on the Spanish River for a consideration of $120,000.

NEW buildings to the cost of $2,300,000 were erected in Montreal, Ont, during the past year.

THE Kingston & Pembroke Railway Company has purchased the car works at Kingston, Ont., for $20,000.

MOSES BALLAH, while chopping near Essex Centre, Ont., was instantly killed by a falling limb.

IN some parts of northern Michigan cedar ties have advanced from 16 to 18 cents each, and posts from 5 to 6 cents.

A RELIABLE authority makes the statement that there will be six hundred miles of new railway completed in Missouri the present year.

EZRA RUST, of Saginaw, Mich., sold this week 30,000,000 feet of pine on Tobacco river to A. A. Brockway, of the same place for $200,000.

THE brig Adria, from St. John, N. B., for New York, with lumber, put into Vineyard Haven, January 13th, having lost part of her deck load in a heavy gale.

GOW & MAJO shipped 1,100 tons of sawdust from Muskegon to South Chicago last year for terra cotta manufacture. Next year they propose to ship 100 tons a week.

THE boom in Muskegon river, above Newago, broke loose lately and 500,000 feet of logs went down the river. The logs belonged to the Newaygo Manufacturing Company, and will have to be sawed at Muskegon.

A BIG tree was recently cut at Moore & Tanner's camp on the Au Sable riverr It was cut into a stick 108 feet long, which measured 27 inches at the top and contained 10,300 feet.

A YOUNG man named Addison, of Minden, had his thigh bone broken recently in one of the Parry Sound Lumbering Co.'s camps by a log rolling down from a skidway, over a sleigh, and striking him.

THE Emery Lumber Company of Bay City have about 15,000,000 feet of logs skidded on one of the branches of French River. The timber is said to be of superior quality and will be taken to Tawas for manufacture.

MESSRS. Folsom & Arnold, of Bay City and Albany, are owners of very valuable timber on the Spanish river and have a saw mill at its mouth—the first mill there. Their cut the past season was about 12.000,000 feet, averaging about ten per cent. to uppers.

AMERICAN pitch pine appears to be as much a pet of the German revenue system as American hog products. Besides a duty of 30 per cent levied upon the importation of American pitch pine, the railroads of Germany, which are under governmental control, make an almost prohibitory discrimination against it. If any part of a car load is pitch pine the whole load is classed as such.

As much as it has been predicted that walnut would be hustled aside by other woods, says the *Northwestern Lumberman*, it is still in the ring as vigorous as ever. Good walnut lumber finds ready sale in any of the leading markets, and buyers from both home and foreign markets are busy looking it up. Any other wood that grows will have more than it bargained for if it at tempts to satisfactorily take its place."

SINCE the recent sale of newly offered berths by the Crown Land Department, says a Toronto report, there has been greater activity in Algoma timber sales than for years and the value of stumpage has considerably appreciated Transactions in limits appear to be on the basis of from $1 to $2 per thousand feet for white pine. In some cases the Algoma birch is a very valuable item, but account is rarely taken of the Norway or spruce in fixing values.

MIRAMICHI.

J. B. SNOWBALL'S wood trade circular for the year 1885 has been received. It states that the depression which existed during 1884, and which was supposed to have reached bottom, has continued through the year 1885, now closed. The advisability of the Provincial Government continuing its present policy in regard to the tax on the timber supply is questioned. It is pointed out that while in 1884 the tax represented only about 20 cents per thousand superficial feet, it is now increased until the direct tax and land tax (the tax is levied in two forms) amount to $1.40 per thousand superficial feet. The shipments from that port for the year show a falling off of 20 per cent from last year, and last year's was 27 per cent. less than the year 1883. The total shipments from the Province show a shortage of 12 per cent. There would have been a much greater reduction, says the circular, were it not for the excessive quantity of Nova Scotia goods shipped from St. John this season, which passed as St. John production. Nova Scotia shipments, however, show an increase of 5,277 St. Petersburg standards, the figures being 40,221 stds. in 1885 against 34,944 standards in 1884. The only ports in New Brunswick that show any increase are Sackville, Shediac and Cocagne, all ports bordering on Nova Scotia.

The stock being wintered is estimated at 17,000,000 superficial feet, against 26,000,000 last year and 40,000,000 in 1883. The amount of work being done in the forests is small, much less than for many years past, and this, with the very small stock being held over, will make next season's shipments show a still further reduction, which must continue as long as the present unremunerative prices prevail. The stock being wintered at St. John, and also the new supply, are on a restricted scale, and consequently all are being held for improved prices.

The shipments for the past ten years from Miramichi, given in superficial feet, were as follows: –

	Sup. Ft.
1876	116 000,000
1877	150,000,000
1878	106,000,000
1879	114,000,000
1880	155,000,000
1881	128,000,000
1882	117,000,000
1883	149,000,000
1884	108,000,000
1885	87,000,000

The distribution of the shipments in 1885 was as follows:—To Great Britain, 47,239,692 sup. feet; Ireland, 24,984,538; France. 10,223,213; Australia, 1,534,672; Africa, 2,262,198; Italy, 1,005,715; total, 87,250,028.

The shipments from St. John to trans-Atlantic ports for the past 8 years were as follows:

	Sup. ft. Deals.	*Birch.*	*Pine.*
1878	188,163,610	7,989	2,493
1879	153,279,357	11,548	3,237
1880	215.485,000	16,035	2,441
1881	210,281 730	5,134	1,734
1882	201,413,717	7 576	3,332
1883	181,517,932	11,778	3,883
1884	164,829,825	14 006	3,836
1885	152,543 026	13,769	3,686

Dalhousie and Campbellton, in 1885, shipped 13 796,950 super. feet deals, scantling and ends and 5,267 tons timber; Richibucto and Buctouche, 11,909 050 super. feet; Bathurst, 10,-160,242 feet, 29 tons birch and 588,140 pieces palings; Shediac, 5,797,035 super feet; Caraquet, 2,231,787 super. feet, 56 tons timber and 111,000 pieces palings; Sackville, 7,117,000 super. feet.

The total lumber shipment of New Brunswick in 1885, compared with 1884, was as follows:

	1884.	1885.
No. of vessels	595	519
Tons	390,185	343.988
Sup. ft. deals, etc	.333 191,893	291 747,383
Tons timber	26,939	27.738

The shipments from Nova Scotia in 1885 were as follows:—No. of vessels, 172; tonnage, 92,-087; sup. feet deals, etc., 79,647,765; birch timber, 8,389; palings, 13,346. The shipments of deals from Nova Scotia to trans-Atlantic ports in the years mentioned were:—

1882	85,752,000
1883	77.918 000
1884	69,159,000
1885	79,647,765

The shipments of deals, etc, given in superficial feet, from the Nova Scotia ports mentioned, were as follows:—Guysborough, 2,061,642; Shelbourne, 704,880; Pictou, 300,795; Yarmouth, 2,516,250; Parsboro, 31 383,000; Port Medway, 525,000; Margaret's Bay, 2 000 000; Amherst, 16,124,947; Halifax, 12,155,251; Ship Harbour, 1.500,000; Sheet Harbour, 6,000,000; Liscomb, 752,000; Bridgewater, 3,624,000.

THE PINE TREE OF KARASATE.

A few miles from Otsu, Japan, is Karasate, a little point of land running into the lake, where a Shinto temple has stood for centuries. The shrine is covered by the arms of a pine tree, whose trunk is more than four feet in circumference, and the branches, trained out on supports, cover over an acre of ground. Of all the wonders of this part of the world, this old pine tree of Karasate deserves a first mention, and one wanders amazed under the great canopy of long drawn out, interlading branches, and studies the intricate way in which the limbs of the sturdy old pine have been twisted, looped, tied and braided, as if they had been so many sticks of candy. The ends of the branches reach out over the water on either side, and a heavy stone wall on the lake front protects the venerable tree from ever being washed away by storms or floods. There is a tiny little box of a shrine up among the branches, and the pilgrims look strangely enough when they clap their hands loudly and stand with clasped palms, turning their faces up to the branches overhead.

All the small children in Karasate followed us about as we wandered under the gnarled branches of the pine tree, half of the small boys and girls carried a smaller brother or sister on their backs. One dear bright-eyed little rascal capered about most bewitchingly, and hardly left my elbow. When I sat down he sat down and kicked his sandalled feet against me. He leaned over and read the same page of the guide book with me; discovered my watch, held it in his hand to hear it ticking, and made himself at home in the most betwiching, half-timid and polite way. The other children, drawn up in a silent array before us, wondered no less at the foreigners themselves than at the favor or audacity of their young companion.

When we finally rose I picked up a few cones and the empty shell of a skin from which some locust had lately flown. A sweet shy little girl saw me doing it, and ran to gather more and present them with many bows, the head of her baby brother on her back bobbing and rolling around alarmingly as she did it. The present of a big copper cent made her bow more than ever, and in a second the whole troop of youngsters were off over the sand and up the tree hunting for cones and locust shell.—*St. Louis Globe-Demacrat.*

LONDON TRADE OF 1885.

The annual circular of Simson & Mason, of London, says: Since the year 1881 the wood trade of the port of London has been most unsatisfactory, alike to shippers and importers. 1885 has closed, and resembles for the most part the previous years. All branches of industry throughout the country have continued depressed, and the wood trade has been in sympathy. Until there is a better tone in the general trade of this country it would appear that the wood trade is not likely to show much improvement. The recent fall-off in consumption is, in a large measure, due to the suspension of building operations in the metropolis and its suburbs; from this large and active source of consumption the demand has been for some months past gradually falling away. London has been overbuilt and requires some period of rest Although there are no immediate signs of a better state of things, yet there is concurrent opinion that prices have seen their lowest and any change must be for the better. Money was made and lost during the spring of the year through a "war scare" which soon subsided, and this has been the only exception to the monotony of dullness which has characterized the past year. Freights have ruled exceedingly low from all ports, and some wood charters have been closed, perhaps, at a cheaper rate than ever previously known.

The total import amount to 806,000 tons, being a reduction of 40 000 tons on 1884, and 30,000 below the average of the last five years. The total consumption, as indicated by the deliveries from the Surrey Commercial and Millwall Docks in sawn and planed wood, has been 205,050 Petersburg standards, against 232,000 Petersburg standards in 1884 being a fall-off of 12 per cent. Compared with 1883, the fall-off is 13 per cent., with 1882 15 per cent., and with 1881 18 per cent. The fall-off as against last year equals about 500 Petersburg standards per week. Of hewn wood, excluding sleeps, the consumption, as indicated by the Surrey Commercial Dock deliveries, has been a fair average one, amounting to 69,000 loads against 68,000 in 1884.

WHY WILL YOU cough when Shiloch's Cure will give give immediate relief Price 10 cts 50 cts, and $1. For sale by Ormond & Walsh druggists, Peterborough.

DR. CARSON'S STOMACH BITTERS will cure the worst forms of Dyspepsia, Indigestion, and all bilious complaints. Large bottle, 50 cents. Go to your druggist and get a bottle.

Advice to Mothers.

Are you disturbed at night and broken of your rest by a sick child suffering and crying with pain and cutting teeth? If so, send at once and get a bottle of Mrs. Winslow's Soothing Syrup for children teething. Its value is incalculable It will relieve the poor little sufferer immediately. Depend upon it, mothers, there is no mistake about it. It cures dysentery and diarrhœa, regulates the stomach and bowels, cures wind, colic, softens the gums, reduces inflammation, and gives tone and energy to the whole system Mrs. Winslow's Soothing Syrup for children teething is pleasant to the taste, and is the perscription of one of the oldest and best female nurses and physicians in the United States, and is for sale by all druggists throughout the world Price 25 cents a bottle.

HARRIS, HEENAN & Co.

124 AND 126 QUEEN STREET, - - MONTREAL.

Patent Stitched–Steam Power Pressure Stretched–Oak Tanned

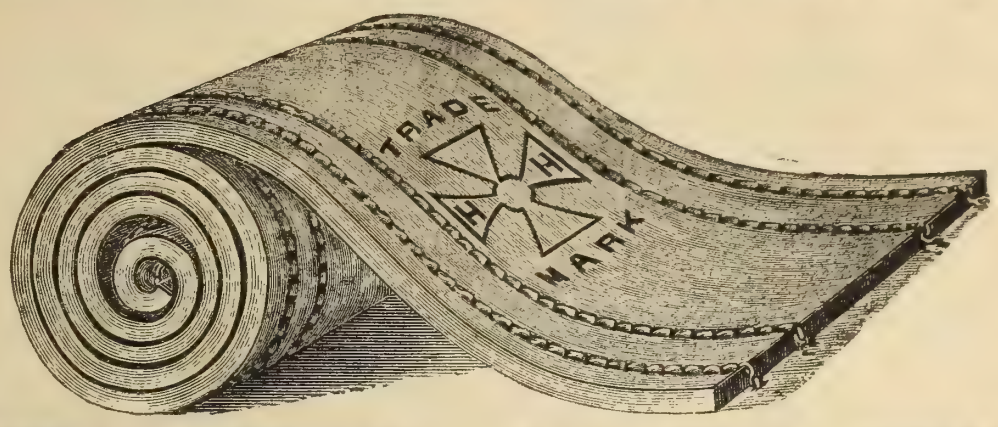
TESTIMONIAL

IRA GOULD & SONS, CITY MILLS, Nov. 13th, 1884.

Harris, Heenan & Co.

DEAR SIRS.—Your Patent Sewed Belt has been in use in our "City Mills" for some time. We are thoroughly convinced of its superiority over any belt, American or Canadian, we have used in an experience of over 35 years. It stretches so little, and gives so little trouble, that compared with riveted belting, the sewed belt saves double its price in time and laces saved. We heartily recommend it to manufacturers as the cheapest and most satisfactory belt in the market

Yours respectfully,
W. C. MARSHALL,



TESTIMONIAL.

PECK, BENNY & CO., CANAL HORSE SHOE AND NAIL WORKS, MONTREAL, 15th Nov. 1884.

Messrs. Harris, Heenan & Co., Montreal.

I have pleasure in recommending the belting manufactured by Messrs. Harris, Heenan & Co., of this city. After thoroughly testing it, I find it greatly superior to any belting that has come under my notice and fully equal to all they claim for it, and certainly without an equal for strength or double belting.

CHAS. R. ELLACOTT,
Supt. H. S. & H. N. Dept.

LEATHER BELTING!

The Best, therefore the Cheapest, Belt in the market.
Replaces, when used, all others.
More Pliable and Durable, especially at the splices.
Stretches but little, always retains it original wid h.
Superior for Cross or Double Belts.
Runs sraight and true, does not start at the laps.
Single equals medium double.

25 per cent Stronger, 33₁ More Lasting, and 12⅓ Heavier, than any other Leather Belt

BOARD OF TRADE RETURNS.

The following are the returns issued by the Board of Trade, for the month of Dec. 1885, and also for the 12 months ending Dec., 1885:

MONTH ENDED 31ST DEC., 1885.

Timber (Hewn).	*Quantity. Loads.*	*Value. £.*
Russia	6,346	12,857
Sweden and Norway	24,683	84,286
Germany	9,997	29,270
United States	6,111	22,986
British India	5,196	71,351
British North America	10,995	45,696
Other Countries	33,705	36,727
Total	97,033	253,173
Timber (Sawn or Split, Planed or Dressed).		
Russia	32,060	57,408
Sweden and Norway	44,948	101,549
British North America	66,540	151,547
Other Countries	17,171	58,799
Total	160,719	369,303
Staves, (all sizes)	3,642	58,632
Mahogany (tons)	2,283	19,020
Total of Hewn and Sawn	257,752	622,476

TWELVE MONTHS ENDED DEC. 31ST, 1885.

Timber (Hewn).		
Russia	258,857	465,805
Sweden and Norway	540,217	758,826
Germany	289,555	693,247
United States	138,593	470,984
British India	42,588	576,724
British North America	255,264	1,108,829
Other Countries	409,587	557,760
Total	1,934,661	4,632,175
Timber (Sawn or Split, Planed or Dressed).		
Russia	1,188,380	2,551,123
Sweden and Norway	1,716,456	3,602,247
British North America	995,374	2,437,629
Other Countries	330,108	996,602
Total	4,230,318	9,587,601
Staves (all sizes)	124,374	588,971
Mahogany (tons)	55,889	486,193
Total of Hewn and Sawn	6,164,979	14,219,776

SHILOH'S VITALIZER is what you need for Constipation, Loss of Appetite, Dizziness and all symptoms of Dyspepsia. Price 10 and 75 cents per bottle. For sale by Ormond & Walsh druggists, Peterborough.

THE LUMBER TRADE.

QUEBEC, Jan. 27.—Information from the woods is to the effect that unusual activity prevails this winter in the pine lumbering districts of the province. The decline in the square timber trade is likely to become permanent from present indications, and the export trade in deals and dimension timber will probably increase in direct ratio to the decrease of the other. It is reported that the immense stock of sawn lumber at the Gatineau Mills' piling ground, Cheslea, has been disposed of for Spring delivery. The firm operating these mills, Messrs. Gilmour & Co." are exceptionally busy on the Gatineau River this winter and will probably drive over 200,000 logs next spring. The firm has lat ly acquired the limit so long held by Mr. Willis Russell of this city, and may berhaps cut some pine there this season. The Kapabourga limit. formerly the property of Messrs. Benson, Cennet & Co, has also been bought by the Messrs. Gilmour. Mr. J. MacLaren is also actively engaged on the Eagle, Ignace and Desert rivers, doing most of his business through jobbers. Messrs. Hamilton Bros. are doing rather more than usual on the Gatineau, and expect to drive from 80,000 to 90,000 logs of the finest quality and the largest size. They are busy as usual on the tributaries of the Grand or Ottawa river. All of this firm's timber will be cut at the Hawkesbury mills sixty miles below Ottawa on the Ontario side of the river. and for the future will be taken to the seaports for exporation by barge, this plan having been found to have many advantages over rafting, which involved several handlings of the lumber, as well as the scouring of each board by machinery. On the Black and Colcunge rivers. Messrs. Gillis and others are doing a large winter's w rk. The sale of the old Bronson business for $600,000 circles, and some doubt is expressed as to whether the immense limits above the Boscatong on the Gatineau which cover 900 square miles of conntry, are included in the purchase. So far little is known of the intentions of the new firm, which includes Mr. Stewart, late of New Brunswick, and now of London, England, Mr. Bronson, and some others not so well known to the trade. The Messrs. Greer Bros., of Montreal, have also purchased limits on the Gatineau, and will probably work them before long.

Horsford's Acid Phosphate

Very Satisfactory in Prostration.

Dr. P. P. Gilmartin, Detroit, Mich., says: "I have found it very satisfactory in its effects, notably in the prostration attendant upon alcoholism."

The discovery of the instantaneous process of taking photographs has been quickly followed in the medical world by a perfect and instantaneous remedy for all acute aches and pains, as Neuralgia, Toothache, Rheumatism, etc. This valuable remedy is called Fluid Lightning, and is sold at 25 cents a bottle by John McKee, druggist.

WELLAND CANAL.

NOTICE TO CONTRACTORS,

SEALED TENDERS, addressed to the under-igned and endorsed "Tender for Lock Gate Timber," will be received at this office until the arrival of the Eastern and Western Mails, on TUESDAY, the 9th day of FEBRUARY next, for the furnishing and delivering, on or before the 22nd day of June next, 1886, of Oak and Pine Timber, sawn to the dimensions required for increasing the height of the Lock Gates on the Welland Canal.

The timber must be of the quality described and of the dimensions stated in a printed bill which will be supplied on application, personally or by letter, at this office, where forms of tender can also be obtained.

No payment will be made on the timber until it has been delivered at the place required on the Canal, nor until it has been examined and approved by an officer detailed to that service.

Contractors are requested to bear in mind that an accepted bank cheque for the sum of $600 must accompany each tender, which shall be forfeited if the party tendering declines to enter into a contract for supplying the timber at the rates and on the terms stated in the offer submitted.

The cheque thus sent in will be returned to the respective parties whose tenders are not accepted.

This Department does not, however, bind itself to accept the lowest or any tender,

By order.

A. P. BRADLEY,
Secretary.

Department of Railways and Canals,
Ottawa, 22nd January, 1886. 4

SNOW DRIFT

BAKING POWDER

The Peoples' Favorite.

w5

Health is Wealth

DR. E. C. WEST'S NERVE AND BRAIN TREATMENT, guaranteed specific for Hysteria, Dizziness, Convulsions, Fits, Nervous Neuralgia, Headache, Nervous Prostration caused by the use of alcohol or tobacco, Wakefulness, Mental Depression, Softening of the Brain resulting in Insanity and leading to misery-decay and death, Premature Old Age. One box will cure recent cases. Each box contains one month's treatment. One dollar a box, or six boxes for five dollars; sent by mail prepaid on receipt of price. We guarantee six boxes to cure any case. With each order received by us for six boxes, accompanied with five dollars, we will send the purchaser our written guarantee to refund the money if the treatment does not effect a cure. Guarantees issued only by J. D. TULLY Druggist, Sole Agent for Peterborough.

A GIFT Send 10 cents postage, and we will mail you *free* a royal, valuable, sample box of goods that will put you in the way of making *more money* at once, than anything else in America. Both sexes of all ages can live at home and work in spare time, or all the time. Capital not required, We will start you. Immense pay for sure for those who start at once. STINSON & Co., Portland, Maine.

CYLINDER LUBRICATION.

In former years it was the universal custom to lubricate the valves and cylinder of a steam engine with tallow by means of the old-fashioned cup with which every one is familiar. While tallow in either the crude or prepared state made a good lubricant for many kinds of work and machinery, it was very bad for steam valves or cylinders, not because it was a poor lubricant, for on the contrary it was as good as could be found in those days for the purpose; but the objection to it was the large percentage of acid it contained. Unless great care and frequent cleaning of parts were observed they were observed they were liable to severe corrosion; the valve seats and cylinder would become so corroded or eaten into by the deposits of acids that they have to be re-bored and re-fitted; piston rods became spoiled and had to be replaced; piston springs deteriorated, and piston bolts would almost break in pieces at the slightest pressure of the wrench. Constant repairs on engines having duty to perform were the order of the day, incurring heavy expense and tedious delays. To overcome these serious objections and substitute a lubricant that would be as good for the intermediate steam chambers of the engine and obviate the objections to tallow was a problem the solving of which engaged the minds and attentions of chemists, oil manufacturers, engineers and mechanics alike.

The results of their efforts brought forth cylinder oils of various brands for the sole purpose of lubricating the internal parts of the engine containing steam. They also incidently brought forth numberless sight feed oil cups of several qualities. These oil cups were a thing of beauty and joy forever. The engineer could take out his Waterbury watch and time the drops of oil to suit the duty of the engine, and the proprietor could figure to a nicety how much oil per day was used, and easily got at the cost per year. He did not have to run to the butcher's every once in a while, only to find that some old lady had bought the last lot of tallow; he found when he first started the sight feed cup that the oil men sent enough sample cans gratis to keep him in oil several months. The valve seats, cylinder springs, etc., would invariably present a smooth, even appearance upon examination and everything was lovely for a time. The problem of lubricating the steam engine was solved and consequently every one was happy. After a short time some observing engineers who utilized all their returns from steam heating coils and other sources, discovered that their boilers were not so clean as they had been previous to the use of oil. Careful investigation proved the fact that the cylinder oil returned through the heater with the water. This was all right if it either made steam or was otherwise harmless, but such was not the case. The deposits of oil gradually increased to an alarming quantity and proved detrimental to the boiler.

It did not seem to form a very hard scale, in fact, it was of a soft, mushy consistency. This it seemdeposed to have a great affinity for the ends of the flues, especially the back end, keeping the heat and water apart and causing the flues to leak and gradually harden. I have just seen a large tubular boiler that was built by a first class concern whose name is a guarantee of its quality, which was placed three years ago in charge of a good, careful engineer. That boiler is now receiving a new set of tubes. The ends next the back head were leaking and were so hard that when struck by a chisel it would fly like glass. I might add that the sediment around the tubes was considerably harder than anywhere else. The reason is obvious. The heater, which was of the plain tank style, was in about the same condition, and is being replaced by a new one of a kind that is guaranteed not only to heat but to deposit the sediment in the bottom and thence carry it out through the overflow. The total expense will not be less than five hundred dollars, a very large item to pay for this kind of experience. In connection with all this, a different brand of cylinder oil will be used, and if beneficial results follow it will be hard to determine whether they are caused by the change in heater or oil. A smilar case occurred not long since at a large factory having one of the leading well known heaters that was intended to purify as well as heat the return, etc. After four years run new flues had to be put in and a large, new heater with all necessary connections was introduced, causing an outlay of at least twelve hundred dollars, all on account of the cylinder oil.

In another factory having a thirty-horse boiler, where at least two-thirds the supply used is rain water, the boiler is washed out very carefully every two weeks, and about two quarts of crude petroleum placed therein, and so far, (one year's service), no trouble has occured, the scale of film found on cleaning the boiler being very thin and light. In another case where a certain brand of oil was used, it was found that the piston moved hard, and the more oil it received the worse it became. Upon taking the cylinder head off, the cylinder was found to be coated with small, greasy, sticky pellets, from the size of a pin head upwards. The steam ports were clogged up with this interesting stuff that resembled greasy clay. After carefully wiping out, a different brand of oil was introduced that very quickly cleaned out the ports and loosened out the piston rings until they rattled about. This certainly showed a considerable difference in the two brands of oil. One would lubricate, and did not form the sticky pellets, and would allow the engine to work under much less pressure, while the other produced the opposite effect. As to the effect of the otherwise good oil on the boiler, I have not yet learned, but I presume it is much better.

These few incidents that have come under my recent observation have demonstrated the fact that either there are very good and very bad oils for cylinder lubrication, or that all of them have some foreign stuff used in their manufacture for clarifying, or that they have some radical defect that leaves us no better off than with the old oil and tallow cups. I am strongly inclined to the first theory, from the fact that I know of factories where a certain brand of oil was used constantly for a number of years, having the same kind of plant throughout, and using the same water from the city service, that upon repeated careful internal examination showed no deleterious effects. In view of all these facts, it is economy to buy any cylinder oil because its first cost is low? On the contrary, it is a strong illustration of the good old adage, "the best is the cheapest." No man running a steam plant can afford to use an inferior grade of cylinder oil, even if he gets it for nothing. He would have to receive a present of a great may barrels of the stuff to compensate for the expense of overhauling the whole plant every three years, to say nothing of the delay, loss of business, etc. Oil manufacturers may not like this kind of talk, but if it hits any of them hard I would suggest that the remedy of the difficulty is in their own hands. There is no doubt that there is a few leading brands that will stand the test and perform good service, but it is equally patent that a large number of brands are worthless for their intended purpose, and positively harmful and dangerous. No one about to purchase any oil for the purpose, having a heater taking the returns to the boiler, should order until satisfactory evidence has been given that it will not deposit scale in the boiler, and perhaps it would not be amiss to demand a clean cylinder and other parts of the engine as a result of usirg said oil. —*M. E. Chanic, in Lumber World.*

WOOD AND METAL RAILWAY SLEEPERS.

Differences of opinion exist among engineers as to the relative value of wood and iron railway sleepers. The common belief seems to be that both possess qualities that deserve consideration, and that while wood may advisedly be used in some localities, iron is better suited to others. It is mainly, however, a question of economy, and the cost of transit has to be taken into account in association with the price on the market and the relative durability of wood and iron. It is beyond doubt true that a partial feeling has recently found expression in favor of iron or steel in England, while in Germany, where timber is scarce, and the duty upon wood imported from abroad has been increased within the last twelve months, there is probably good grounds for believing that metal sleepers, notwithstanding the fact they are said to cause a vibration in the carriages highly annoying to passengers, may come into very general use. On this important point the *Manchester Guardian* recently published some highly interesting particulars gathered from a recent report presented by Herr Bueck, the General Secretary of the German Ironmasters' Association, to the members of that body. This experienced engineer observes that he regrets to find that, according to certain appearances, wooden sleepers appear again to be coming into favor in Germany, because the several governments seem desirous of favoring forestry. Contrary to the recommendations of prominent engineers, beechwood sleepers have been laid down recently. Herr Bueck adversely criticises the disposition on the part of the Government to bestow special encouragement upon forestry in this way. The duties on timber imposed in 1879 have been raised this year, although the native growth is not sufficient to supply the requirements of Germany. According to a petition presented by the timber growers and merchants to the Reichstag on the occasion of the discussion on the timber duties, it appears that 2,000,000 sleepers were laid to the eastern part of the empire last year, and that of this quantity one-third were metal sleepers. The German forests could only supply 15,000 oak sleepers. Of the quantities submitted for tender during 1884-5, in the same part of the empire, German producers were only able to supply one 1,500 of oak, and 5·04 per cent. of pine. Should beechwood sleepers prove satisfactory, a sufficient supply may be obtained in the western part of the empire. But experiments with sleepers of this wood in France have not given satisfactory results. In favoring the employment of wooden sleepers, therefore, with a view to the encouragement of German forestry, the German Government are simply promoting foreign timber-growing industry rather than the native metallurgical industry."

It may be taken for granted that so far as England is concerned selection will be determined upon principles of economy. If it can be shown upon incontrovertible evidence that iron or steel sleepers are cheaper in the long run than wood, they will assuredly come into general use. On the other hand, should the contrary be established, timber will remain in vogue. Competition between the two interests involved will have a tendency to reduce the price of both wood and metal, and, so far, rivalry will be attended with advantage to the community. They must, however, stand on their merits, and any attempt to foster a trade by protective measures will fail. It is proverbial that there is neither favouritism or friendship in business. Now that the relative qualities of wood and metal are in course of being tested we believe that it will be found that the conditions under which timber sleepers can be obtained in England are of a nature to justify the expectation that they will still remain in use.—*Timber.*

OAK STAVES FOR EXPORT.

The manufacture of oak staves for export is quite an important industry, and there is a considerable amount of capital employed in it. Formerly nearly the whole of the staves for exportation to Europe were obtained from Canada and shipped via New York, but within the last ten years, in consequence of the exhaustion of the oak timber in that country, the trade has drifted southward, and it may be said now to exclusively a southern industry, as for several years past three parts of the whole quantity of staves exported have been obtained from the States of Arkansas, Tennessee and Mississippi.

Large quantities of staves were obtained on the Cumberland and Tennessee rivers, but there is now no stave timber on those streams. The larger portion of the staves shipped in the last two or three years has been obtained from Arkansas and Mississippi swamps.

The new railroad running from Memphis through Arkansas to Kansas City, and from Memphis to Vicksburg and New Orleans, opens up a considerable timber country, and within the last two years a large quantity of staves has been shipped to Europe via New Orleans over these roads. New Orleans is the principal market and shipping point for these staves, while Memphis is the centre of the manufacturing interest.

Large lots of staves are shipped as what is called "dunnage" in the steamers and other ships carrying cotton from New Orleans to Europe. By "dunnage" is meant the portion of the cargo which is heavy and will work with a light, such as cotton or, in other words, acts as a ballast.

The staves for export are made of white oak or timber of the white oak family, such as cow, burr, overcup oak, etc. The timber must be exceptionally good and large, at least 30 inches in diameter, long bodied and free from knots, crooks, wind shakes and shivers, and worm holes.

The stave should be riven with the grain of the wood, setting the frow to run from the bark towards the heart, and splitting the stave to as near an equal thickness on both edges as possible. In sapping great care must be taken to strike the axe in at the end of the stave, and never in the middle, which is a very objectionable defect. A merchantable stave should be of nearly uniform thickness.—*Southern Lumberman.*

BOXWOOD.

The boxwood boom seems to have spent it force, and the market has dropped in the year from $40 to $17 a ton, which is just $3 below the low point it started from. This change comes from the loss of interest in skating rinks, and the consequent abandonment of roller-skate manufacture by some of the largest concerns, notably one in Newark, N. J., that made in 1884 100,000, and one in New York that up to last July had a two-year's business of 350,000 skates. The dissolution of the skating rink syndicate, that for three years has built rinks all over the country, started them and then sold them to local enthusiasts has divided $400,000 on its last year's business, and has been the medium for sale of over 3,000,000 roller skates. The decline of this business is suggested by the fact that where Nosfolk County, Mass., had 15 rinks running last winter, it now has but five. New York's number has been reduced from 23 to eight, and Philadelphia from 13 to six, and those remaining are not liberally patronized. The abandonment of skating rinks has had some influence also over lumber, and is possibly to be in a large degree accountable for the apathy in prices, and their decline is nearly 30 per cent. since December 1884, while birch, which came into favor for rink floors in the summer of 1883, and jumped to $55 a thousand for kiln dried choice stock, is back, like boxwood, to a lower point than whence it started. —*Miss. Val. Lumberman.*

CRANKY MACHINES.

There are times when nearly all machines get cranky. The trouble is often a simple one, and is not infrequently owing to the machinist not knowing his business. But that is not always the case. The very best mechanic in the world gets hold of a nut that is difficult to crack. A machine, no matter of what kind, may work perfectly for months, and then one day something goes wrong with it. The machinist looks at it, examines it, and perhaps he even takes it to pieces and puts it up again, but all of no avail; the machine remains like a balky horse, which nothing will make go. At last the machinist gets tired and goes home, sick of pottering with the troublesome thing. He comes to work the next day, perhaps having forgotten the previous trouble, touches a handle here and a wheel there, drops a little oil in a half dozen places, turns on the steam, and off she goes without a murmur as if nothing had ever happened. It cannot be explained by any one. The only conclusion to be drawn is that he omitted, on the occasion of the stoppage, those little necessary touches of handles, turning of wheels and droppings of oil.—*Wood and Iron.*

To Clean Brass and Steel.

For brass: powder rottenstone, put it into a pint of water, add a teaspoonful of sulphuric acid, apply, then rub off and polish with whiting. For steel: emery powder mixed with turpentine.

CARELESSNESS IN THE BOILER-ROOM.

"Familiarity breeds contempt," is an old saying, says the *Locomotive*, and it is unfortunately true that it holds good in the boiler room. In this case it would be wise to add to the old saw, "and contempt breeds trouble," for many accidents may be traced to the carelessness in management of boilers which naturally follows long connection with them. Especially is this apt to be the case when the man has been so fortunate in his management of a boiler plant for a long time as to have had no serious trouble with it

It is customary with some mechanics to test new boilers, or old ones which have undergone repairs, by simply subjecting them to a high steam pressure. Why any intelligent person should do this simply passes our comprehension. If a boiler is known to be strong enough to sustain a certain pressure, there is no earthly reason to subject it to that pressure. If it is not absolutely certain that it will sustain any given pressure, then it is the height of folly, and it incurs a risk that no man can afford to take, to apply that pressure in such a manner that, in the event of the boiler not proving strong enough to sustain it, an explosion will inevitably occur.

During the past year we have a record of at least three explosions, all attended by loss of life and great destruction of property, from this cause. The danger in such cases is usually greatly increased by caulking the seams, rivet-heads, etc., where leaks exist while the boiler is under pressure.

Another dangerous practice is the caulking of joints in steam pipes while pressure is on. If pipes or fittings are corroded, as they very frequently are in such cases, there is danger that the chisel or caulking tool may be driven through the pipe. In such a case the sudden escape of steam is more than liable to seriously scald the workman. Quite recently, in a neighboring city, a workman was so seriously scalded in this manner that he died from his injuries. The practice is a very dangerous one, and should never be allowed. Of a similar nature to the above, and one which should be as strongly discountenanced, is the practice of screwing up man hole, hand-hole, and similar plates while boilers are under steam, to stop leakage. A great many accidents have been caused in this manner. A few years ago a battery of three horizontal tubular boilers were fired up, and on raising steam the joint of one of the man-hole plates was found to leak quite badly. Instead of letting down the steam and repacking the joint, a wrench was applied, and the attempt was made to stop the leak by screwing up on the bolt. This proving insufficient, a long piece of pipe was slipped over the handle of the wrench, and more force applied The immediate result was the fracture of the man-hole frame, the explosion of the boiler, the destruction of about $10,000 worth of property, and the loss of three lives.

Only a few months ago a similar accident occurred in a large city in one of the Middle States, but in this case the boiler was of the sectional type. A cap covering the end of one of the water tubes began to leak, and two men, armed with a 24-inch monkey-wrench, attempted to stop the leak by screwing up the nut on a ⅞-inch bolt, with 100 pounds of steam on the boiler. Result: one man killed, and two others badly scalded.

Several bad accidents have also happened through the carelessness of men who have tried to take off man-hole and similar plates while boilers were under the steam. This may appear incredible, but it is nevertheless true. Only a short time ago one of our inspectors, while making quarterly visits in a neighboring city, entered a boiler-room, and found a man trying to remove a man-hole plate with 20 pounds of steam on the boiler. He had removed the nut from the bolt, and was trying to drop the plate (in this case the boiler was provided with an internal man-hole frame) into the boiler. He had just begun the job, and the plate, owing to the great pressure on it, had fortunately so far resisted his efforts to dislodge it. It may be inferred that he had a pretty loud call to "get down of that boiler," and very fortunate for him it was, too.

A few months ago a very bad accident occurred in a rubber works, where two men attempted to remove the head from a vulcanizer before shutting off steam. These vessels consist of a cylindrical shell, and the goods to be vulcanized are put in at one end, and the opening closed by a circular plate or door, which is belted to a flange on the end of the cylinder. After the men had removed some of the bolts, the steam pressure proved to be too great for the remaining bolts to withstand, and the head was blown out with great force, killing them instantly, and damaging the building and machinery to a considerable extent.

This list of accidents might be continued almost indefinitely, but we think we have said enough to call the attention of those interested to the fact that too much care cannot be exercised in the management of steam apparatus of all kinds. Eternal vigilance is the price of safety, and it is much easier and more practical to avoid accidents by the constant exercise of the greatest care than it is to dodge the fragments when an explosion occurs.

THE LOGGING OUTLOOK.

In last week's issue of the *Gazette* we noted the apprehensions felt by the lumbermen on account of the soft weather regarding the getting in of a stock of logs sufficient for next summer's cutting. A good deal of delay had been caused and estimators were discounting the stock 10 to 25 per cent off what is required, but a change has come over the spirit of their dreams. Freezing weather has been wafted from the boreal regions, and where snow has not fallen the freeze up has rendered the sprinklers available. There is no trouble about slipping in the logs now. Wisconsin is well supplied with snow—too well supplied, in fact, and in some portions of Minnesota and Michigan there is enough to help very materially in the logging operations. Hay will be made while the sun shines (or doesn't shine) and logs will be rushed to the streams until the skidways are bare. By that time another thaw may occur. We are not quite ready yet to decide that this will not be an open winter. But one thing we are convinced of—and that is, the log crop will not be so much as 25 per cent. short of actual requirements. But there is time yet for an enforced curtailment. This polar wave may pass away and mild weather prevail in February. We shall know more about it anon.

Of operations in the Northwest the Lacrosse *Republican* says:—

At a meeting of the Menominee River Boom Company, held at Marinette last week, at which were present Senator Sawyer, Jesse Spaulding, of Chicago, Congressman Stephenson and others, the members of the company did not appear to be at all alarmed as to the outcome. They will have with this year's cut and what was left over from last year, sufficient stock to keep them running all next season. There are this season about 5,000 men at work on the Menominee and its tributaries. This year's cut was estimated at 372,000,000 feet, but it will fall below that amount. At the close of last season there was 70,000,000 feet on hand, which, together with the cut this winter will give about 400,000,000 feet for use next summer. The cut on the Peshtigo will amount to about 80,000,000.

In the Eau Claire region the anxiety of lumbermen was relieved by the heavy fall of snow which was general over the entire Northwest. The weather has proven so disastrous that it was thought several contractors would have to throw up their contracts owing to financial embarassments, but if favorable weather now sets in they will probably come out all right. The cut will be from 20 to 25 per cent. short of the estimate, which in round figures is 135,000,000 in the Chippewa district, making the total cut in that district, under the most favorable circumstances, between 450,000,000 and 500,000,000. There will be at the end of this week, between 3,000 and 3,500 men at work in the woods.

Black River Falls lumbermen predict a short cut in their region, even under the most favorable circumstances, and a consequent rise in prices next spring.—*Lumberman's Gazette.*

LUMBER DRIVERS' CALKS

FOR USE IN STREAM DRIVING.

Made from the Best Refined Tool Steel and Forged. The method used in tempering leaves every one of the same temper, rendering them stronger and more durable than any other Calks made Samples and prices free on application to the undersigned.

THE

Orono Cant Dog

Strongest and Lightest in the market. Made of Best Cast Steel by drop forging process. The Handles are made of best quality straight grained split and turned Rock Maple, 5 to 6 feet in length, bored specially to suit the pick. Prices on application.

☞A LIBERAL DISCOUNT will be allowed to Bankers, Lumbermen, Manufacturers, Clergymen, School Teachers, Township Officers and others buying their Stationery in large quantities, and also to cash buyers. ☜Estimates given and contracts made for yearly supplies at lowest rates

Market Reports.

TORONTO.

From Our Own Correspondent.

JAN. 25.—Business is now extremely quiet, and will remain so while the present severe weather continues, it will take some days in fact before the railroad companies will be able to do much shunting in the yards owing to the block of snow caused by the last storm. The want will not be severely felt by dealers, as there is but little demand at the yards. The bulk of the lumber now selling is for factory use, 1½ cut up and better being in fair demand and the supply limited. The bulk of that now selling is far from dry, so that the dry houses will be fully occupied until the new cut comes in.

Bill stuff is tending upward. All short stuff will now bring from 50 cents to $1.00 per M more than for the past twelve months. The splenpid sleighing now enjoyed by the mill men will no doubt tend to check any further advance however, as there will be great exertions made to secure a full stock of logs and their efforts bid fair to be crowned with success.

The railroad companies have again started their usual winter campaign of weighing car loads of lumber, and, as it is usual in such cases, the lower priced lumber has to take the brunt. Hemlock seldom escapes the weigh master, and in some cases it becomes a question with the consignor or consignee, as the case may be, as to the advisability of taking delivery from the company, as the amount claimed for freight foots close up to the value of the lumber. Full satisfaction between shippers and the railroad companies will never be arrived at until a lower tariff is made on such heavy and low-priced wood as hemlock. Wood dealers are granted special rates on inferior grades of wood for brick yard purposes, and why not grant the same to dealers in sawed hemlock, large quantities of which await manufacture if it can only be made and shipped at a profit. But at the present time with prices at $2.00 per M below live bill stuff, it cannot be shipped if passed over weigh scales at 9 cents per hundred weight.

There is no change in prices at the yards as yet, although it is quite clear dealers cannot afford to pay present figures and sell as formerly. The consequence is they will not carry more stock than absolutely necessary until it is clear that present prices are to be maintained.

OTTAWA.

From Our Own Correspondent.

JAN. 25.—Reports from different quarters of the upper Ottawa give a most glowing description of the work being done in the woods. The recent thaw which was followed by a sharp frost and a snowfall made roads in the bush just all that the lumbermen could reasonably require, and as a consequence the drawing is well forwarded. The ice on some of the great lakes to the north, however, is said to be anything but good, and the greatest precautions have to be observed by those whose duty it is to forward supplies. Some time ago 15 teams were drowned on Kiffewa Lake while thus engaged. However, it may be said that causalities are very rare, in fact, considering the immense force of men engaged in the lumbering industry, this is a phenomenal year in that respect. Your correspondent had a conversation with one of the largest lumber merchants on the upper Ottawa a few days ago, and his remarks on the prospects of the trade for the coming season all pointed to a prosperous year. This gentleman expects to get to market three rafts of white pine out on Black River alone, and at least one hundred thousand logs. He says that in his long experience he never saw a more favorable year for work in the woods, and from the present depth of snow in the Black river country he anticipates a good flow of water in the spring. In fact the same may be said of all the other steams in this district. The thaw which occured about New Years changed all the snow then on the ground into ice, making it a kind of reserve. The matter of water for getting logs out of the various streams on which they are deposited, is, as everyone acquainted with the business knows, of the first importance, and the cheerful prospects in this respect are most encouraging. Mr. E. B Eddy, one of the lumber kings of the Chaudiere, starts in a few days for an extended trip to Europe, and from thence to South America. It is known that Mr. Eddy undertakes the long journey more for business than pleasure, and hopes to be able to make arrangements whereby he can ship direct to the different markets in Europe and South America without any interference of the middleman. His trip will, it is expected, last over four months. Stocks at the Chaudiere yards may be said to be froze up for the winter, as there is nothing outside the local demands and that itself is but trifling.

CHICAGO.

AT THE YARDS.

The *Northwestern Lumberman* of January 22nd says:—If orders for shipment had been plenty during the past week, but little could have been done on account of the continued stormy weather, with considerable snow Tuesday and Wednesday, making it difficult to load cars. But orders were few, so that the yard men were content to remain in their offices. The monotony of the current time is, however, being somewhat relieved by the inquiry that is awakening. Within the past week the general lumber trade has shown that it still lives and intends to do business for the year to come There are few yards that have not been called upon to make estimates on bills during the past week, and some of them have been heavy. As yet buyers appear to be in no haste about placing their orders, and it is quite likely that the majority of inquiries are merely to feel the market. Yet the season for stocking up in the southern part of the prairie states is near, and, judging from past years, lumber must begin to move in considerable volume during the next two or three weeks. It is generally conceded, likewise, that stocks in retail yards are unusually low, which will necessitate early buying. Under the circumstances, there should be a fair movement of lumber by the middle of February, and undoubtedly there will be unless frequent snowstorms and very cold weather prevent.

When the demand for car strips is taken into consideration, January trade this year will exceed that of last. Buyers are still picking up all the clear white pine short flooring and Norway strips for car siding and decking they can find. In some instances cutting long strips to the required length has been resorted to. There appears to be no limit to this demand, nor will there be until all the available dry stock has been absorbed. Inquiry as to prices paid for such stuff is generally answered by a shrug, or evasive language, though it is insisted that it is bringing higher prices than a short time ago. In fact, there was no market for Norway strips last summer and early fall. Since all the car shops are busy, and some of them refusing orders unless at an advance in values, it can be safely assumed that car stuff will continue to sell and at stiff prices.

The late reduction of five cents a hundred on eastern freight rates has slightly stimulated shipments in that direction. Dealers say that the reduction is too meagre to be of much benefit unless it leads to cuts and soft rates all around. Inquiries from various eastern points are coming in, and there is some shipping of small lots. The desultory trade that sets in to the eastward and southward in the winter time is for specialties, covers a wide range of territory and demand, and amounts to a considerable aggregate. Orders are received from Maine to Florida, and the dealers here seldom fail to respond with what is wanted. The demand in Pennsylvania, the two Virginias and Maryland, can be called heavy at certain seasons of the year, and is underestimated by the majority when considering the Chicago yard trade. One of the Twenty-second street houses lately filled an order for Portland, Me., and one for Cedar Keys, Fla. In the Portland bill was white pine piece stuff and cull fencing; the Florida order called for oak lumber. The reason why there is this widespread call on Chicago stocks is because it is known everywhere that an order sent here will be promptly filled. A man wanting a car load of specials finds it more convenient to order from a point where he knows the order will be attended to at once and filled than to try a near-by place, perhaps, at which he is satisfied that but a part of his bill can be made up, and probably with unsatisfactory lumber at that. While it is conceded by many dealers that the trade of this city may hereafter be reduced in volume by reason of a decline in the white pine supply and the competition of northern districts, it is claimed, and with reason, that this will remain a great market for well assorted and fine lumber as long as the accessible forests yield up their wealth of raw material. The position with reference to lake and rail transportation insures such a continuance.

The talk about prices is still strong. There is no reason why dry piece stuff, fencing, 12-inch boards, and good atrips should sell for anything but firm prices. Values for the next 60 days will be more or less effected by the weather conditions, but dealers should not get "rattled" because of dull trade during the winter. If the winter is unfavorable to shipments, and there is consequent delay about putting in spring stocks, it will only result in a greater rush later on, which would be favorable to stiff prices. Time flies fast, and a little patience, with a firm hold on values, will bring the trade through the winter in fine form But an attempt to force business out of season, and against adverse weather conditions, can only result in a weakening of values.

There is something of a breeze among the sash, door, and blind manufacturers about a shortness in the supply of thick lumber that enters their operations. It is said that the supply at Oskosh is meagre, and that buyers in Wisconsin are active in picking up lots at mill points throughout the state. This feature of demand may have some significance to the holders of thick lumber in the yards of this city.

LONDON.

The *Timber* of Jan 16th says:—Flooring holds the chief place in the import list for the past week, although the arrivals altogether are within narrow compass and the reverse of important. In the Quebec sheds will be piled the two Fredrikstadt cargoes per Biscaya and Franz, the former of which contains some saleable lines of good quality yellow flooring of Pettersen's shipment. The Millwall docks receive several consignments of yellow and white flooring by the Gothenburg and Christiania liners to the extent of about 50 000 pieces The St. Hilda just discharged in the Russian yard, brings a miscellaneous cargo of Hhlmstadt deals and battens of the HB brand while, to complete the list, a Drontheim cargo (the Victoria) of 260 standards destined for the Centre yard reports for Messrs Bryants' Limited. The importation, although not heavy, is about an average for this period of the year, but we hear that several cargoes of flooring,

from Fredrikstadt and elsewhere, may be shortly expected to supplement our present stock in the quarters where it is weakest.

The almost impassable state of the roads, consequent upon the recent heavy fall of snow and the succeeding frosts, has seriously affected the returns made by the Surrey Commercial Dock Co. of the deliveries for last week, as the following comparative statement clearly shows:

	1886.	1885.	1884.
Deals, etc. (stds).....	1,409	2,549	3,383
Flooring "	246	498	532
Timber (loads).....	605	719	1,500

Messrs. Churchill & Sim's three days' auction has been the event of the week. Each day has gathered a large assemblage of buyers, all of whom were evidently deeply interested in watching the result of this "trial" auction. The room, although seldom crowded, was always full, and seats near the front were not easy to get at any time during the course of the sale. The catalogue itself, comprising several lots of almost every description of deals and flooring, was peculiarly suited to test the range of values likely to hold during the spring, at least, of 1886.

So far as an improvement in prices is concerned, those who hoped for better things, it seems, have had to bear another disappointment. To look at this week's catalogue, and then back to those dealt with at the end of November, enables us to arrive at no other conclusion than that the market has been virtually unaffected by the enforced repose which everyone thought would be of such benefit to it. In the prices now under consideration we discover the least possible variation from the figures current in November; indeed, we may forget the break there has been in the auctions, and continue to trace the tendencies then observable as though we were taking up the thread of the discourse at only a week's, instead of a month's, interval. Battens and common deals are as weak as they ever were, while flooring in third quality shows a tendency to improvement that is not shared by seconds. There is, however, this gratifying feature about the figures made for best quality goods of all sorts, that a fairly good standard was uniformly made, as there were plenty of buyers for all that was offered. Flooring, as a general rule, commanded the best results.

The most important lines in the auction were the various Petersburg stocks, of which the bulk were battens. Archangel found fair favor Next in importance to the Petersburgs, come the shipments from the Finnish ports, which again comprise a long string of batten sizes. These may be dismissed with the remark that 7 in. and 8 in. fluctuated between £6, £6 5s., and £6 10s., with other sizes in proportion.

Variety is essentially the crowning feature of the Swedish stocks, and in the prices realized we have grounds partly for satisfaction and partly for regret, although unfortunately the latter is likely to be the predominating feeling. Fifth deals were apparently in sufficient request to save the price falling below £6 15s., at which a variety of marks found ready buyers. This, in itself, may not be much to say, but it is so far satisfactory in that, as will be remembered, not a few lots of this description were sold as low as £6 5s. in the December autions.

Spruce, pine and red pine were offered in larger quantities than usual, and with satisfactory results. Third Saguenay spruce, 3x9 in. 12 feets, at £6 15s., 11 feets at £6 10s and ends at £6 5s, show a much better result than do most of the Baltic white deals with which, to a great extent, it comes into competition. Third regular pine planks, Saguenay, at £8 15s., reads much like the autumn price; only we should have thought the present partial scarcity would have tempted buyers to pay a little more now that the supplies are closed against them for some time to come. The red pine deals submitted were chiefly in the lower qualities, and for them £6 10s was a fair value. We have seen many better parcels also than the Quebec firsts, of which the plank made £11 15s. The pitch pine deals, ex Telefoi, fetched some wretched prices, although the circumstance that they were a stowage lot and of very undesirable specification is accountable for a good deal.

A good result attended the sale of Oddessa oak boards, and also of the Fredrikstadt slating battens, in both cases a fair advance being established on last prices. Quebec birch, 16 inch to 18 inch, made 67s 6d, which seems to show that notwithstanding the recent heavy import, buyers are not deterred from paying a good price for fair quality wood.

Flooring, as we have remarked, has the reputation of being the best sold. The freshly imported cargo per Pickwick excited a keen competition, which is attributed as well to its fine condition as to the suitability of the dimensions to the requirements of the market at the present time. The few 3rds that were offered realized prices which confirm us in believing that this quality is to enjoy a slight temporary scarcity, accompanied by a good demand. One of the best pieces of the day was that made for the ⅞x7 inch 3rd yellow ex Pickwick, and although 7s for this lot may savor of a lucky chance, it shows at least an anxiety to possess the lot on the part of many buyers present. Third ¾x7 inch yellow matching—that old offender—was stimulated in one instance to an advance of 6d per square, after which ⅝ inch matching was quick to follow suit. Narrow matching, in some cases, improved slightly, but we do not lay much stress on this fact. Inch white went exceedingly well, 1sts making 8s 9d and 2nds 7s 9d, the latter figure being also secured by a lot of DDD. Almost all 1st yellow flooring and matching commanded good figures, and this not only in 7 inch but as well in 6 inch and 5½ inch, which is more unusual. For the 1st ⅞x7 inch and ¾x7 inch, t g.b, ex Pickwick, 8s was made, while the 1¼ inch scored 13s 3d, and the 1 inch 10s 3d. In inch 2nds, although 7 inch and 6½ (of which there were some good lines in the Pickwick) fell flat at 8s and 3d, there is ample cause for satisfaction that 1x6 inch AHA should secure 8s 3d. A precisely similar remark obtains in the case of the ⅞ inch 2nd yellow, 6s 9d for 6 inch and 6s 6d for 5½ inch being much more inspiriting than 7s and 7s 3d for 7 inch. In white ⅞ inch, although there are only a few lots to judge by, prices are also firm when 1st Christiania 6½ inch can make 7s and 2nd 6 inch as much as 6s 3d and 5s 6d. The last named is an excellent price, and falls also the cargo ex Pickwick. From the various odd lots of flooring submitted we select the 1x7 inch EA & Co. 3rd Dram. from 6s 6d as evidence of the improvement in 3rd quality, and the JD & Co ¾x6 inch yellow flooring at 7s, with the ⅝x7 inch white matching at 5s 9d, as instances of really good prices. The Kjorbreek 1¼x6½ inch yellow also shows a considerable advance on the last price made.

WINNIPEG.

The *Commercial* says:—There is no improvement to note in this branch. Trade still hold's in about the same inactive state as during the previous week, and no immediate improvement is considered likely for at least a few weeks to come, or anything like activity until a near approach to the time when building operations can again be resumed.

WOOD-WORKING PATENTS.

The following list of patents relating to the wood-working interests, granted by the United States Patent Office, January 12th, 1886, is specially reported by Franklyn H. Hough, solicitor of American and Foreign patents, 925 F. Street, N. W., Washingston, D. C.

334,330—Log turner—H. T. Basim, Decaturville, Ohio.

334,324—Plane—J. Woods, Columbia, Tenn.

334,175—Saw guide, band—W. Kratzer, Allentown, Pa.

334,285—Saw mill feed mechanism—T. J. Reamy, Nashville, Tenn.

334,284—Saw mill head block—T. J. Reamy, Nashville, Tenn.

334,241—Saw tooth, insertible—A. Krieter, Columbus, Ohio.

334,303—Saw tooth, insertible—J. S. Swank & W. Dages, Big Tres, Cal.

334,297—Sawing machine—D. W. Smith, Long Lake, Mich.

334,141—Sawing machine, circular—J. F. Welsh, Brooklyn, N. Y.

PATENTS ISSUED JAN. 19.

334,538—Lathe—W. J. Muncaster, Cumberland, Maryland.

334,567—Saw—G. N. Clemson, Middletown, N. Y.

334,664—Saw mill feed carriage—G. M. Hinkley, Milwaukee, Wis.

334,730—Saws, machine for jointing and dressing circular—C. Scoch, Truckee, Cal.

334,663—Sawing machine—G. M. Hinkley, Milwaukee, Wis.

334,674—Sawing machine—S. P. Dresser, Pleasant Mount, Mo.

PATENTL ISSUED JAN. 26.

334,893—Chuck, lathe—E. Pement, Esmond, Dakota.

334 997—Edger, gang—S. S. Vall & J. Solliday, St. Louis, Mo.

335,090—Hoop pole sawing machine—E. Powell, Williamsport, Pa.

335 000—Hoop splitting machine—H. Weitzel, Ithaca, Wis.

334 940—Lumber drier—G. H. Derby, Somerville, Mass.

334,943—Plane—A. Doll, Lena, Ill.

334,818—Saw guide, band—S. Stephens & D. B. Handson, Indianapolis, Ind.

334 785—Saw mill, band—E Benjamin, South Evanston, Ill.

334,515—Saw mill dog—J. B. Davis, Munroeville, Ind.

THE Saginaw *Courier* scribe met a prominent lumberman of Ohio in that city last week and asked of the outlook for the lumber business, and was told that a rather better trade than was had last year was expected. The gentleman said in some parts the business had not been very satisfactory, especially in Ohio where the small yards had made but little during the past year. He said they were not stocking up much yet, that in fact the heavy dealers in Cleveland and Toledo were not making an effort to sell as the believed prices must advance.

WANT A LUMBER EXCHANGE.

Agitation for the establishment of a lumber exchange in New York city is going forward. The *Times* notes the movement as follows:—

"One hundred and fifty firms carry on the lumber business in New York, and one of them estimates the amount of capital invested at more than $10,000,000. The persons who compose these firms are in the aggregate worth much more than three times this sum, and if the real lumber market of New York is not so large as Chicago's there is more wealth back of it. For years the New York lumber dealers have tried in vain to establish an exchange. The reason an exchange is desired by them is that by surveying and classifying a system of proper prices may be put upon lumber. Such a system of prices has been adopted in all the principal lumber markets of America except New York, where inspection is not standard, but private, each firm employing its own agent. The lumbermen who want an exchange contend that with its influence for good a set of regulations alike just to the men in the south, west, and northwest as well as to the New York dealer to whom he sells, will be taken up and stood by. They want, as one of them said yesterday, 'regulations which will assure an inspection return properly verified, that it will carry with it evidence of the value of material needed at home and the certificates of both value and integrity that is needed abroad. As it is, however, all lumber depends absolutely on the inspector. If mistakes are made, there are some of the New York dealers who wish for a proper exchange to deal justice all around.'

"The eastern editors of the *Northwestern Lumberman* published at Chicago, say that not a week passes that complaints are not received from shippers of hardwood to the New York market. 'There is no head or tail to the lumber inspection here,' they say, 'and it is this lack of open and authorized inspection that is bringing the New York market into bad repute among mill men all over the country.' The element of the trade which opposes the exchange does so, it is asserted, on the ground that it is not necessary to the needs of the trade, and that, so far as the system of inspection is concerned, the reputation of the firm to which lumber is shipped should be sufficient authority for the honesty of its inspection. The committee which had the matter in charge yesterday adopted a constitution and by-laws. The Legislature will be asked to authorize lawful inspectors."

MANAGEMENT OF BOILER FIRES.

The Hartford Steam Boiler Inspection & Insurance company's bulletin has a timely and instructive artice, which exhibits in a striking manner the serious results which may follow the use of very good feed water when a strong course of practice is followed in the management. The facts are as follows:—

Five new boilers all burned and bagged inside of three weeks after they were first started up. The water used was of very good quality making but little scale or sediment, and the the accidents were due entirely to the manner in which the fires were managed. The burns all occurred within a few inches of the front heads of the boilers, and all occurred at the same hour of the day, although on different days.

It was customary to bank the fires at noon, or rather to fill the furnace full of soft coal, and have the fire door open instead of closing the damper partially, to check the formation of steam. This allowed a current of cold air to enter above the fuel and impinge on the fire sheet. This, of course, would check the circulation, and what little sediment the water held in suspension, and which would circulate with the water as long as steam being rapidly generated, would naturally be deposited on the bottom of the boiler near the front end.

Upon starting the works at one o'clock, it was the practice to run a slice bar through the thick layer of coal put on an hour or so before, and which had in the meantime become thoroughly coked, and break it up thoroughly, then close the fire door. This intense heat thus suddenly applied to the boiler burned the sediment on to the fire sheets before a brisk circulation of the water could be established, which would have gradually picked it up and prevented any damage. But after it was once baked on the shell it could not be removed by the circulating water and the over-heating, bagging, and burning of the iron followed naturally in a short time.

The bag, or pocket, shown in the illustration is about four inches deep, 15 inches broad at the base, and at the lowest point the iron is thoroughly burned out. The thickness of the layer of sediment on the interior is only about 1-16 of an inch. Upon careful examination by the company's inspector, a change in practice was made, and no further trouble has occurred for several years.

Another similar case occurred at about the same time in another locality, where, in a battery of 14 boilers, three of them "came down" at once. This latter case was due to the peculia method of "baking" the fires, and was stopped, as was the first one, by a change in practice.

Too much care can not be exercised in cases similar to the above in the method of firing the boilers. Fires should be started and steam raised gradually, that circulation may be established in a proper manner. This will not only prevent such accidents as have been described, but will also prevent undue strains on different portions of the shells, due to the differences of temperature. Many boilers have undoubtedly been ruined by injudicious firing, and the fault attributed to some defect in the boiler, when in reality none existed.

MOUNTAIN MAHOGANY

In Nevada there is a peculiar wood known as mountain mahogany. The tree does not grow large. A tree with a trunk a foot in diameter is much above the average. When dry the wood is about as hard as boxwood, and being of a very fine grain might no doubt be used for the same purpose. It is of a rich, red color, and very heavy. When well seasoned it would be a fine material for the wood-carver. In the early days it was used in making boxes for for shafting, and in a few instances for shoes and dies in quartz battery. Used a fuel it creates intense heat. It burns with a blaze as long as ordinary wood would last, and then is found (almost unchanged in form) convert to a charcoal that lasts about twice as long as ordinary wood. For fuel it stands much higher than any other kind of wood; indeed, a cord of it always brings the same price as a ton of coal. The only objection to it as a fuel is that it creates such an intense heat as to burn out stoves more rapidly than coal, however bad.

SUBSCRIPTION

FOR THE

Canada Lumberman

IT WILL PAY YOU, BECAUSE :

1. It is the only newspaper published in the Dominion of Canada devoted to the lumber and timber industries.
2. It is devoted to the development and utilization of our forest wealth.
3. It furnishes complete and reliable quotations of prices of lumber in all the leading markets.
4. Its columns are filled with interesting reading matter, valuable alike to the land owner, manufacturer or dealer.
5. It costs only $2.00 per year to have it sent, post-paid, to any address in Canada, and no land owner, lumber dealer, manufacturer or individual in any way connected with timber industries, can afford to do without it.

☞TO ADVERTISERS.

It has a circulation among saw mill owners, manufacturers, lumber and timber dealers and all classes connected with the timber business.

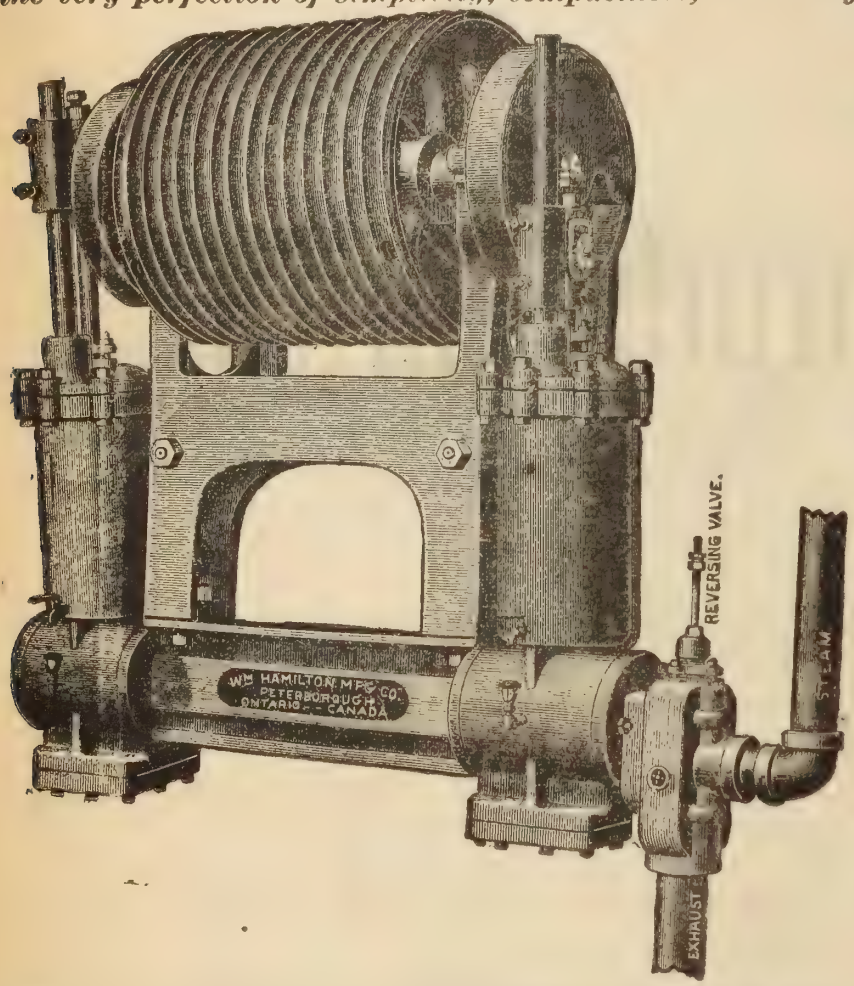
Examine the field, count the cost, and you will at last decide that the CANADA LUMBERMAN is the

———CHEAPEST, BEST, MOST RELIABLE and ONLY TRUE MEDIUM———

for placing your goods or wares before the saw-mill men and lumber and timber dealers of the Dominion.

CUNNINGHAM'S
PATENT OSCILLATING TWIN ENGINE
FOR STAM FED IN CIRCULAR MILLS WITH RACK OR ROPE.

This Engine has practically but two moving parts, aside from cranks and shafts. The whole array of eccentrics, valves, valve rods, connecting rods, cross heads, slides, levers, rock shafts, bell cranks, etc., is done away with, and the very perfection of simplicity, compactness, durability and cheapness attained.



The above engraving illustrates the Twin Engine, 10x16, for Rope Feed, for Saw Mill Carriages. The spool is 27 in. diameter, 30 in. face, is grooved 2 in. pitch for 1½ in. rope. The shaft is steel, 4½ in. diameter, with disk cranks. No connecting rods, eccentrics or valve rods to get loose and out of order. The ports are in the trunions, and worked by an oscilliation of the cylinders, and are held in their place in the downward motion by a steam cushion below. The sawyer's valve is a perfect balance, and by moving this valve the engine can be reversed, stopped or started almost instantaneously if necessary, as the sawyer has perfect control of it by his lever either to go fast or slow. Should the sawyer let go of his lever either by mistake or any other cause, it is balanced so that the valve will come to the centre and cut the steam off both cylinders and stop the feed. When standing, the lever is locked or fastended, so that is is impossible for it to start off itself. The engine stands upright below the carriage, and bolted to two upright beams, placed on the mill for the purpose. When a rack is preferred in place of the rope, we put on a steel wheel 30 in. in diameter, and the engine placed high enough to work into the rack on carriage bar, or if the beams come in the way, an idler wheel can be used between engine and rack segs; or, the engine can be placed at a distance and have a shaft from it to the carriage; or it can be placed in the engine room, where it is under the control of the engineer for oiling, thence by shaft and pinion to carriage rack bars. These engines are well adapted for cutting long logs, or where the logs are mixed, the advantage of this feed will be apparent to mill men. When the carriages are used in two or more sections, the coupling and uncoup ling of each section is quick and simple.

There were two of these feeds working this summer and giving the best of satisfaction, one with rope feed at James Playfair & Co's Mill, Sturgeon Bay, near Waubaushene, and one at the new mill furnished by us to Francis Carswell & Co., at Calabogie Lake, on the Kingston and Pembroke R. R. This mill is working with the Rack and Pinion feed, and drops from fifteen to seventeen stock boards per minute. We have also sent one to the Rathbun Company, Deseronto, to put in to feed their heavy Circular Mills. They will also commend themselves for various other cases, especially for running Elevators, hoisting Engines, and wherever a simple and easily reversible motion is required.

We would also call attention to our Improved Hand Saw-Mill for cutting logs

☞ ***We guarantee this to be the best Mill of its kind got up, and would ask any one wanting a good Band Saw-Mill to communicate with us. We would also call the attention of Mill Men to our new IRON GANGS, CIRCULAR MILLS and MILL MACHINERY. For further information, prices, &c., address the Manufacturers,***

VOL. 6. PETERBOROUGH, ONT., FEBRUARY 15, 1886. NO. 4.

MR. JOLY ON THE TIMBER TRADE.

SIR,—President Cleveland's recommendation, in his message for the abolition of the import duty on Canadian lumber, appears to meet with a good deal of favor from the Canadian lumbermen. It would benefit them to a certain extent, but not likely to the whole amount of the duty of two dollars per thousand feet. On the other side, if it leads to our allowing the American lumbermen to cut down our forests and manufacture the product thereof in their own country, the result will be fatal to the Canadian lumberman as well as to the country at large.

The Dominion would be much more benefited by the imposition by our own Parliament of a heavy duty on the export of logs to the United States, than by the abolition of the import duty on our sawn lumber into the States.

A heavy export duty on logs would prevent the cutting down of our forests by the American lumbermen, and it would secure work for our people and keep them here. It appears little short of madness, when we have got the raw material here and thousands of willing men to work it, that we should send away to our neighbors both the raw material and the men who can work it here. It is a suicidal policy, and it would be difficult to find a parallel for it in any other country.

The fact is that our timber trade does not rest on a sound basis. If we could arrive at a correct balance of that trade for the last twenty-five years, it would be sad to find out how little we have received for the value of our timber above our expenditure in manufacturing it. In more than one case I fear that we have actually paid the purchasers on the other side to accept our timber from us.

The responsibility of this stateof things must rest, above all, with our Provincial governments. They are the administrators of our timber lands. Instead of treasuring them and opening them only gradually to the lumbermen, as the legitimate requirements of the timber trade demand, they force them, wholesale, on the market and actually compel an extravagant production, which can only have one result: glutting the market and ruining the lumberman.

How many men are they not among us, who understand absolutely nothing of the lumber trade, who had never given even one thought to it, and who, at a moment's notice, have been actually manufactured into lumbermen by the action of Provincial Government?

I stated that our timber trade did not rest on a sound basis; let me quote no less an authority than John Stewart Mill on the subject. In his first volume on the Principles of Political Economy, chap. 15, "of profits," he says:—"The timber trade of Canada is one example of an employment of capital, partaking so much of the nature of a lottery as to make it an accredited opinion that, taking the adventurers in the aggregate, there is more money lost by the trade than gained by it; in other words, that the average rate of profit is less than nothing."

This was written long ago, but it applies now, more than ever, to our timber trade.

It is not often that Governments can interfere, beneficially, with trade; but they can in the present case and it is full time that they should do so.

H. G. JOLY.

Leclerville, P. Q., January, 1886.

LUMBER DUTIES.

THE Port Arthur Board of trade is not satisfied with the present duty on lumber imported from the United States, and wish it re-arranged so that the duty will not be so high per M. on the lower grades. The Board of Trade, at a recent meeting, embodied their views in the following resolution:—

"That whereas it appears that provision is made in paragraph 6 of chap. 15 of 42 Vic. for a reduction of the duty on lumber imported from the United States, in case it should appear to the satisfaction of the Governor-in-Council that lumber may be imported into the United States from Canada at a less rate of duty than that imposed on lumber coming from the States to Canada under the provisions of the act referred to.

"And whereas the United States Government imposes a specific duty of $2.00 per 1,000 feet, board measure, upon pine lumber not planed or finished, without regard to its quality or value, but that lumber imported from the United States to Canada is taxed 20 per cent. upon its value, thus admitting common lumber, which competes with our domestic products, at a low rate, but putting a prohibitory tariff upon the better quality of pine which is not produced here.

"And whereas it appears that most of the imports of lumber into Canada are for consumption in Manitoba and the Northwest, and that is lagely of the expensive qualities required for the manufacture of many staple articles of family and home benefits for which the domestic lumber is not suitable.

"And whereas the effect of an ad valorem duty on lumber is largely to increase the cost of the better goods not produced here, and prohibiting the import of such lumber except in the finished state of sash, doors, etc., so that manufacturers in this part of Canada, who are dependent on such lumber, are unable to prosecute this industry owing to the high cost of the raw material under our tariff, which is in its effect largely in excess of that imposed by the United States on lumber of corresponding value going from Canada.

"It is therefore resolved, that the attention of the Dominion Government be called to the matter, as it seriously affects an important industry, which would, if enabled to obtain its raw material at reasonable cost, prove of great general benefit, and that the equalization of the tariff on lumber would have the effect desired, that it would injure no Canadian industry but would cause a considerable reduction in the cost to the consumer of staple articles required in the Northwest, which are now largely imported from the United States, and that the reduction of revenue to the Government would be slight in comparison with the general advantage to the country."

CHICAGO LUMBER MOVEMENT.

Glancing over the last monthly statistical sheet, issued by the Chicago Lumberman's Exchange, several prominent facts are presented. One is that there was, on January 1st, but 2,782,376 feet of lumber in the yards more than there was at a corresponding date last year, but there is shown an increase of 95,000,000 shingles.

It is interesting to note the course of trade throughout the year, as indicated by the stocks on hand at the beginning of each month. It is peculiarly interesting to the *Lumberman's* market reviewer, and should be to close readers of the paper, on account of the remarkable coincidence between the exchange figures and the movement of lumber as set forth in our reports from week to week. The monthly reports of stock on hand, as returned by the dealers to the secretary of the exchange, are probably the most relieble figures concerning lumber published in the Northwest.

It has been repeatedly asserted that the trade of this city lost a good start in the year's business of 1885 by the excessively cold weather and heavy snow storms of January and February. The figures corroborate this assertion. In January, 1884, 67,007,509 feet of lumber was sold out of the yards, and 125,772,587 feet in February, about 193,000,000 in both months. In January last year the sales and shipments in both months amounted to but little over 96,000,000, less than one-half of that during the corresponding months in 1885. So it will be seen, that as compared to the year previous, the trade on March the first, 1885, was fully 100,000,000 feet of lumber behind. But in March last year there was a heavy outward movement, amounting to 142,394,333 feet, as compared to 127,922,991 in March, 1884. In April of last year trade fell back as compared to April of 1884, the difference being represented by 136,126,975 feet in 1885 to 166,329,243 in 1884.

So it will be seen that last year, up to May 1, there had been three poor months for trade, and one good one—March. On May 1st the yards contained nearly 50,000,000 feet more lumber than they did at a corresponding date in 1884.

There was another start made in May, sales and shipments during that month amounting to 179,173,517 feet as compared to 178,170,870 in May, 1884. Hence it will be seen that the statement then made that trade was in excess of that of the corresponding time the year before was correct. The trade of June was also a little in excess of a like month a year before, as it likewise was in July. But in August distribution fell behind that of the corresponding month of 1884. In September trade forged ahead again, and beat the previous year's record by nearly 90,000,000 feet. Trade in October of last year was also a little in excess of that of the previous year. But in November there was a serious drop-off, there having been sold and shipped in November, 1884, 208,700,000 feet, while last year there was but 170,102,695 disposed of. This difference in favor of 1884 was wholly owing to the fact that there was a southwestern freight rate of only five cents a hundred, while in November, 1885, there was none. Yet there was twice as much lumber sold in December of last year as there was in a corresponding month of 1884.

It is well to observe how the totals for the two years look when sized up together. In 1884, sales and shipments amounted to 1,789,031,939 feet, and in 1885, 1,711,443,112—only about 77,500,000 less in 1885 than in 1884. This falling off last year was more than accounted for by the loss of trade on account of the extraordinary cold weather in January and February of last year.

We have thus thrashed over the old straw, as it were, to show how accurately the *Lumberman* as it went along, has indicated the state of trade, and how utterly without reason is the complaint that the distribution of the past year was greatly less than it was in 1884. As a matter of fact distribution in March, May, June, July, September and October and December was heavier than in the corresponding months of 1884, though in January, February, April, August and November it was lighter. The difference in the volume of trade as compared with the corresponding months of the two years was more owing to weather and freight rate causes than anything else, conditions hat might be reversed in other years. There s nothing in the exhibit of the year's business that certainly points to a decay of the Chicago lumber trade. Prosperous times, or favorable circumstances affecting freight rates and competition may swell the white pine business of this city in some year to come beyond what has as yet been witnessed.—*Northwestern Lumberman.*

ICICLES are such a scarcity at Beaumont, Texas, that during the last cold snap a large one, that hung on the Texas Tram & Lumber Company's water tank, was so admired that the company thought of having it photographed.

THE TRADE.

The lumber trade in Ontario is rather quieter at present, and the prices steadier than was predicted by dealers who profess to forsee an excited rush for lumber and a general advance in prices early this year. True, there has been a decided demand for good dry pine, and that demand continues, with the supply of it almost everywhere short. But what else can be expected when everyone runs after first-class seasoned pine, and the supply cannot be maintained? It is vain to offer to our builders spruce for flooring, hemlock and tamarac for bill stuff. Our extravagant contractors, five times out of six, will have nothing but pine, and until they plant more forests, or bring nearer those already existing, they will probably continue to find dry pine scarce and high.

There is no advance in price of lower grade pine, and though the tendency is upward there is no quotable change in figures for clear and pickings from those we last gave. But joists, scantling, sidings, &c., are held higher in this market. Certain lines, even in the new cut, are pretty sure to maintain their prices. In Albany, good pine is by no means plentiful; recent purchases have been made at Collins' Inlet, Georgian Bay, we understand, by parties from that city, and negotiations are in progress for other large transactions on the bay. The prospect of free admission of Canadian lumber to the United States market appears no brighter than before, but for all that the American demand for our choice pine is quite likely to be maintained.

As to other varieties than pine, we find that hemlock is coming into use here and there in Ontario, where builders perceive that we cannot use pine forever. Tamarac is occasionally used for sills and joisting. It is about equal in price to spruce, which, though not yet used in this district, except for flooring, is largely exported from the lower St. Lawrence to the Eastern States as well as across the ocean. We, in Canada, as well as our American neighbors, have yet to learn the meaning of economy in the use of timber and lumber, as well as in other important respects.—*Monetary Times.*

NEW BRUNSWICK STUMPAGE.

WHILE some Provincial Governments are being charged with wastefulness in disposing of the timber of the country, the Government of New Brunswick is coming in for severe criticism of an opposite character. If the idea of that administration is to preserve its timber until after its sister Provinces are depleted of theirs, the retention of the stumpage charge of $1.25 per M feet would appear to be a pretty effectual way of doing so; but if the high charge is retained only for revenue purposes it looks very much like a suicidal policy.

The lumbermen of New Brunswick cannot be expected to compete with the men in the same business in Nova Scotia and Quebec, when in New Brunswick the stumpage is $1.25, against only 60 and 40 cents in the other Provinces. An excessive charge in a time of depression in business, and the placing of its lumbermen at a disadvantage as compared with the lumbermen in other Provinces, is a sure way to discourage trade and to decrease the revenue, if it does conserve the forests. In fact, the maintaining of such a charge for stumpage can scarcely fail to result in driving the lumbering business out of the Province.

The conservation of the forests is worthy of the Governments in Canada, but it can be attained by other means than the complete stifling of the lumbering business. This question evidently needs the careful consideration of the New Brunswick authorities.

LANCE wood, says an exchange, gets a lift from the toboggan sports. The best comes from Cuba in 14-foot spars from four to eighteen inches thick, and used to be worth $1 to $3 a spar, but now, within a month, $2 to $5 is paid, and not so good a selection on hand as is desirable This wood has been confined for service to dog-cart shafts and fishing rods. It must be freshly imported as needed, else by storage it "dots" or becomes blue. It had favor in the archery days of 1881, but no such advance in prices as toboggan secured.

AN INGENIOUS PAVING BLOCK.

A. T. Elford, of San Francisco, Cal., is the patentee of an improved paving block, which is designed to insure a permanent pavement, adapted to all kinds of weather, and to furnish superior advantages for laying telegraph wires or cables. The following directions give a general idea of the process of paving.

The blocks are cut about four inches thick, eight inches wide, and ten inches long, of any suitable timber of wood. The holes are made from two to two and one-half inches in diameter, according to the nature of the timber employed. The blocks are laid closely together and when wet, on sand or any suitable bedding, such as is employed for other pavements. The top is then coated with asphaltum and sand, or other suitable material, such as is already in use for coating wood to render it more durable and capable of resisting the action of the weather.

When laid, it will be seen that the perforations are in a direct line and form a continuous passage. These passages form an excellent receptacle for telegraph wires or cables, allowing them to be laid along or across the street at any part, thus entirely avoiding the necessity of erecting telegraph poles, which are very objectionable in the principal streets of cities. The common paving block retains the moisture in the whole block, and, when shrinking and swelling, is often thrown up and out of place as the weather alternates from wet to dry.

For the purpose of laying telegraph wires where the street is not so paved, the sidewalk can be paved with the same kind of blocks and the wires run along through the same.

WOODS FOR EXHIBITION.

A Quebec despatch says:—Messrs. R. R. Dobell and Co., and John Burstall and Co., have presented the Dominion Government with some very fine specimens of wood goods, selected from their respective stocks, for the Colonial Exhibition, London, consisting of sixteen pieces of timber of the following varities: Black walnut, chesnut, maple, oak, black ash, rock elm, white pine, red pine, shell bark hickory, white wood, bass wood and white oak; also deals, staves, etc. Some of the white pine deals by Burstall and Co. are of extraordinary size. The above specimens are valued at some hundreds of dollars, and will, no doubt, attract considerable notice when placed on exhibition.

BOBCAYGEON.

TIMBER.—The production of logs this year will be larger than last year. Mr. Boyd's limits along the Monk Road will be very productive, and yield a large drive of logs for Little Bob mill, whilst Mr. Petrie, for his mill, has bought more logs than he ever before had on hand, and not quite as many as he can cut in the season. There is but small demand for hard wood, bass wood is in fair request, and elm for furniture is increasing in demand. The prospects altogether are better now than they have been for years.—*Independent.*

AN Ottawa despatch says:—The lumber trade for 1886 is opening under most auspicious circumstances, in fact the outlook has not been so good for years as it is at present. There are more sales now made and at better prices than have been obtained in the previous history of the lumber industry. A happy feature, and one which shows the healthy condition of trade, is that these sales are not confined to any particular grade of lumber. The sales this years are for the whole cut of the log, that is shipping culls and better. One American firm alone have purchased one hundred million feet at a cost of about $1,600,000, and there are other sales now made which will unquestionably bring the amount of lumber of next season's cut now sold to over $4 500,000. The cut for 1886 will be unusually large. and the output, taking from Arnprior to Hawkesbury, will be about 600,000,000 feet, the value of which amounts to a little over $8,000,000.

SHILOH'S VITALIZER is what you need or Constipation, Loss of Appetite, Dizziness and all symptoms of Dyspepsia. Price 10 and 75 cents per bottle. For sale by Ormond & Walsh druggists, Peterborough.

BOILER TREATMENT.

To the Editor of the Canada Lumberman.

DEAR SIR,—As my attention has been called at different times, by my employers and others, to articles on lubricants for steam cylinders and compounds for the removal of scales in steam boilers, etc. Upon the latter subject I will give the ingredients of a compound that I am using, and have used for some time. And as I have used a goodly number of boiler compounds, among others Lords, which has such a great reputation, and I have never found anything to equal the one I shall give, which is the cheapest, and I believe the best, boiler compound in the market. The ingredients are as follows: 1st, never blow off your boiler under pressure; 2nd, let the water remain in the boiler just as long as time will permit before cleaning; 3rd, enter your boiler at each cleaning, carefully examining every part, and remain inside while washing out to see that every particle of mud has been warhed out, as there will be nothing but mud if the boilers are left to cool down before letting out the water. I have in my possession some of the largest scales I ever saw come out of a boiler, and this simple compound is just what removed them. Of course, some will say, "Oh well, there is lots of difference in the water," and just so, there is, but I am running three large tubular boilers, taking water from the Nation river, of which the bed is solid limestone, and the heater I am using is of the surface type, so that everything that is in the water passes direct into the boilers, and these boilers are the ones I took the large scales from both from the shell and tubes, which collected in six months time, and no other compound was used but the simple one mentioned. Two years ago I took charge of a battery of five large boilers, and found them badly scaled, I applied the same compound with the best results, as I have many other boilers, and always use it to prevent scales from collecting. Now this collecting of scales in steam boilers is but one of the many destructive and most dangerous results of blowing out under heavy steam pressure. But this all I will write on this subject this time, but if permitted to express my opinion through the columns of the LUMBERMAN I shall give more of my experience on this impostant subject.

E. D. TOWSLEY.

Casselman, Ont. Feb. 11th, 1886.

TAXATION ON FLOATING LOGS

An interesting supreme court decision has just been given concerning the taxation of logs in the town of Errol, N. H. The case is somewhat as follows:—Parties cutting logs in sections of New Hampshire, intended for market and manufacture in Maine, had landed the same on the banks of the Androscoggin river in Errol. The selectman appraises them for taxation and assessed thereon state, county, town, and school taxes. Another lot of logs, belonging to the same party, which has been cut in the state of Maine, and were on their way to Lewiston for manufacture, were also detained in the town of Errol on account of low water. These were also assessed for taxes by the selectman. The supreme court now affirms the decision of New Hampshire courts that logs cut in New Hampshire and lying upon the banks, and which had not started on their way or been committed to the common carrier, were liable to taxation in the town of Errol. On the other hand, the court affirms that logs cut in Maine, floating down the river to their destination in Maine, hung up by low water in New Hampshire, were not subject to taxation by the selectman of Errol.

Following is a comparative statement of the lath manufactured by the Saginaw river mills since 1876:

	Pieces.
1876	72,703,660
1877	72,514,990
1878	53,236,075
1879	65,969,000
1880	65,063,883
1881	65,983,750
1882	92 703,800
1883	106,132,703
1884	157,345,000
1885	80,931,400

JOSIAH BEOAS was struck on the thigh by an axe used by J. Smith, near Wellington, Ont., the axe having glanced off a tree. An artery was severed and he bled to death.

THE Australian Colonies, New Zealand, and Fiji Islands, will send specimens of all kinds of native timber to the forthcoming exhibition at South Kensington.

HENRY THIELAU, a farmer, sat down on the box enclosing a buzz-saw, in a planing mill in East St. Louis, on Feb. 10th. The saw suddenly started and Thielau was instantly cut in two.

That troublesome cough should be at once cured, as, if not, it is liable to terminate in consumption. Thousands die annually that might have been saved if West's Cough Syrup had been taken in time. It will positively cure the worst cases of throat and lung diseases, colds, coughs, hoarseness, bronchitis, whooping cough. Price 25 cents, 50 cents and $1 per bottle. Sold by J. D. Tully, druggist.

The World's Best.

It is certainly remarkable the wonderful cures effected by West's World's Wonder or Family Liniment This remedy has not an equal in the world for the speedy cure of Rheumatism, Sprains, Cuts, Bruises and all diseases requiring external application. Price 25 cents and 50 cents per bottle. Sold by J. D. Tully

The Greatest Preparation Yet.

"Eureka," Dorenwend's world renowned Hair Destroyer, destroys all superfluous hair on the face or arms of Ladies or Gentlemen. It is harmless, causes no pain in using, and leaves no disfigurements; can be easily applied, and works quickly and surely. Thousands have used it and pronounce it to be the best article of the kind before the public. To be had from J. D. Tully, Druggist, agent for Peterborough.

AN EXTRAORDINARY OFFER.

To all Wanting Employment.

We want Live, Energetic Agents in every county in the United States and Canada, to sell a patent article of good merit, on its merits. An article having a large sale, paying over 100 per cent profit, having no competition, and on which the agent is protected in the exclusive sale by a deed given for each and every county he may secure from us. With all these advantages to our agents and the fact that it is an article that can be sold to every householder it might not be necessary to make an "extraordinary offer" to secure good agents at once, but we have concluded to make it to show, not only our confidence in the merits of our invention, but in its saleability by any agent that will handle it with energy. Our agents now at work are making from $150 to $600 a month clear and this fact makes it safe for us to make our offer to all who are out of employment. Any agent that will give our business a thirty days' trial and fail to clear at least $100 in this time, above all expenses, can return all goods unsold to us and we will refund the money paid for them. Any agent or general agent who would like ten or more counties and work them through sub-agents for ninety days and fail to clear at least $750 above all expenses, can return goods unsold and get their money back. No other employer of agents ever dared to make such offers, nor would we if we did not know that we have agents now making more than double the amount we guaranteed, and but two sales a day would give a profit of over $.25 a month, and that one of our agents took eighteen orders in one day. Our large descriptive circulars explain our offer more fully, and these we wish to send to every one out of employment who will send us three one cent stamps for postage. Send at once and secure the agency in time for the boom, and go to work on the terms named in our extraordinary offer. We would like to have the address of all the agents, sewing machine solicitors and carpenters in the country, and ask any reader of this paper who reads this offer, to send us at once the name and address of all such they know. Address at once or you will lose the best chance ever offered to those out of employment to make money.

CHICAGO SHINGLE TRADE.

The movement of shingles in the Chicago market during 1885 was something remarkable —not on account of the large comparative amount handled, for much less than 1884, but because it was so disappointing of expectations, and so unevenly distributed through the year. In 1884 the sales and shipments of shingles from the yards of this city reached a total of 1,007,458,385, while in 1885 the total was but 662,240,011 or nearly 400,000,000 less. This comparatively meagre movement of shingles from Chicago yards is another proof of what the *Lumberman* declared throughout 1885, that the strictly rural or farmers' demand for yard stocks was small in proportion to the city demand. Where there is a heavy distribution of lumber into country districts, there is a proportionate large call for shingles. There may be a great consumption of lumber in city building, but since a large majority of urban houses are covered with other roofing material than wood, there are fewer shingles required than in country building.

The Chicago trade in shingles in 1885 started out with sales and shipments of but 1,675,336 in January, and 5,310,500 in February, as compared to 26,787,246 and 82,139,000 in corresponding months of 1884. But in March of last year the demand for shingles took a spurt, and the yards in that month got rid of 116,071,975 as compared to 66,823,747 in March 1984. This exhibit shows again how lively the wholesale yard trade was in March last year, and how it was largely the result of a country demand, which always calls for a greater proportion of shingles than the city trade. But after March the shingle trade last year fell off sadly in comparison with the year previous. In July it amounted to but 3,699,350, while during the same month in 1884 89,116,955 were disposed of. During December, the last month of the year, the amount moved out of the yards was about the same as the year before, namely, 14,246,009.

It is probable that no difference in the prices of shingles caused the relative difference in distribution between the two years. The supply in 1884 crowded the market more than it did in 1885, receipts in the former being 895,528,000, and in the latter 770,727,000. We are forced to the conclusion that the falling off in the shingle trade last year was wholly owing to a relative decline in the strictly rural demand for both lumber and shingles.—*Northwestern Lumberman.*

PRESERVATION OF FORESTS.

The rapid destruction of the forests of New York state, and the consequent droughts in summer and destructive floods in spring, led last spring to the appointment of a forestry commission, whose first report has been presented to the State Legislature. They remark that it has not been possible for them to more than familiarize themselves with their duties, and to acquire knowledge as to the wants and dangers of the forests through the intelligent exertions of special agents under their direction. The Commission ask time to prepare and present a further report, and recommend certain amendments to existing laws, such as the prevention of forest fires, trespassing on forest lands of the state, and the removal of timber, the injury of forests by railroads, and a provision for the conveyance of certain lands now forming part, but it is believed by the Commission erroneously, of the forest preserves. Our neighbors are taking active and practical steps to remedy a serious evil. In Canada we are already brought face to face with a problem of a similar character—how to prevent the rapid destruction of our forests without retarding the settlement of our wild lands. Hitherto the object of the Crown Lands Departments in Ontario and Quebec has been to destroy the forests with all possible speed. No settler could acquire a title to his property without removing from its surface at least ten per cent of the standing timber within a period of two or three years, even though, in its removal, he should find it necessary to burn the forests for miles around. Failure to destroy the timber entails, in the Province of Quebec, confiscation of the property and forfeiture of the amount paid for it, and of all improvements. It may yet dawn on the minds of those who manage the public domain that the forests are not only a source of public wealth, but that they are necessary to protect the country from disastrous floods in spring, and parching droughts in summer.

Lately a disposition has been manifested to exclude parts of the country, which are mainly valuable for their pine forests, from settlement. It has been found, as the result of a painful and costly experience, that to sell a lot in such a district to a settler is to destroy pineries of inestimable value. It has taken a long time to get this idea into the heads of Crown lands officials, but the fact that they have learned a a lesson, even at the price which has been paid for it, gives reason to hope that they, or their successors, may yet realize the importance of preserving our diminished and diminishing forests before they cease to be any left to preserve.—*Ottawa Journal.*

FORESTRY.

The necessity of the preservation of forests is conceded by all civilized nations. So pressing has become the necessity of restricting this waste in other countries that laws have been enacted for that purpose by several of the governments of continental Europe.

The bureau of the forest administration of France reports that the French forests yield an annual surplus of about $3.500,000. It states that France has about 17.3 per cent. of her superficial area in forests. The public or domain forests amount to 10.7 per cent of the forest area. The forests of Algeria are new and undeveloped as yet, and are a charge upon the state to the extent of $300,000, and in spite of this burden the care of the forests clear annually $3,500,000 above expenses; and while securing this handsome revenue France is securing by the maintenance of her forests the best climatic conditions for the health of her people and the success of her agriculture, and is preserving the flow of her streams in a condition serviceable to agriculture, manufacturers and commerce.

Efforts are now being made by prominent naturalists in England to make the forests and woodlands of that country more productive by the establishment of a public forestry school.

The United Kingdom has about 3,000,000 acres of forest and it is estimated that in the colonies belonging to the empire there are no less than 340,000,000 acres of woodland.

So far is this, however, from being generally recognized that there is no place in England where pupils can learn the principles of forest conservation and management, and the officers intended for the Indian Forest Service are sent to the French forest school at Nancy to be instructed, while the public woodlands in Cypress, at the Cape of Good Hope, are intrusted to the care of foreigners, for want of British subjects capable of looking after them.

To show the advantages which would follow the adoption of a better system, Sir John Lubbock, the distinguished naturalist, moved lately in the British House of Commons that a committee be appointed to ascertain whether the forests and woodlands of England could be made more productive of by the establishment of a public school of forestry, such as now exists in nearly every other civilized country. He said that the interests of Great Britain on the subject are really greater than that of any other nation. He cited the example of the Landes, a vast plain on the west coast of France which 30 years ago was a marshy waste, over which a few shepherds, perched on long stilts to keep themselves out of the mud, and drove their poor flocks, but which is now, thanks to Brementier, who took the first step towards its reclamation by planting a few maritime pines along the sand hills which line the shore, one of the most prosperous districts in the Republic, busy with the manufacture of turpentine and timber from more than a hundred thousand acres of recently planted forest, and officially rated as having increased in valuation about $200,000,000 within less than a generation. To this illustration he added one more for the recent history of India, where 15 years ago the annual public revenue from forest property was $110,000.

Soon after that time an Indian Forest Department was established, which provides expert direction for the maintenance and increase of woodland, and the forest revenue has since rapidly increased, amounting now to more than $2,000,000 a year, or about 20 times as much as it was just before the establishment of the Forest Department.

In seconding the motion of Sir John Lubbock, Dr. Lyons remarked that the best authorities now believe that in order to keep a cultivated country in the most productive condition from one-fourth to one-third of its area should be covered with woodland, as a protection; and Mr. Gladstone, whose fancy for wielding an axe is well known, showed his knowledge of the subject by remarking, in answer to a rather personal allusion from one of the speakers, that the judicious felling of trees is necessary to the proper maintenance of a forest; and that nothing tended more to perpetuate the neglected and useless condition which educated foresters observed in English woodland than the superstition of the owners, who looked upon the cutting down of a tree as a sort of sacrilege, instead of the means of developing the saplings about it.—*Exchange.*

CIRCULAR SAWS.

I. T. Landon writes in *Cabinet Making and Upholstering*: We cannot do much sawing until we have got a saw in and set it to work. But I believe we have already done that. The table and arbor and saw are in due position. The saw plate is perfect. The teeth are filed and set, and we are standing with coat off and sleeves rolled up waiting for a job to try and see what we can do. Well, here comes the first job. A very simple one if we knew how to do it. A square stick to be split from corner to corner. Don't set your gauge that tips, to a miter, and fasten on a block to the table to keep it from slipping down, but just measure across with a rule from corner to corner and set your gauge to half the distance allowing for the width of saw kerf. Tip the piece to be sawed up on the corner and bring the other corner up to the guage, so that when you push it up to the saw the saw will cut in the centre of the corner that is up. Hold the stick firmly in that position till the whole length of the stick is sawed and you find the piece very nicely cut from corner to corner. Any number of pieces may be sawed in that way with no more trouble than sawing straight flat work; only you must keep the stuff up so the saw will always cut exactly through the top corner.

The next job that comes along is this: A man has a round tank to build that is smaller at one end than at the other, and the staves all of a size. There are two ways to do this job; but one is better than the other. With either we must saw a pattern. After the pattern is nicely made put the small end up against the gauge and measure off the width of the wide part of the stave between the saw and the pattern, keeping the piece to be sawed up close to the pattern and even at one end or the other, push through steadily and you will find that you will have an exact duplicate pattern. Turn the pattern for every piece you saw and your stuff will come out even. The other way is to lay your pattern on and mark out every piece by it and saw by the lines. This line sawing is a nice job, and there are but very few good line sawyers in the market. Unless the stock is knotty and you are obliged to mark out every piece to save stock, it is much better to saw with the pattern against the gauge. Where there is plenty of carriage sawing you may find good line sawyers, but in ordinary shops the good ones are few and far between.

While speaking of line sawing I will offer a few suggestions about it. Never take a board or a plank up and stand on one side of it if you wish to come anywhere near the line for any distance. Hold the piece to be sawed directly in front of the saw, and when you start in strike the line fair and square in the centre. If you are not much used to sawing, push along the work carefully so you may keep directly on the line. Don't push along heedlesaly and then condemn the saw for spoiling the work, when a little patience and care would have saved both the stock and bad words too. If you saw the first cut well, you will gain confidence; only don't let your confidence lead you into carelessness. With this kind of sawing, especially, there must be care taken till you know just how to do the work well. Then you can go ahead and do it fast. But always be sure you can do it well before you try to rush it. Band sawing is a splendid school for line sawyers and yet there is a difference in sawing to a line with the different kinds of saws.

I ought to have said when speaking of sawing stuff cornerwise, that the same principle might be used in sawing square timber if we did not want to go to the middle. Run a gauge along on two sides of the stick, measure the distance from the corner to the guage line, and set the saw guage just that distance, turn the stick up till the saw cuts the line, which follow closely and the work will come out good every time. Let's go into a place now where they are sawing large circulars like freight car rafters out of good hard oak or ash planks. You will see a lot of heavy planks two inches thick piled up with a circle marked on the edge of each one just the shape of the top of the rafter. They are all sawed to this line and piled up again by the saw bench where a curved guage is kept and used for just this purpose.

After adjusting the gauge a little the planks are pushed through as easily as if they were straight pieces; every one has the right curve and they go directly to the molder to be finished cornered. This is work that might be done on band saw, but if it was done there each rafter would have to be marked out by a pattern; the work can be done faster on a circular saw than with a band saw. There is of course a limit to using the circular saw for cutting carved work, but where the circle is large enough the circular saw does the work quicker and better.

A vast amount of beveled work, as well as cutting stuff at all possible angles, can be done on common wooden top saw benches, if we only have the ingenuity to get up some simple rigs, which, once made, are of great value for jobs that otherwise would be long and tedious. Two grooves in the top of any saw table will put almost any one in the way of doing a great variety of very nice work.

THE LUMBER TRADE.

A shipment of 150 standards of white pine has been made from Ottawa to Liverpool via New York on a through rate of freight of 70s. A Norwegian vessel has been chartered to take on a cargo of lumber and deals at Quebec for London at 20s. lumber, and 50s. deals. The outlook is certainly favorable for a good lumber trade during the coming season, both for export and home consumption. A local dealer stated that he had good reasons for believing that building in Montreal would be fairly active during the present year.

Advices from Duluth report the heaviest transactions in lumber that has taken place there for a long time past, the sale being made by the Carleton Lumber Company to D. H. McEwen, of St. Paul, comprising 1,300,000 feet of lumber to be delivered in St. Paul within a month. Reports from Detroit state that the prospects for the coming season are bright and that operators are very hopeful.—*Trade Bulletin.*

A SILLY SUPERSTITION.

QUEBEC, Jan. 27.—Hector Bouchard, who is imployed in the shanties of Messrs. Price Bros., at St. Etienne, on the Saguenay, was instantly killed on Sunday by the discharging of a gun. It appears that it is the habit of these shantymen to blow in the barrel of a gun, believing, through superstition, that any request they ask will be granted by performing this strange freak, which is enacted by placing a cap on the nipple, and while the performer is in the act of blowing in the muzzle to pull the trigger and fire off the cap. If the performer displays any fear his prayer will not be answered, he being regarded as unfaithful. It was during this performance that the gun, which was loaded, suddenly discharged and the bullet entering Bouchard's mouth and coming out at the back of his head, killed him instantaneously.

THE Grand Rapids Chair Company has bought 3,000,000 feet of maple logs at Kalkaska, Mich., paying $4 a thousand for them.

RISK ABOUT STEAM POWER.

It would hardly seem possible, says the *Manufacturer's Gazette*, when we are told so much about mechanical, social, moral and other branches of progress, that men should be found who really believe, if we are to judge from their actions, that a steam boiler is safe as long as there is water inside of it, and the more water the safer the boiler. We have recently enconntered an instance of this which would do credit to the old witchcraft days of 1,600 and something, which was no more or less than a pair of tubular boilers, being worked to drive a mechanical establishment; one boiler has been set 13 years, had never been insured, was working under ninety pounds of steam, and the safety valve to all appearances had not been tested for months. With the growth of the concern another boiler had been added, larger in diameter, longer, much larger fire-pit, and capable relatively of doing twice as much as the old one. An engine which may have been imported in the ark, or the Mayflower, or anywhere between those two dates, was doing service, probably on the plan that the older the engine the better the mechanical work on it, contrary to the general supposition that the better use of steam made, the cheaper the engine no matter what it costs. In conversation with the engineer we received a very frank expression of opinion, and it is, perhaps, needless to say, that this conversation was limited to about five minutes. This man expressed the opinion frankly and evidently perfectly sincere, that, so long as he had plenty of water, it was impossible for an accident to occnr. He didn't know but that gas might, under certain conditions, be formed, and, "Of course," he said, "if gas gets into the biler, then she's got to go." We questioned him as to how often he tried his safety valve levers. His answer was chracteristic of the man—"Had 'nuff to attend to without monkeying with them there fixings." Here was the solid extract of ignorance and prejudice—ignorance of his business and prejudice of toward the adoption of any regulations to insure the safety of those about him. He considered inspection, or to use his own words, "fooling around with a lamp or pick," as altogether unnecessary, and the idea of hydraulic test—he thought the best test "was to put hot water into a biler, be sure and keep plenty of water, and be sure on't." When asked about his blow off, he sometimes "blowed off when steam was low; didn't remember when he blowed off last." After seeing his safety valves had neither chain, lever, nor cord, so that they might be tested from the floor of the boiler-room, noticing that the steam gauges stood plump ninety pounds, with a boiler thirteen years old, and no one knew when it had been last examined carefully, although there was an inspection certificate hung up in the room, we bade the man good day and left.

It is one of the things to us that is totally unaccounted for, how any employer can hire a man who knows no more about his business than to weigh down the safety valve of an old boiler to carry steam at 90 pounds, when neither the man nor the foreman of the place can name the date ween the boiler received an internal inspection. "So long as there's plenty of water she's all right," is the estimation of the gnoramus who was in charge. He had not ven time to examine the safety valves occasionally, say once a week or month. Whether he was in a hurry when six o'clock at night came to adjourn to a jin mill, or some other place where his kind of intelligence was disseminated, we have no means of knowing, and, contrary to the genefally accepted theory among intelligent men, this man had a standard of his own, that the more water he had, the safer he was. Whether his safety valve was capable of raising at all or not he did not know, and evidently did not care. He was to all appearances totally ignorant of one important fact, that any accumulation of pres-sure beyond the strength of the of the boiler, of which nobody knew anything for certain, would make a blow-out somewhere, or if a rupture commenced, the more water he had in the boiler the worse for him and everbody near what would be a first-class explosion. He seemed to be perfectly ignorant of the fact that the more water the worse when anything did occur, and we presume the idea never entered his head that carrying water six inches too high in a boiler with a lively circulation would carry over a good deal of water into the cylinder, and instead of no danger, he was really threatened with several elements, each one of which only tended to aggravate the other, and as matters seldom go by contraries in this respect, we make a meutal calculation about as follows: An ignorant engineer, evidently hired because he could be employed at a cheaper rate than an intelligent, capable man. This was a negative quantity. Corroborative of this was the fact that the owners of the property did not believe in boiler inspection and insurance by people who back up their opinion from careful examination, by writing a policy for several thousand dollars upon the risk, so that the parties who saved money be employing an incompetent man, entirely ignorant of the first principle of his business, also, judging from their actions, saved money by not insuring their boilers any further than a certificate of inspection went. It is probable that hundreds of this same class of risks, which we should deem extraordinarly hazardous, do exist to-day, and that hundreds of this class of men are in charge of steam plants, when they should be carefully resting at home or breaking stone on the street, shovelling coal or snow; but they should never be permitted to have charge of a steam boiler under any circumstances or conditions. It is like an electric spark and a nitro-glycerine cartridge, we never know when the explosion is to take place. If it does take place, then we shall be treated to a digest of supernatural, providential, and the profanity of visitation. We shall be told that some "occult," "mysterious," "invisible," "gaseous," "detotation," or some other ridiculous subterfuge to avoid personal and criminal responsibility, is the cause, when, if the true fact should be rendered, it would be two brief but emphatic words—avarice and ignorance.

In many cases like this there is no doubt whatever that human life is frequently the penalty, and all too often a working man, who has not much choice of where he works, and who is generally the mainstay of a little family, is killed, crippled, seriously injured, and from two to a half-dozen people are left to the cold charity of the world, or the colder charity of employers who assume no responsibilities, in too many cases, entirely. There may be some day a change in public opinion, and a change in practice, and while intelligent men have settled all these questions in their own minds, it seems to be a farce on information and scientific investigation that men are still found that are so heedlessly negligent, who are so criminally careless that they will allow avarice to enter into their plans, while their own property and the lives of their workmen, as well as others, are projudiced by their own ignorance, stupidity and cupidity.

Wrought Iron Shanty Cook Stoves

The Best Article Ever Offered to the Trade.

I have much pleasure in drawing attention to my **WROUGHT IRON COOKING STOVE, for Shanty, Hotel and Boarding House use.** These stoves are made of **Heavy Sheet Iron**, the top and lining of the fire-box being of **Heavy Cast Metal** and all the connecting parts of substantial **Wrought Iron Work.** The dimensions of these Stoves are as follows

SINGLE OVEN STOVE

Top surface contains six 10-inch holes, with ample room between, and one oven 28 x 24 x 19. Fire box takes 28-inch wood.

DOUBLE OVEN STOVE

The Double Oven has a top surface containing twelve 10-inch pot holes, with two ovens, each 28 x 24 x 19. One fire-box of suitable size for area to be heated. Below will be found Testimonials from some of the leading Lumbermen, who have used my **Wrought Iron Cook Stoves** since I commenced manufacturing them. They are the names of gentlemen who are well known and reliable, and will carry more weight than any recommendation of my own could do.

The Best Stove I have ever Used.

PETERBOROUGH, May 31, 1880.

ADAM HALL, Esq., Peterborough. Dear Sir,—I have used your Wrought Iron Cooking Stove in our lumbering operations since its introduction here, and have no hesitation in saying that I prefer it to any other. For durability, economy and efficiency, where a large number of men are employed, it is the best stove I have ever used. You can, with confidence, offer it to hotels, boarding houses and lumbermen.

Yours truly, THOS. GEO. HAZLITT.

The Stove for Lumbermen.

PETERBOROUGH, June 1st 1880.

ADAM HALL, Esq., Peterborough. My Dear Sir,—We have used your Wrought Iron Cooking Stove and find it is very satisfactory for lumber operations, especially so on drives. We can recommend it highly.

Yours truly, J M. IRWIN

In addition to the above I can refer you to the following lumber firms who use my Wrought Iron Range exclusively in their camps:—

THE GEORGIAN BAY LUMBER CO.....Waubaushene
THE LONGFORD LUMBER CO.....Longford Mills
MESSRS. GILMOUR & CO.....Trenton and Ottawa
MESSRS. RATHBUN & CO.....Deseronto
THE MUSKOKA LUMBER CO.....Gravenhurst

EVERY STOVE GUARANTEED.

All the necessary TINWARE and CUTLERY for Shanties Supplied at the Lowest Prices.

Communications to insure insertion (if accepted) in the following number, should be in the hands of the publishers a week before the date of the next issue.

The CANADA LUMBERMAN is filed at the Offices of MESSRS SAMUEL DEACON & CO., 154 Leadenhall Street London, England, who also receive advertisements and subscriptions for this paper.

PETERBOROUGH, Ont, FEB. 15, 1886.

EXPORT DUTY ON LOGS.

THE Ottawa *Free Press* publishes an interview with a lumberman, in regard to the export duty on logs, and makes it the occasion of giving its own views on the subject. It is opposed to the views of the lumbermen, and, writing on the supposition that there is no such duty now, it objects to any duty being placed on the export of unsawn lumber. It says:—

"We are at one with the lumberman, in believing it desirable that, so far as possible, al raw material or produce should be manufactured within our limits, and give employment to the largest number of hands possible; but all experience points to the fact that it is most economical in the long run to allow the laws of supply and demand –the convenience of producer and consumer—to govern these matters and not vainly at attempt their control by the the imposition of import or export duties. The moment an export duty is imposed on logs, tha moment the timber limits of Ontario become less valuable in proportion to the export duty; and the loss will fall upon the Provincial treasury."

The theory that the laws of supply and demand should govern these matters is a very nice one, and those laws will govern the general price of lumber. But the theory is not now in practice, and that is how the Canadian lumbermen are placed at a disadvantage, and where the injustice is done. When a Canadian manufacturer exports lumber to the United States he is forced to pay $2 per M duty, but when a United States manufacturer exports the raw material, and saws it up across the lines, he is only required to pay $1 per M, board measure, and the foreign manufacturer is thus given an advantage of $1 per M. This is an injustice that should be removed, and it can be removed by increasing the export duty on logs. If the United States will not consent to reciprocity, by removing their import duty on lumber, the Canadian Government can, and should, place the Canadian dealer on a reciprocial footing by increasing the export duty on logs. This is a simple matter, easily understood, and no finely spun theories can obscure the plain facts.

The *Free Press* is oppressed with another fear. It fears that the imposition of an export duty on logs will decrease the value of the Ontario timber limits and that the Provincial treasury will suffer, which fear leads it to say:—

"A decreased Provincial revenue means one of two results necessarily—either that the Province resorts to difect taxation, or that the cost of maintaining the inmates of a number of Provincial institutions be thrown back upon the municipalities. Will the electors of this Province favor this proposal? We think not."

This result is to follow, according to the *Free Press*, if an export duty is imposed, but it has overlooked the fact that the present duty has not forced the Ontario Government to resort to direct taxation, nor to throw the cost of maintaining Provincial institutions upon the municipalities. There are, also, other considerations. It may well be considered whether it is not penny wise and pound foolish to force itmber limits wholesale upon the market and dispose of this valuable capital rapidly, instead of husbanding it so that it will increase in value and be a permanent source of revenue. If the limits are disposed of at the rate they have been direct taxation must come, but if they are husbanded more carefully and economy practiced to keep the expenditure within the revenue, that evil will be postponed much longer; so that the lumbermen are the real friends of the people in endeavoring to stop the slaughter of their timber by foreign manufacturers.

The *Free Press* has still another objection, and a not very sound one. It is thus stated:—

"Another objection, and one which weighs much with many lumbermen who see beneath the surface in this matter, is that the non-imposition of an export duty upon logs in Canada, will in a measure weaken the hostility in the United to reciprocity in lumber. The American, and especially the Michigan lumbermen, who own Canadian limits, will be favorable to reciprocity in lumber, now that their old limits in Michigan are nearly exhausted. The imposition in Canada of an export duty on logs, will cripple the sale of, or competition for, limits upon the north shore of Lakes Superior and Huron, without promoting the establishment of a single mill. Why? Because, while the logs are now exported free of duty—giving employment to Canadian backwoodsmen —giving a market to farmers and others who have supplies to sell—the moment a log is sawn into lumber and imported into the United States, it becomes subject to a duty so high that competition in the western markets with American sawn lumber becomes almost impossible."

And the *Free Press* imagines that the Michigan lumbermen who own limits in Canada will use their influence to have the United States import duty on lumber removed. Not at all. By retaining that duty the Michigan owner of Canadian limits, who exports the raw material, is given an advantage over his Canadian competitor, and this advantage he will be loth to lose, so that, instead of promoting the object the *Free Press* has in view(a reciprocity treaty), allowing matters to remain as they are is a pretty certain method of keeping up in the United States a strong opposition to such a treaty. By increasing the export duty on logs the United States owners will not find it so profitable to export the raw material, and they will then be more likely to build mills nearer their timber, in which case they would become advocates of reciprocity. So that, instead of injuring the prospects of reciprocity, the increase of the export duty would improve them.

The dream of the *Free Press* about the employment of Canadian backwoodsmen and the market for farmers is a delusive one. The United States manufacturers who own limits in Canada bring from the other side of the lines their own workmen and supplies, and the Canadian workmen find no work with them and the farmer little or no market. They receive little or no benefit from the work in the woods, and as the logs are then exported unmanufactured, Canadians are deprived of the benefit of the labor of manufacturing, and the Canadian manufacturer, who would give employment and a market to Canadians, is placed at a disadvantage to the benefit of a foreigner.

Such is the situation. Will it be allowed to continue as at present? That is the important question. It is encouraging to find a man of such generally recognized ability as the Hon. H. G. Joly giving the influence of his voice in favor of the lumbermen's view, and though his influence with the Government may not be great, his opinion should have some effect in silencing such critics as the *Free Press*. The closing paragraph of Mr. Joly's letter is significant: "It is not often," he says, "that Government can interfere, beneficially, with trade; but they can in the present case, and it is full time that they should do so." We commend Mr. Joly's opinion and the facts we have stated to those who oppose the demand of the lumbermen to be placed on an equal footing with foreigners in their own country.

TWO AIMS, ONE RESULT.

WE are pleased to note that the influential Hamilton *Spectator* adds its voice to those who are asking for an increase of the export duty on logs. The object of the Hamilton paper is primarily to conserve the forests, but it also sees the injustice done to Canadians by the present arrangement of the duties. Whether the duty is increased in order to conserve the forests, or to remove the disadvantage at which the Canadian lumberman are placed, the result will be beneficial to Canada. With two such good objects to be gained there should be no difficulty in getting the necessary increase. The following is the *Spectator's* article:—

"The appeal in behalf of Canadian forests recently made by Mr. Joly is one which deserves earnest consideration. Canada has in her timber a rich heritage, which, with proper care, might be made an inexhaustible source of wealth. Unfortunately no care is given it. Indeed, the authorities of the several Provinces seem madly bent on destroying this magnificent property instead of caring for and conserving it. For export purposes, the United States has ceased to produce timber. That country now buys more than she sells. And her remaining pine forests are being depleted at an alarmingly rapid rate. Great Britain imports wood of all descriptions in enormous quantities. In 1883 the import of wood and timber were valued at $90,000,000. That excluded wood pulp for paper, tanbark, dyewoods and other products of wood. Nearly 6,000,000 tons were of pine and fir; and of that one-fourth was from Canada. Sweden sent a little more; Russia was not far behind Canada, and the United States sent nearly a fourth as much as Canada.

Europe has nearly 750,000,000 acres under forest, of which more than two-thirds are in Russia. But Canada has more than 1,000,000,000 acres, or vastly more than all Europe. Except black walnut, which is rapidly disappearing, we have none of the more expensive woods. Our principal wealth is in pine. This timber is yearly coming into greater demand, while the sources of supply are rapidly decreasing, and prices are continually rising. In 1855 Great Britain imported less than 2,000,000 tons of fir; in 1883, almost 6,000,000 tons. Except in Austria the forests are not eared for, and the supply is becoming scarcer and more difficult of access.

Under these circumstances wisdom counsels the people of Canada to carefully preserve their pine forests—to protect them, so far as possible, from the ravages of fire, not to force their products upon a gorged market at insufficient prices, and to discourage exports of saw logs and other timber in their natural state.

Fire is the worst enemy of the pine tree. And the lumbermen themselves are principally responsible for the fires. They slash down the trees, cut out the logs and leave the chips and branches upon the ground. In a year these are as dry as tinder, and a spark from a hunter's fire or even from a pipe, sets them in a blaze. Fanned by a breeze the flames run with amazing rapidity over miles of territory, roaring through the resinous branches of the living trees, and destroying every living thing in their course. The blackened trunks of the pines stand for years but they are valueless. In Sweden the refuse of the forests is carefully collected and converted into charcoal, which is used in smelting the iron for which that country is so famous. Our pineries are so far from any point at which charcoal could be used that it would not pay to follow that plan in this country, except to a limited extent; but it surely would be profitable to destroy the refuse so that it would not become a means of loss and a source of danger. There are large tracts of timber land in Ontario which can never be subjected to cultivation by reason of the rocky and broken nature of the soil. It would be wise both for economic and climatic reasons to preserve the forests on these. The timber might be cut out as it matures and a vast preserve thus maintained for all time to come.

Mr Joly's contention that a higher export duty should be put upon saw logs is most wise. At present the United States lumberman finds it to his profit to take logs from Canada into the States and there cut them into lumber. The duty on lumber is $2 per 1,000 feet, while the logs enter free. Canadian lumbermen are thus deprived of the opportunity to cut our own logs into lumber. The Dominion has since confederation charged an export duty of $1 per 1,000 feet, calculated at board measure, on the logs exported. It would certainly be wise to increase this to at least the rate of the import duty on sawn lumber in the United States, so that there would be no pecuniary temptation to take logs rather than lumber into that country.

Next to the pine, the black birch is probably the most valuable of Canadian forest trees. In the northern country these trees grow to fine proportions, and the wood is fine grained and easily worked, while in color it is suitable for cabinet work and office furnishings. The outer part is white, while the heart of the tree is almost as black as ebony. This wood has been strangely neglected hitherto; but if its value were known it would certainly come into general use. The Pacific Junction railway, just finished, runs through a district in which millions of these trees are to be found, many of them from three to four feet in diameter."

THE PROBABLE OUTLOOK.

The Ohio *Lumber Journal*, of Cleveland makes the following observations upon the outlook in the lumber trade. The stocks of lumber in the different markets are of a sufficiency to meet moderate demands, yet there is no over surplus of any one class of stock. We take it from our reports published in this issue that there will be a firm advance as the spring buds, but we do not look for an advance that will be beyond reason. The natural tendency of all commodities is towards an advance, and we do not think there is a person in the whole world that will begrudge any advance that is likely to follow. Good business, economy and prudence warrant it; and when that warantee is so universal it strengthens and stimulates every branch of trade. The lumber merchants at the present time are feeling very conservative and are in nowise disposed to make any concessions on present prices. Many of the wholesale trade in this market are quite as busy now in filling orders as they can be with small winter forces. In a jaunt through the different arteries of the lumber trade we were surprised to note the number of customers that one meets looking over the stocks and figuring on purchases for early shipment. Reports coming to this office from all the leading markets east and west are of the same tendency and what we find of the large cities we find equally true of all the prominent small cities and interior towns throughaut the entire country. We, however, do not wish to be understood that we think the coming season will be that of a building boom. Far from it; it will, however, be one of renewed activity, such as would emanate from a successful season. As a year of railroad building we do not think it will show an exaggeration, but one where better facilities of transportation is a necessity to complete roads already commenced or in the course of construction. As to prices we think the first of April will find prices materially higher than they are at the present time; but that advance will be steady and firm. What will follow later on is a mere matter of speculation.

HARRIS, HEENAN & Co.

124 AND 126 QUEEN STREET, - - MONTREAL.

Patent Stitched–Steam Power Pressure Stretched–Oak Tanned

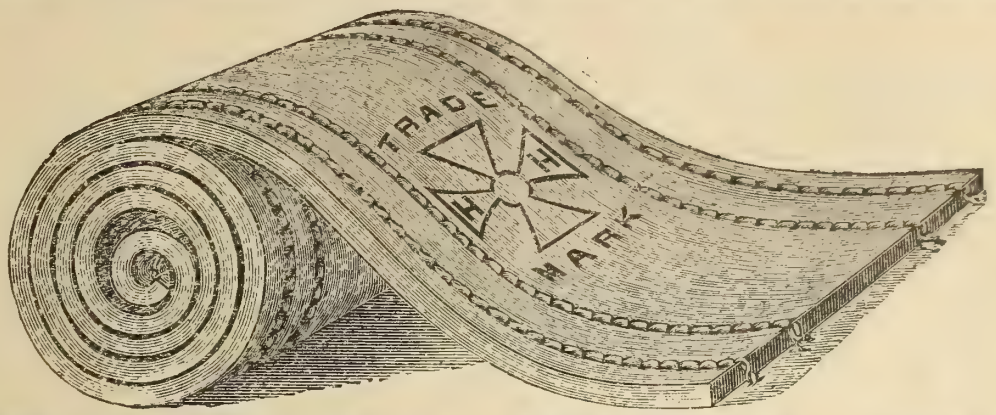
TESTIMONIAL

IRA GOULD & SONS, CITY MILLS, Nov. 13th, 1884.

Harris, Heenan & Co.

DEAR SIRS.—Your Patent Sewed Belt has been in use in our "City Mills" for some time. We are thoroughly convinced of its superiority over any belt, American or Canadian, we have used in an experience of over 35 years. It stretches so little, and gives so little trouble, that compared with riveted belting, the sewed belt saves double its price in time and laces saved. We heartily recommend it to manufacturers as the cheapest and most satisfactory belt in the market.

Yours respectfully,
W. C. MARSHALL,



TESTIMONIAL.

PECK, BENNY & Co., CANAL HORSE SHOE AND NAIL WORKS, MONTREAL, 15th Nov. 1884.

Messrs. Harris, Heenan & Co., Montreal.

I have pleasure in recommending the belting manufactured by Messrs. Harris, Heenan & Co., of this city. After thoroughly testing it, I find it greatly superior to any belting that has come under my notice and fully equal to all they claim for it, and certainly without an equal for cross or double belting.

CHAS. R. ELLACOTT,
Supt. H. S. & H. N. Dept.

LEATHER BELTING!

The Best, therefore the Cheapest, Belt in the market.
Replaces, when used, all others.
More Pliable and Durable, especially at the splices.
Stretches but little, always retains it original wid h.
Superior for Cross or Double Belts.
Runs sraight and true, does not start at the laps.
Single equals medium double.

25 per cent Stronger, 33 More Lasting, and 12⅓ Heavier, than any other Leather Belt

NORTH SHORE LUMBERERS.

"Something must be doue," remarked a lumberman prominent in the trade to a *Free Press* reporter lately, "by our legislators if we ever hope to hold our own with those Michigan men, many of whom now hold limits in the Nipissing and Lake Superior sections. Their own forests are thinned out, and they have taken a hold on ours.

"Of course I don't object to their coming to Canada for lumber," continued the gentleman, "for the more capitalists embark in such enterprises all the better for the country, but what I do object to, and strongly object to, is that they are permitted to ship crude lumber to their Michigan mills free of duty, while we, when we export sawn lumber to the United States have to pay a pretty high duty. This is most unfair to us, and we feel that we are handicapped in the race of competition. I am not speaking individually. My sentiments on this question are shared by all the prominent lumbermen on the Ottawa river."

"What are the Canadian lumbermen going to do about it?" queried the reporter.

"Well they are going to bring all the pressure they can upon the Government that a scheme may be devised whereby things will be equalized. It is certainly too bad that strange men should be allowed to use our forests and pay nothing to the treasury of the country for the permission. We have to pay our share of the country's taxation, and we consider we are entitled to a measure of protection to our business."

"What do you think would meet the wants of the trade?"

"An export duty on all logs or other timber taken out of the country in a crude state."

"What duty would be about right?"

"Well, we have discussed the matter among ourselves, and we consider that three dollars per thousand feet would about meet the case."

"Have any Americans taken over logs in the way you state?"

"Yes, and the prospects are that this business will increase. One Michigan lumbering company on the Whanapitae, called the Emery Lumbering Company, are now getting out seventy or eighty thousand logs for transportation in this manner. This firm have got barges built specially for the purpose of taking these logs over to their mills at Bay City. These barges are five hundred feet long and about fifty wide. They will be loaded with an endless chain similar to those used at saw mills. Each barge is capable of holding from four to five thousand logs. They are constructed with an elevated deck. When they reach the Bay City booms, such is the construction of the barges that their sides can be let down, and the logs thus tumbled into the water very expeditiously. This Emery Company is not the only firm with which we have to contend. I can count four such firms on the Whanapitae river alone."

"Do you think the Government will act in this matter?"

"They must. It will be brought up for discussion at the first opportunity after Parliament assembles, and we won't cease our agitation until we get justice."—*Ottawa Fress Press.*

WOOD-WORKING PATENTS.

The following list of patents relating to the wood-working interests, granted by the United States Patent Office, February 2nd, 1886, is specially reported by Franklyn H. Hough, solicitor of American and Foreign patents, 925 F. Street, N. W., Washingston, D. C.

335,335—Dovetailing machine—E. M. Byrkit, Indianapolis Ind.

335,258— Logging motor —W. M. Victor, Marinette, Wis.

335,419—Saw mill dog—W. H. Bennett, Peru, Ind.

335,319—Saw mill, gang—J. C. Slocum, Marinette, Wis.

335,167.—Saw mill gang—T. S. Wilkin, Milwaukee, Wis.

A young man named Manson Gould, of Dartford, Ont., has returned home from the woods with both feet badly frozen.

BREAKAGE AND BAND SAWS.

In reply to this query, says the *London Timber Trade Journal* amongst the most frequent cases of breakages in band-saws the following may be named :—

The use of inferior blades; unsuitable guage for the size of the saw pulleys; pulleys of machine being of too small diameter; pulley being out of balance, or too heavy; the use of improper tension arrangements; saw running on a hard and unyielding covering saw pulleys, instead of rubber bands; not slakening saws after use, thus preventing the free contraction of the saw-blade on cooling down after work; the framing of machine column being of too light a section, or too high, thus causing excessive vibration; joint in saw not being of same thickness as the rest of the blade; imperfect guides above and below the table; improper method of receiving the back thrust of saw, consequently case-hardening the back of saw-blade, and cracking same; using band-saws with angular instead of with rounded gullets at root of teeth; top pulley overturning saw; working dull saws; feeding up work too quickly to the saw; allowing sawdust to collect on the face of the saw wheel, thus causing it to become lumpy and uneven; operating the band-saw with too heavy a top wheel; stopping or starting a machine too suddenly, especially whilst using a light blade will almost certainly snap a saw in two. When it is considered that a band-saw will run from 6,000 to 9,000 lineal feet per minute, for days and weeks, and every month straight off, without breakage, and when the incalculable number of times that a saw bends over the two pulleys, and then straightens out again, is taken into consideration, it is surprising that band-saws do not break oftener. Their endurance is somewhat marvelous to contemplate. With regard to the second question, spider or velocipede wheels are now being extensively used by some makers, and seem to be a great advantage over the old cast-iron top wheel, and in mills using light saws they are certainly a saving, by preventing the breakage of the saws from the top pulley overrunning saws.

LOGS FOR 1886.

Two weeks ago the *Gazette* expressed the belief that in spite of the improvements in the condition in the woods where logging is going on, by the fall of snow and the steady cold weather it would not be impossible to get a full stock of logs for the Saginaw River mills, so much time having been lost on account of the open weather in December. The same view is now taken by the *Courier* of East Saginaw, which publishes the following rough estimate of the product that is likely to be gathered :

Tittabawassee and tributaries,	375,000,000
Rifle River	70,000,000
Au Gres' main stream	40,000,000
Smaller streams	30,000,000
Total	515,000,000

It may be safely calculated that 175,000,000 feet of railroad logs will come to the river dur the year, and as the foregoing figures show we have 34,300,000 feet of logs in the boom of the several streams, aud 48,279,512 feet of old logs now in the mill boom of the Saginaw river, the total stock for the supply of the mills should every log come out will foot up about as follows:

To be rafted	515,000,000
Railroad logs	175,000,000
Old logs	82,579,512
Total	772,579,512

About 15,000,000 feet of logs will be brought to the Saginaw from Georgian Bay, and probably about 10 000,000 feet will be towed to the river from the upper Peniusular, making a grand total of 797,000,000 feet in round numbers. Under the most favorable circumstances the output will fall short of the capacity of the mills of the Saginaw river 150,000,000 feet.—*Lumberman's Gazette.*

IN A DANGEROUS CONDITION.—Any man, woman or child is in a dangerous condition when neglecting a constipated state of the bowels. There can be no perfect health without a regular action of this funtion. Burdock Blood Bitters cure constipation by imparting a healthy tone to all the secretions

BACKWOODS DEPRAVITY.

While equally beyond reach and control of the influences of civilization, there is a strong contrast between the moral status of the Ottawa lumbering camps and those of Michigan and Northern Wisconsin. In the latter facilities are easy for the exercise of the grossest immorality, and a species of depravity appears to prevail which is wholly foreign to shanty life in the lumbering regions of Ontario. An industrious Detroiter, who has spent several winters travelling in the various camps of the Menominee district, in Northern Michigan, gives the *News* of that city a faithful report of the state of affairs in that section. "Last winter," he says, "there was about 6,000 men distributed through this section getting out the logs for the many companies which carry on winter operations there. They are of every nationality and all ages from young fellows of 18 to old men of 50. In the fall they go into the woods with a spree and in the spring they come out with a spree, which they keep up until the winter's earnings are gone.

"I shall never forget a night I spent in camp about 10 miles from Crystal Falls. There were about 200 men quartered there. It was a bitter cold night in January, and after supper some of the boys being off for a dance, they said, and as the shanty promised little except to tumble into a bunk and battle with vermin, I went with the rest. After a run of about twenty minutes we came in sight of a small clearing. In the centre stood a rudely constructed shanty, tightly enclosed by a high board fence. One of the men pulled a string. Soon after the gate was opened by a big, villaineus looking fellow, and the men followed each other through the narrow yard and into the shanty. The lower floor was one large room. At one end was a platform railed off, where an old fellow rasped a wheezy fiddle while half a dozen girls danced with their partners. A rough bar was at the other end where the old woman of the house served out whisky and cigars of the vilest kind. This woman looked well worn out for 40, but I afterwards learned she was only 26. The fiddler ceased his scraping and the dancers made a rush for the bar. All drank whisky and afterwards the women drank and smoked with the men as often as the treats went around. I observed soon that the custom was that after each dance the man had to treat his partner. The woodsmen from other camps continued to drop in for several hours and the drinking and dancing went on. At one time I counted 35 big, brawny, red-shirted fellows in the room, all taking turns in the dance.

"Of the six girls in the place only one had any marks of youth left in her face. I singled her out and asked her how long she had lived in the woods. In a careless way she related that she had followed her lover from Canada only a few months previous. That is how most of the girls got there, she said. He had brought her out to the place and then had gone away to another camp, and she was left behind because she could not pay her debt to the landlady. She had no hope of getting away before the place broke up in the spring. Even if she could get away she would not know where to go or what to do; besides, the old woman would keep all her clothes. That's what the high fence and the men on watch were for. I soon found that the women were in a living hell, from which their chances of escape were poor indeed. The girl told me that the old woman managed to keep them constantly in debt to her. She charged them for their board, rent for the bawdy short dresses in which they danced, took a percentage of their earnings, and if anything was left over she would charge up ficticious bar bills against them. The victim once caught, away from all civilization and law, is hopelessly in the toils from which she cannot escape until she has laid all her youth and vigor on the altar of sensuality. Many of the girls do not last more than one winter, so hard is their usuage. Girls who go there in the fall, fresh and in the bloom of youth, are turned out old hags in the spring. There is nothing left for them but to die. Those who survive are not acceptable any where except in a lumbering shanty, and then one year's service has detracted so much from their charms that they are pushed to the wall by the later and fresher victims. I have been around the woods enough to know that there are fully one thousand of these dance houses in Michigan and Northern Wisconsin in which there are yearly not less than seven thousand women worn out, and most of them start their mad career under protset. The men who supply the girls are the favored ones, and are all free to them.

"The lumber companies are endeavoring to abate the horrible practice by refusing to accept orders from the men for their pay. This cuts off the supply of cash, and in a few seasons the dance house of the lumbering camps will probably become only a tradition."—*Ottawa Free Press.*

CONTINUED INACTIVITY OF TRADE

The *Timber Trades Journal* of Janury 23rd says:—The dock deliveries, we observe, for 1886, as far as it has gone, compare unfavorably with 1885. Only a short time since we were lamenting 1885 being so short of its predecessor; is this declining tendency still to go on? Let us hope the novelty of the Queen in person opening Parliament will give a spurt to trade in the metropolis that will extend itself as far east as the Surrey Commercial Docks. What is wanted just now is confidence in the uprising of trade, and if those who have money could see a reasonable prospect of things taking a turn for the better, they would launch out, and hasten the very event they are desiring. But in what direction is the improvement to come from if things remain in their present normal state? Are shippers going to curtail their productions to help the timber market, is money to get any cheaper, or is some new goldfield to be discovered ere the lagging trade of the country receives the impetus necessary to bring locked up capital into circulation? As far as the timber trade is concerned there can be little question but that we import much more than we actually require. It is no use looking back a dozen years or so, because then there was a good export trade in the way of transhipments; while very little is now done in that way, the shipments being made direct from the producers to our colonial markets. If the imports to London, and to the outports as well, were limited to two-thirds of what they are for a season or two, the market might recover itself, but the chance of such a thing is not within the bounds of possibility. The forest exhaustion, too, which was made such a mountain of ten years ago, we have heard nothing more about. Judging from what happens at our own doors, we take it for granted that instead of exhausting the forests new ones are being cut into, and practically an inexhaustible and ever-increasing supply is to be the prospect of the future. While this surplusage goes on, with business running in a regular groove, the value of the wood cannot increase, and the efforts required to sustain it at its present level are palpable evidence of its artificial character. Till the laws of supply and demand have been left to their own regulation we shall experience the same state of uncertainty hanging over the market. Of course any new channels of distribution that may be developed will bring about a better state of things, and we are anxious that some extended area of consumption may be discovered, to lessen the strain on prices derived from a chronic over supply, but we must not be too sanguine about such a result happening.

Freights seem to be going anyhow, and the decline first noticeable on the other side of the Atlantic appears to have extended itself to the Baltic. Firewood at 32s. 6d. a fathom, sailing ships, is a contrast to the 45s. of two or three seasons ago.

In America there may be some revival, but the lumber papers speak of it rather as hoped for than confirmed.

It reported that the Canadian Pacific Railway Company has contracted for 25,000 cords of wood and 500,000 ties to be delivered along its lines.

A cedar tree, standing in Middle Branch township, Osceola county, Mich., measures 13 feet 10 inches in circumference 3 feet from the root, and is sound as a nut.

A STUMPAGE AGITATION.

The agitation in lumbering circles in New Brunswick against the excessive stumpage imposed by the Government is widening, and will scarcely end until a change for the better has been brought about. The large lumbermen, who are also sawmill owners in many cases, have a real grievance, and the Government and Legislature will be obliged to recognize the fact and govern themselves accordingly.

It is clearly proven that the stumpage of $1.25 per M feet, board measure, on spruce logs, is out of all proportion to the value. These logs are worth at the mill only about $5 per M feet; they are, of course, worth much less standing in the trees; so that the Government actually exacts more than 25 per cent of the value. Such a tax on an important industry is out of all proportion. Even if the Government were of any assistance to the lumbermen or gave back any portion of this excessive tax in any way, it would still be impossible to continue lumbering at a profit in many parts of that Province, but the Government does nothing of the kind. In fact, its policy is handicapping the lumbermen of the Province in competition with those of other Provinces and countries. The competition with Norway is never ending and the odds are against New Brunswick, but against such competitors as Quebec with its 40 cents stumpage on spruce and Nova Scotia where the Government exacts only 60 cents, how is the New Brunswick lumberman to bear up with his $1.25 per M feet imposition? Moreover, in recent years, when the English timber and deal markets have been growing more and more uncertain, and the legitimate expenses of lumbering have been steadily augmenting, the New Brunswick Government have gone on increasing stumpage from 60 cents per M feet in 1875 to $1.25 in 1885. The business will only stand so much squeezing; beyond that the power of taxation avails nothing. It is easy to say that the lumbermen and the lumber manufacturers must go on, but they can't go on; their resources are not equal to the steady losses which in many cases must be sustained. At the very best their operations must be curtailed, only the choicest territory will be operated upon, and a serious reduction of lumber exports must result. This has been the case in New Brunswick for several years past, and it now remains with the Provincial Government to say how long this drying up process is to last, for the end must come before many years unless the Government and Legislature change their tactics.

We notice that in a recent address in the Northumberland County Council, a councillor from Chatham, Mr. D. G. Smith, took occasion to deal with this subject at length and satisfactorily. The circumstance show that the subject comes home to the people, and we should not be surprised to find it becoming a topic of discussion at most of the municipal gatherings in that Province, where the lumbering business is so universally connected and interwoven with all other industries end business operations. In fact, there more than in most parts of the world the lumberman's industry is the real basis of the country's prosperity or want of prosperity. It sets all other wheels in motion; and now that the shipbuilding business is under a cloud it has become a more important factor in the industrial situation than ever. Hence the interest that is taken in the stumpage question and the importance it is likely to assume at the next sitting of the New Brunswick Legislature. It is one of these questions around which all commercial interests and all local industrial interests will rally.—*Montreal Herald.*

WORK IN THE WOODS.

Mr. Thomas Hale, a well-known Upper Ottawa lumberman, was in the city yesterday, and in answer to a query by a *Press Press* reporter said:—"The prospects for the coming season in the lumber business are good, in fact I may say bright. In the woods everything is going on as well as any reasonable person could expect. On the north side of Lake Nipissing, where I am working, things are quite brisk. I intend to get out about 70,000 logs which will be drawn to the lake, then towed to Mr. J. R. Booth's railway and by that transported to Nosbonsing lake, and then by the Mattawa to the Ottawa river. With regard to square timber, Messrs. Barnet & Mackay are getting out some fine timber on Sturgeon river, as is also Mr. Hugh Coburn. Barnet & Mackay's timber will be brought to the Quebec market by the C. P. R. Further up the railroad line Messrs. Timmins & Gorman are getting out two rafts of square timber which will also be shipped by the C. P. R. Shipping by rail has this advantage over the water route, that it is got very early into the market, and another thing it is not subject to the drawbacks which often follow from a lack of water in driving.

"Is that portion of Nipissing well wooded?" questioned the reporter.

"About the Whanapitae country the pine is of a very good quality, and I may say of almost unlimited extent. In fact, the country may be said to be as yet unexplored, but what has been travelled over is very rich in timber resources."

"You think a large timber trade will be developed up there?"

"It must. The timber is there and the facilities for getting it out are very good, and you may be sure that the country will not be long left unoccupied. Many American lumber companies are casting greedy eyes on the territory, and it would not be surprising if some of these companies would be found operating them next winter. The pine is of good quality and abundant."

"Have you much snow up north?" asked the reporter.

"About two feet, I should judge, and the roads could not be better."—*Ottawa Free Press.*

THE LONGFORD LUMBER COMPANY.

To the Editor of the Canada Lumberman.

Sir,—Having received an invitation from the secretary of the Longford Lumber Company to visit the operations of that company I availed myself of the opportunity. Accordingly I took the Midland railway on Monday morning and arrived at the Longford mills and partook of dinner, and in about half an hour set off with the company's splendid span of brown horses in company with the secretary—who, by the way, is one of our own town boys—who did everything to make my trip comfortable and pleasant. After we set out from the mills we crossed a beautiful little lake called St. John, and then proceeded on our way up the Muck road, to what is known as the company's

"DIGBY FARM,"

24 miles distant. Arriving before dark I proceeded to make an inspection of that fine property. The farm is situated in the township of Digby, county of Victoria: it is composed of some 360 acres, beautifully situated, cornering on the two townships. The buildings on it are a commodious farm house, a fine store and storehouse, capable of storing sufficient grain, meat and other supplies to supply their eight camps; large barns, and immense cattle byres, where they have 90 head of cattle, all good grades, and stables for eight span of horses, an immense piggery large enough to hold 25 to 30 hogs, and also a large henery filled with fowl. The woods manager, Mr. Jas. Porter, lives here and John McRae is in charge of the store and is paymaster for the camps.

AN IMMENSE VOLUME

of business is done, upwards of 14,000 bushels of oats, 250 ton of hay and 35 to 40 ton of pork and beef are annually purchased and paid for in cash, and all kinds of farm produce is readily disposed off by the farmers of the surrounding country, who seem to be exceedingly well satisfied with all their dealing with the company. In addition to the above supplies about 15 car loads of other supplies are brought over the G. T. R. to Victoria Road and thence teamed in to this point some 11 miles.

On Tuesday morning we started north for the

TOWNSHIP OF LONGFORD.

At 10 o'clock we arrived at the first camp and a right royal welcome we received. Mr. N. Whalen has charge here, and after many years of practical experience he seems to have his part in first-class shape, and his drawing well in hand, expecting to be through about the middle of February. The next camp was then visited, Mr. P. Dwyr is forman, he is well along

with his work. Having partaken of an excellent dinner we proceeded to the next camp, having to cross a nice large lake before arriving at M. Murphy's camp, where we spent the night. Arriving early here we pushed off to see part of the work of loading the big one beam sleighs with immense saw logs off tremendous skidways. We were informed here that this camp will produce some of the largest and finest logs cut this year in the township. We enjoyed camp life in good earnest during the night and next moring set out on our journey to camp 4 managed by Mark Hartley. Here we found one of the most

COMPLETE AND PICTURESQUE

places to be seen in that country; the camp buildings are situated on the shore of a lovely little lake and everything looked so tidy and comfortable it would make anyone enjoy a meal with a relish in such a lovely spot. After an inspection of his roads and drawing to the dumping ground on Brown's Lake, and having partaken of dinner, we started down the lake to Thos. Archer's camp at the mouth of a creek where the logs from this section enter, when being driven in the spring to the main river. On this creek the company have

ERECTED TWELVE DAMS

capable of holding back sufficient water to run the creek with ease. We stopped over night with Mr. Archer and in the morning started for Mr. A. Ross' camp, which we reached about ten o'clock. We passed over several of his roads and saw a number of fine roads got out at this camp. We passed over a very rough piece of rocky country to the next camp managed by B. Pearson, where we partook of an excellent dinner, having seen a very large number of his logs on our way down the creek, which we followed some twelve miles, arriving at a junction south where it enters the west branch of the Black river, which we crossed and took our way north on the old Victoria road to N. Tallman's camp, where we remained for the night. On our arrival at this camp we got aboard of a pair of immense one beam saw log sleighs and visited some large skidways of fine logs and followed them to the dump on Black river. Friday morning we started on our homeward trip via Digby farm to Longford Mills, after being absent from home one week. After this description of this unmense concern, which to my mind is the most compact and complete in every department of its management, your readers will no doubt be glad to know something of the

OUTPUT OF THIS COMPANY,

which I will try to give you a faint idea of.

The number of logs cut in the eight camps and by four jobbers is about 150,000 pieces, which are being measured and counted by two competent cullers, Mr. Geo. J. Overend and Mr. Edward Adair. One very important feature is the accurate manner of marking the logs. It is done in this way: Each camp is numbered, viz., 1, 2, 3, 4, 5, 6, 7 and 8, and each foreman marks his logs with hammers of his own number, so that the management may detect any logs not properly taken out and the foreman is accordingly held responsible.

This company is managed

ALL BY YOUNG MEN

who are native born boys of Peterborough. The president is Mr. Wm. Thomson, and one of the directors Mr. Geo. Thomson, with Mr. Maxwell Hall as secretary.

In addition to this concern the same directorate manage two large farms and another large company known as the Rama Timber Transport Company, of Rama, Ont. To the pluck and energy of the directorate, together with good sound judgment and an army of the most faithful men it has ever been my lot to meet with, belong the success of these gigantic enterprises. Hoping, Mr. Editor, I have not wearied you with my long letter, I am,

YOUR CORRESPONDENT.

Peterborough, Jan. 1st, 1886.

TWENTY or thrity years ago, walnut wood was cut up into fence rails or even sold as fuel to steamers in Western Ontario. Now, when our forests are denuded of it, and it is worth from $30 to $140 per thousand feet, dealers are glad to buy the walnut fence rails, seasoned by 20 years exposure, and to make them into legs, spindles or backs of chairs.

Chips.

THE log cut at Machias river, Me, will this year amount to 12,000,000 feet.

MR. W. H. LAKE, who has for many years been in charge of Eagle Mill at Rossmore, has been appointed manager of the Rathbun Company agency at Picton.

IN making the halfpenny bundles of wood £250 000 is paid annually in the shape of wages, 20,000 persons being actively employed in the work in the metropolitan district.

CHICAGO agents are in Door county, Wisconsin, offering 16 to 20 cents for cedar railway ties, delivered on the piers of that locality, and 26 to 38 cents delivered in Chicago. This is an advance of three to four cents on the price of last year.

EIGHT years ago 5,000 acres of pine land on Salt river, Mich., was purchased for 62½ cents an acre. The purchaser took 40,000,000 feet of logs off the land, and finally sold it for one dollar acre. That's how pine land owners get rich.

TWO Germans of Wabash, Ind, were loading logs in the woods near there when a log rolled back on Jacob Christman and caught him by the hips. His companion, unable to move the log any other way, rolled it over his body and head, inflicting fatal injuries.

ENGLISH oak has lately been exported to New York, selling there at 20 cents a foot; but our cousins have "Englished" or "doctored" a lot of American oak, and it would puzzle an expert, says the *Manufacturer's Gazette*, to tell the two woods apart; and the local wood can be sold for five cents.

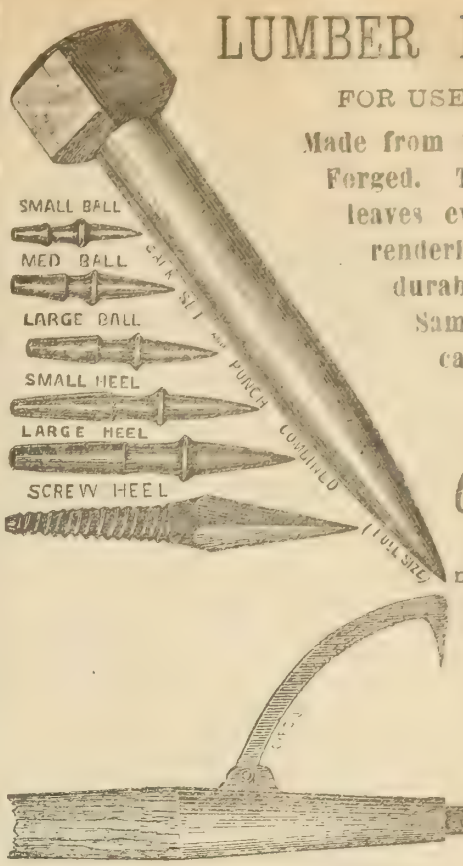
ADRIAN NELSON, of Little split Rock, Lake Winnipeg, Manitoba, has written a letter to the *Free Press*, Winnipeg, Manitoba, correcting a former statement made by himself that there was no Norway pine on the east side of Lake Winnipeg. He now says that there are forests of very fine trees, but they do not stand thickly on the ground. He thinks that thorough exploration will disclose the fact that there are extensive belts of Norway pine that touch the lake at different points.

A VERACIOUS writer in the American *Rural Home* tells that "in the lumbering camps of Canada" the men eat ants in lieu of pickles. The lumbering camps of Canada are run during the winter, and, admitting that lumbermen like ants better than pickles, perhaps the veracious correspondent of the *Rural Home* will tell us if it is not a little rough on the ants to make them walk around on the top of two or three feet of snow, for the purpose of being caught and eaten.

ON January 22nd, C. W. Richardson, F. W. Gilchrist and W. H. & E. K. Potter purchased of a Mr. Smithson, of Chicago, a large tract of pine timber in the Province of Ontario, Canada, on the north shore of Lake Huron. It is limit No. 169, a tract six miles square, or a township, containing between 100,000,000 and 150,000,000 feet of timber. The parties named each own a third. The purchase price was $75,000. Including this last purchase about $400,000 has been invested by Alpena parties in Canadian pine within a year.

Catarrh—A New Treatment.

Perhaps the most extraordinary that success has been achieved in modern science has been attained by the Dixon treatment for Catarrh Out of 2,000 patients treated during the past six months, fully ninety per cent. have been cured of this stubborn malady. This is none the less startling when it is remembered that not five per cent. of the patients presenting themselves to the regular practitioner are benefitted, while the patent medicines and other advertised cures never record a cure at all. Starting with the claim now generally believed by the most scientific men that the disease is due to the presence of living parasites in the tissues, Mr. Dixon at once adapted his cure to their extermination; this accomplished the Catarrh is practically cured, and the permanency is unquestioned, as cures effected by him four years ago are cures still. No one else has ever attempted to cure Catarrh in this manner, and no other treatment has ever cured Catarrh. The application of the remedy is simple and can be done at home, and the present season of the year is the most favorable for a speedy and permanent cure, the majority of cases being cured at one treatment. Sufferers should correspond with Messrs. A. H. DIXON & SON, 305 King street west, Toronto, Canada, and enclose a stamp for their treatise on Catarrh.—*Montreal Star.* 1y12,



LUMBER DRIVERS' CALKS

FOR USE IN STREAM DRIVING.

Made from the Best Refined Tool Steel and Forged. The method used in tempering leaves every one of the same temper, rendering them stronger and more durable than any other Calks made. Samples and prices free on application to the undersigned.

THE

Orono Cant Dog

Strongest and Lightest in the market. Made of Best Cast Steel by drop forging process. The Handles are made of best quality straight grained split and turned Rock Maple, 5 to 6 feet in length, bored specially to suit the pick. Prices on application.

Market Reports.

TORONTO.

From Our Own Correspondent.

FEB. 9.— Trade, considering the severe weather of the past two weeks, has been fair; wholesale dealers, in fact, have been able to dispose of the greater part of their stocks as fast as it came in by rail. More especially has this been the case in regard to cutting up and better, 1½ in. and 2 in., much more of this class of lumber could be disposed of if it could be obtained. Enquiries from the west have come in freely since the present month opened. Several American buyers have also put in their appearance lately, but as predicted in some of my previous letters, we have nothing to sell of the class of lumber they require. Everything in the shape of good cuts and better is shipped out from the mills and factory men will have to keep their dry kilns in operation until the new stock is in fit condition to ship.

It is generally conceded that the outlook for the spring trade is good, although brick building cannot be pushed forward until late in the spring, as bricks are entirely run out, and builders will have to wait until the first kilns are burnt.

The larger part of the wholesale dealers have taken a step in the right direction by resolving not to break up car loads. This will give the retail men a much better chance and the wholesalemen will be better off at the end of season. Car load lots when piled off by the track side and broken up rarely hold out in measurement and sometimes disappear entirely, perhaps not in all cases by direct theft, but hauled away by mistake for other lumber, but unfortunately the mistake is rarely found out and rectified. Retail men also have hitherto been able to get parts of cars, but under the present rule if they desire any part of a car load they will have to purchase the entire load in order to obtain the particular portion they desire. It only remains for the wholesale men to go a step further and let the retail men do the entire trade with the consumer. There would be nothing lost by taking this additional step. The same amount of lumber would be disposed of and in a more satisfactory way, and the retailers by reason of better trade, or more of it, would be in better shape to meet their engagements with wholesale men.

Prices remain at the yards about the same, except on dressing and better plank, the latter will command from $3.00 to $4.00 per M above former quotations, owing, of course to its present scarcity. Bill stuff will likely advance 50 cents per M with the opening of the spring work, this being the advance now on car load ots.

OTTAWA.

From Our Own Correspondent.

FEB. 8.—The chief lumbermen of this district are awakening to the fact that there is competition in the field which will have a tendency to reduce their profits and curtail their operations in no inconsiderable manner. I refer to the export of unsawn lumber from the Nipissing and Lake Superior section to the saw mills in Michigan. I had a talk with several of the prominent men in the trade on this subject, and they give it as their opinion that unless an export duty is placed on all crude lumber taken out of Canada their prospects will be seriously crippled. "We don't object," said one well known Ottawa river lumberman, "to Americans, or American capital coming in here, for the more money comes in the better for the country, but we do strongly object to these men coming in here, cutting logs and exporting them to their mills on the other side, without paying one cent into the revenue of the country, while the lumber which we export we have to pay a high duty on. This is uufair to us and we shall do all in our power to bring this matter before parliament as soon as convenient after the session opens. The way things stand now we are materially handicapped, and I think the Dominion Government should place an export duty of $3 per thousand feet on all crude lumber shipped out of the Dominion. For some time past Michigan millowners have been quietly buying up untouched timber limits on the Nipissing and Lake Superior section with a view to supplying their mills. Their own forests are thinned out, and looking around for new fields they have selected the sections I have named on account of their convenience. Several of these American companies have already secured valuable limits on the Whanapitae river alone, and own hundreds of miles of territory over which they can operate. One of these companies, the Emery Lumber Company, have a very large limit on the stream referred to, and are now putting out logs to the number of 70,000. As the stream is particularly easy of driving no difficulty will be experienced in getting them into Georgian Bay. The company have had two barges specially constructed for the transportation of these logs. These barges will be 500 feet long and 50 wide, and will be loaded with an endless chain, similar to that used in a saw mill. The motive power will be supplied by a small engine. The deck of these barges will be elevated, and on arriving at the Bay City booms the sides of the barge can be lowered so that the process of unloading can be done very expeditiously. Each of these barges are capable of carrying from four to five thousand logs in one cargo. This process," continued the lumberman, "gives them a great advantage. We have to drive our logs and other timber for hundreds of miles, construct costly improvements for the purpose of forwarding the work, and even then run the risk of having the logs stuck and our capital lying idle for a year, while these American firms are certain of getting their logs to the saw, and at an early date in the season. This, with their not paying any export duty, gives them an unfair advantage over us which should be remedied, and we are bound to bring all the pressure we can on the Government to protect the native industry of the Ottawa Valley. If these men erected mills on their limits and sawed the lumber here, giving employment to Canadian labor and making a market for Canadian produce, it would be all right enough. But to strip our forests of their best timber, and pay nothing for the privilege, save the price for the limit, is asking too much."

The feeling is very strong amongst the Ottawa river lumbermen just now on this question, and most likely the Dominion Parliament will be called upon to devise a scheme whereby the lumber industry may be protected against foreign competition.

WINNIPEG.

The *Commercial* says:—There has been no factor of any kind to induce a movement in this trade. No building operations are being gone on with at present, and there is no apparent disposition to anticipate wants for the future. Consequently business is dead, so far as any present movement is concerned. Some shipments were made to the new stations along the lately constructed railway lines, but these are now about supplied. The next move will probably be towards far western points, where the building season commences considerably earlier than in Manitoba.

LIVERPOOL.

The *Timber Trades Journal* of Jan. 30th says:—With the exception of the interest created by the public sales of this week, the trade has evidently relapsed into the same dreary groove in which it ran so long last year, and from the general run of conversation there is not likely to be any material change in it for some time to come.

Importers do not seem disposed to contract for cargoes to arrive, and it is probable that sellers will experience quite as great difficulties as they have already done in placing future supplies upon the market.

There is a general opinion amongst the leading merchants and bankers that some signs of improvement in trade are discernible in America, and as such a movement is not unfrequently followed on this side, there may be better times in store for us at no distant date, but the timber trade is generally the last to participate in any upward movement.

Then again, this market is likely to be fully supplied with pitch-pine and spruce during the coming season, which with the sufficient stocks on hand, will tend to keep prices down to a low level. If your neighbors in Manchester could only get their Ship Canal scheme floated and their set works going, we should, no doubt, participate in the general spending of the money, as a considerable quantity of timber of one kind or another will necessarily be used during and in its construction. At present, however, the necessary funds do not seem to be forth coming with that rapidity its sanguine promoters expected. Many of your readers will be acquainted with the old-established timber yard of the late firm of Messrs. Thomas Bryde and Son, of Grenville Street, in this city, which we see is to be sold by tender, including the and goodwill. It has been carried on for about three-quarters of a century, and is well known in the North and Midland districts for its high reputation in wainscot, mahogany, and other furniture goods.

LONDON.

The *Timber Trade Journal* of Jan. 30th says, The gathering at Messrs. Churchill & Sims' sale on Wednesday last was one of the largest that we have seen this year, the regular London trade being augmented by a good sprinkling of county buyers, who, however, by the few provincial names that we recognise opposite the prices, came with the expectation of getting what they wanted at much lower prices than actually ruled. Not that prices took a high range; on the contrary they were on the same depressed scale to which we have so long become accustomed, and which the news of transfer of power from the Royal Commission on Trade to the party pledged to internal reforms is hardly likely to assist. The chief attraction on the first day was the Quebec pine, and the red descriptions, ex Persia we consider sold remarkably well. The yellow pine was not particularly choice, and the 2nds bright 2in., ex Suffolk we reckon realized fully what they were worth. The 1st boards ex Florida, a transhipment at £28 15s. and £29, we cannot find much fault with on the score of value, though the current price for similar description direct from Quebec to the docks stands at £32 10s which holders experience no difficulty in obtaining. It makes all the difference whether goods of this high class have been picked over or not. The parcel in the West India Docks, ex Kalliope 13 ft. best regulars, for rather fresh goods of this kind 1sts are now realising £28, and 2nds £19; so that the sale-buyer after all has very little pull.

Timber sold rather low; the square pine logs 33 ft. long and upwards being knocked down to one buyer at 75s. per load is not so bad considering the slackness of the demand and the quantities in the dock ponds. Waney also was cheap at 55s. to 57s 6d. Ash and elm prices also harmonise with the dull state of trade, and show no recovery.

Uleaborg goods are generally well represented in Messrs Churchill & Sims' sales, but on Wednesday the parcels offered were almost entirely batten sizes. Lathwood seems to rally, and most of the lots submitted reached £5 5s.

Flooring was active, inch being particularly so, but the recorded prices do not show much benifical result, 1st Christiania yellow 1x7 falling at 9s 6d., and 3rd Soderham red at 7s. 3d., while a lot of Sundswall of this quality, J.A E. mark fetched only 6s. 6d. There are plenty of bidders at a price; you see a crowded room and an apparent anxiety to secure what is offered, but if you happen to ask an acquaintance why he stopped short at a low figure when another 3d. would have to secure the goods—the invariably answer is, "Let them go; I don't want them." They attend to buy in the hopes of getting something they may have a call for much under value, not because they are short of the stock they bid for. All are not like this but that undoubtedly is the position of the majority of the trade.

Thursday's sale fell very flat; there was nothing like the attendance of the previous day, and the bidding lacked spirit throughout. Perhaps when the flooring was submitted there was a little more life imparted to the sale, but prices ruled low throughout. There was the same readiness to secure the lots going, but only at a low limit, which bidders very seldom exceed. It was plain that the bidding was not stimulated by any actual want of the stuff, and had no backbone in it.

GLASGOW.

The *Timber Trades Journal* of Jan., 30th, says:—A cargo of teak timber at Greenock is the principal arrival we have to note for the week; other wood imports consisting of small parcels of staves &c., at Glascow per steamers. Two auction sales have taken place, one of log timber, chiefly at Greenock, and the other at Glasgow, the goods offered consisted of deals, and also included some Yeymouth birch timber for which, however, there were no bidding.

Notes of prices is appended; a quiet demand was experienced at these sales, and of the goods offered only a small portion was sold.

For a number of the lots withdrawn their was bidding, which, however, did not come up to a figure acceptable to the brokers; there were some sales made afterwards privately.

The transactions publicly at the sale of deals here were chiefly Miramichi pine deals, the stock of which, as is well known, is comparatively low.

AUCTION SALES.

On 21st inst., at Greenock, Messrs. Allison Cousland & Hamilton, brokers:—

		per c. ft
Quebec waney boardwood		s. d.

CHICAGO.

AT THE YARDS.

The *Northwestern Lumberman* says:—The weather for the past week has been particularly unfavorable to trade. If there was any previous tendency to revival, the snowstorms and cold wave were sufficent to check it. The yards now look dreary and unbuisness-like in their mantle of snow. As a general thing no attempt has been made to keep all the alleys clear or shovel the snow off the piles. The snow has come for a month past in a succession of heavy and light falls alternating, with some thawing and freezing, so that the snow is exceedingly solid, and to a large degree resembling ice more than snow. The accumulation in the alleys and roadways has been packed as hard as pavement almost, so that it will require many days of warm weather to render the yards easy to work in.

Yet there has been a steady call for lumber all winter. Many dealers say that their sales during January were considerably in excess of those of January 1885. The demand has been like the dropping of a slow rain in May—hardly noticeable, but coming a little all the time. Dealers who make a specialty of supplying yards with assortments state that they have had a good wagon trade all winter—better than usual at this season. This shows that there has been a constant distribution; for yards do not need a replenishment of assorts when there is no trade. It likewise shows that there is a scarcity of special kinds of dry lumber, and that a sudden start of trade in the latter part of this month, or the first of March, would render this shortage of dry stock still more pronounced; for the winter has not been favorable to drying lumber.

The demand for car-building stuff has served to keep a little life in winter trade. This call does not take a wide scope in yard stock, but it enables dealers to work off short white pine strips and Norway two-inch common for decking, and Norway clear strips for lining, at good prices, often at an advance on corresponding, grades for other purposes. This demand is still well maintained, and gives no sign of abatement. It has already been sufficient to nearly clean out of market the specialities called for, and prices have lately stiffened.

There begins to be a little stir in the thick lumber market. The movement eastward is increasing, and the call from the sash and door factories is beginning to be felt. No fear need be entertained by the holders of thick selects and uppers. There is not such a surplus of these classes of lumber in the country at large as to lead to apprehension of a decline in prices, while an advance is possible.

The movement of lumber to eastern points is increasing, as can plainly be seen by the large sprinkling of eastern line cars in the make-up of trains. The slight reduction of eastwise freight rates may have acted as a stimulus to movement in that direction, and it is barely possible that heavy shippers are getting rates lower than the open ones.

Country yard men are not yet making violent effort toward the replenishment of their stocks. The winter has been against them and their farmer customers. Roads are blocked with snow in some sections, the weather has been extremely cold, and prices of grain are so low that farmers feel poor. Yet enquiries for estimates begin to come, and in such a number as shows trade in the near future. A few days of mild weather would bring new life into the district

The question of spring prices is now a vital one to holders of lumber and intending purchasers. As a general statement, wholesale dealers are insisting on firmer prices than prevailed last fall. Of course the pertinacity of their grip will be fully tested only when the traveling men take the road. At the present it is safe to say that values range from 75 cents to $1 a thousand higher than they were last fall. There may be exceptions to this general rule, but as yet trading has been too light for such exceptions to make the market. Sellers to the local trade insist on firm prices on dry lumber for assortments. There can be no motive for serious cuts in prices, unless some house catches a fright at imaginary evil in prospects, and resolves to unload. In such a case there is no stopping a man in his wild career. One house has resolved to go out of business on May 1. There will probably be others, but such determination is yet to developed. The fewer spring close outs there are the easier it will be to maintain prices.

Receipts of lumber and shingles, for the week ending Feb. 4th as reported from the Lumberman's Exchange:—

	RECEIPTS. Lumber.	Shingles.

FOR THE

Canada Lumberman

IT WILL PAY YOU, BECAUSE :

1. It is the only newspaper published in the Dominion of Canada devoted to the lumber and timber industries.
2. It is devoted to the development and utilization of our forest wealth.
3. It furnishes complete and reliable quotations of prices of lumber in all the leading markets.
4. Its columns are filled with interesting reading matter, valuable alike to the land owner, manufacturer or dealer.
5. It costs only $2.00 per year to have it sent, post-paid, to any address in Canada, and no land owner, lumber dealer, manufacturer or individual in any way connected with timber industries, can afford to do without it.

☞TO ADVERTISERS.

It has a circulation among saw mill owners, manufacturers, lumber and timber dealers and all classes connected with the timber business.

Examine the field, count the cost, and you will at once decide that the CANADA LUMBERMAN is the

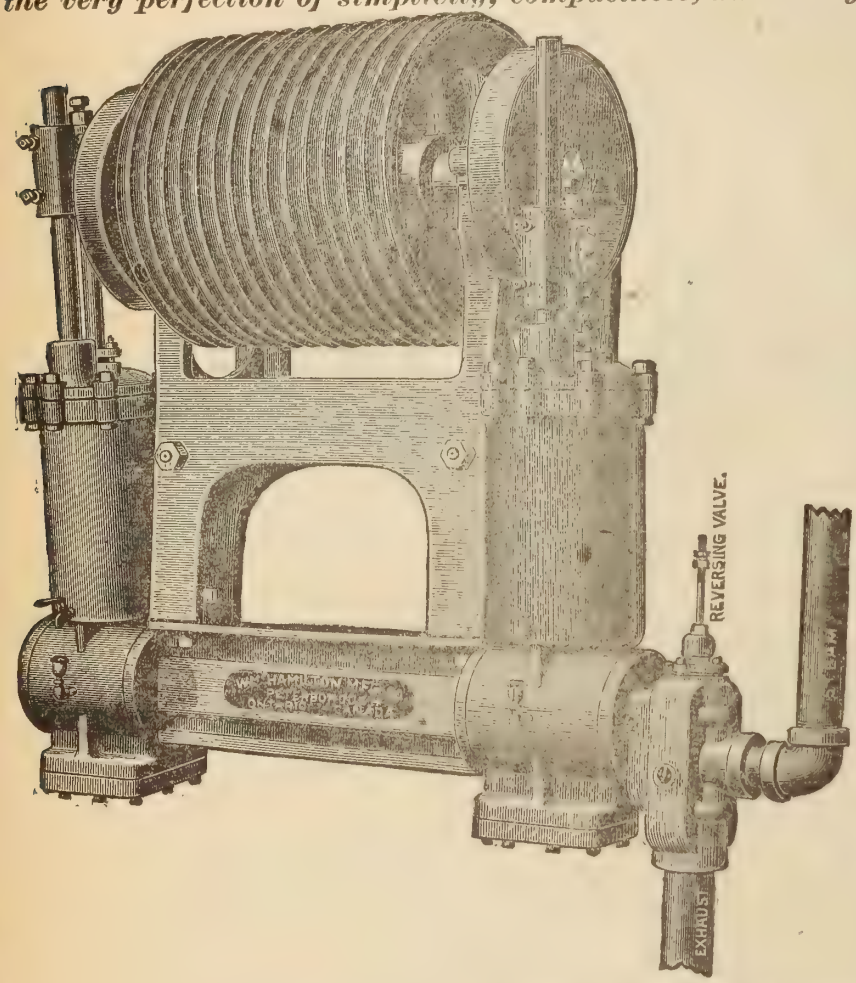
——CHEAPEST, BEST, MOST RELIABLE and ONLY TRUE MEDIUM——

for placing your goods or wares before the saw-mill men and lumber and timber dealers of the Dominion.

CUNNINGHAM'S
PATENT OSCILLATING TWIN ENGINE

FOR STEAM FED IN CIRCULAR MILLS WITH RACK OR ROPE.

This Engine has practically but two moving parts, aside from cranks and shafts. The whole array of eccentrics, valves, valve rods, connecting rods, cross heads, slides, levers, rock shafts, bell cranks, etc., is done away with, and the very perfection of simplicity, compactness, durability and cheapness attained.



The above engraving illustrates the Twin Engine, 10x16, for Rope Feed, for Saw Mill Carriages. The spool is 27 in. diameter, 30 in. face, is grooved 2 in. pitch for $1\frac{1}{2}$ in. rope. The shaft is steel, $4\frac{1}{2}$ in. diameter, with disk cranks. No connecting rods, eccentrics or valve rods to get loose and out of order. The ports are in the trunions, and worked by an oscilliation of the cylinders, and are held in their place in the downward motion by a steam cushion below. The sawyer's valve is a perfect balance, and by moving this valve the engine can be reversed, stopped or started almost instantaneously if necessary, as the sawyer has perfect control of it by his lever either to go fast or slow. Should the sawyer let go of his lever either by mistake or any other cause, it is balanced so that the valve will come to the centre and cut the steam off both cylinders and stop the feed. When standing, the lever is locked or fastended, so that is is impossible for it to start off itself. The engine stands upright below the carriage, and bolted to two upright beams, placed on the mill for the purpose. When a rack is preferred in place of the rope, we put on a steel wheel 30 in. in diameter, and the engine placed high enough to work into the rack on carriage bar, or if the beams come in the way, an idler wheel can be used between engine and rack segs; or, the engine can be placed at a distance and have a shaft from it to the carriage; or it can be placed in the engine room, where it is under the control of the engineer for oiling, thence by shaft and pinion to carriage rack bars. These engines are well adapted for cutting long logs, or where the logs are mixed, the advantage of this feed will be apparent to mill men. When the carriages are used in two or more sections, the coupling and uncoup ling of each section is quick and simple.

There were two of these feeds working this summer and giving the best of satisfaction, one with rope feed at James Playfair & Co's Mill, Sturgeon Bay, near Waubaushene, and one at the new mill furnished by us to Francis Carswell & Co., at Calabogie Lake, on the Kingston and Pembroke R. R. This mill is working with the Rack and Pinion feed, and drops from fifteen to seventeen stock boards per minute. We have also sent one to the Rathbun Company, Deseronto, to put in to feed their heavy Circular Mills. They will also commend themselves for various other cases, especially for running Elevators, hoisting Engines, and wherever a simple and easily reversible motion is required.

We would also call attention to our Improved Hand Saw-Mill for cutting logs

☞*We guarantee this to be the best Mill of its kind got up, and would ask any one wanting a good Band Saw-Mill to communicate with us. We would also call the attention of Mill Men to our new IRON GANGS, CIRCULAR MILLS and MILL MACHINERY. For further information, prices, &c., address the Manufacturers,*

SOLID EMERY WHEELS

AND SHARPENING MACHINERY.

The products of the Manufacture of the Tanite Company have, for almost 18 years, enjoyed a great reputation, and have been recognized for a long while, in all the countries of the world as a type of excellence in this class of work. In order to increase in Canada their already widely extended use, the Co'y has recently added to the liberality of its terms and conditions, and has chosen the following Houses, so extensively known, to be its Agents:

BEAUDET & CHINIC } QUEBEC.
F. H. ANDREWS & SON }
G. A. PONTBRIANT . . SOREL.

MONTREAL SAW WORKS . . . .
MACHINERY SUPPLY ASSOCIATION } MONTREAL

VOL. 6. PETERBOROUGH, ONT., MARCH 1, 1886. NO. 5.

FORESTRY AND FOREST PRODUCTS.

The importance of "Forestry and Forest Products" is beginning to receive that recognition to which the subject is entitled. We have received from Mr. Douglas, the well-known bookseller of Edinburgh, a copy of a work recently published by him, bearing the title quoted above. The volume, edited by Messrs. John Rattray, M. A., B. Sc, and Hugh Robert Mill, B. Sc., is the result of the public spirit displayed by the promoters and managers of the Exhibition of Forestry held two years ago in Edinburgh. Prizes were offered by them for essays on matters connected with the science it was their purpose to illustrate and advance. Out of the material supplied by the successful competitors, the editors of this work have succeeded in producing one of the most valuable contributions to the literature of woodcraft, in all its ramifications, that perhaps was ever laid before the public. The volume is alike comprehensive and succinct, and will, when a few corrections have been made, undoubtedly come to be regarded as invaluable text-books by the students in that School of Forestry which, sooner or later must inevitably be established. The subjects dealt with are numerous and varied in their nature, and have deep interest not alone for botanists and experts in a knowledge of trees, but for those who are concerned in the development of the timber trade, and industries immediately connected with that important branch of commerce. The work comprises essays on the formation of nurseries and plantations, the utilization of forest products, the supply of timber, the ravages of forest insects, the present and prospective sources of the timber supplies of Great Britain, the growth of teak in India and Burmah; paper making from wood, and a "monograph" on the natural history and cultivation of the lacquer tree, by a Japanese gentleman who is chemist to the Imperial Geological Survey of his native land. Bearing in mind the fact that a Committee of the House of Commons has been appointed to collect facts and opinions, and that a scheme will probably be submitted to Parliament during the present session with a view to insure systematic instruction in scientific and practical forestry, it will be admitted that the appearance of this volume is singularly opportune.

With reference to the present and prospective sources of timber supplies of Great Britain, Mr. Robert Carrick, of Gefle, Sweden, has much to say in an elaborate essay on the subject. On one point of peculiar interest he observes:—

"Hewn and sawn yellow pine is a most valuable description of timber, and when of the finest grades is unrivalled for many purposes, such as house building and other wood-work. It has been largely and continously imported into this country for over fifty years, and a fully equivalent substitute will be difficult to find. The White Sea red wood approaches nearest to it in point of quality, but the latter, in addition to its smaller dimensions and greater knottiness, has other defects that diminish its value in comparison with the former. The quantity of hewn yellow pine received at the principal port from which we receive our supplies (viz., Quebec) was, in 1876, about 19,243,733 cubic feet, whereas, in 1883, it was but 11,108,557 cubic feet; or taking average for the years 1871 to 1875 inclusive, it exceeded 14,000,000 cubic feet per annum: while for the last five seasons, 1879 to 1883 inclusive, it was but 8,412,654 cubic feet. On the other hand the supply of yellow pine deals to Quebec has not decreased in so pronounced a manner, for although in 1876 it reached 278,363 loads, and only 147,979 loads in 1883, the average of the last five years was 187,187 loads, against 238,731 loads on an average for the five years ending with 1880. Such figures, in conjunction with the history of the quantity exported of late years, bear abundant evidence to the fact that a diminished quantity is available for export to Europe."

Another matter of the highest moment is dealt with in this essay. In discussing the duration of the yellow pine forests of Canada in relation to the timber supply of this country, the writer remarks:—

"The question is fast becoming one of but secondary importance to our timber consumers, as far as the lower qualities of the wood are concerned. In spite of the fact that prices have been steadily rising in Canada for the growing wood, and that a diminished supply has at the same time been brought to this country, the prices obtainable here at present, and for some years past heve left no commensurate profit to the exporters. The conclusion, therefore, to which a diminution in evport points is: that, except for a small quantity of prime yellow pine, a substitute for which cannot be found in Europe, Great Britain is economically unable to pay a price equivalent to what the United States can do, and must consequently be content to see the latter country intercepting an ever-increasing proportion of this fine wood. To make this clear, reference may be made to the attempt which was made in connection with the last census of the American Republic to ascertain the quantity of mature yellow pine then existent in that country and ready for the axe. Professor Sargent, who had charge of this part of the census, reported in 1882 in these words: 'The entire supply of white pine growing in the United States, and ready for axe, does not to-day greatly, if at all, exceed 80,000,000,000 feet; and this estimate includes the small and inferior trees which, a few years ago, would not have been considered worth counting. The annual production of this timber is not far from 10,000,000,000 feet, and the demand is constantly and rapidly increasing."

It is a reproach to the "Old Dominion" if the neglect of a due regard for the requirements of statistical science charged against the officials by Mr. Carrick, is really founded in fact. On this point he says:—

"As far as we are aware, no systematic attempt has been made by the Canadian authorities to reduce to figures the available quantities of mature spruce now growing in New Brunswick, Nova Scotia, and the immense forest belt before referred to, which lies between the Ottawa river basin in the west and Mingan in the east. All these districts, however, according to Mr. Joly, late Premier of the Province of Quebec, contain immense quantities of spruce, and it seems likely that there will be sufficient for many years' home consumption, unless it be swallowed up by the United States, after the people of that territory have used up all their own yellow pine and spruce."

In further support of the opinion expressed regarding the abundance of timber, the essayist observes:—

"The immense area of nearly primæval forest possessed by British Columbia must also be referred to, because, although not directly of importance to the timber consumers of this country, it will in the future doubtless relieve the North of Europe from what would otherwise become a very heavy demand from our fellow-subjects beneath the Southern Cross. That the requirements of Australia have already reached large proportions will be apparent from the fact that, with the exception of Great Britain, no country is now buying more Norwegian planed wood than the colonies of that continent. The most important tree in British Columbia is the Douglas fir."

It is gratifying to learn from an essay on "Paper Pulp from Wood, Straw and other Fibres, in the Past and Present," by Mr. W. J. Stonhill, of London, editor of the *Paper Trade Review*, there are grounds for believing that in British possessions where the cultivation of sugar no longer forms a profitable branch of industry, another is likely to supersede it. He says:—

"There is still a probability of the British sugar-growing possessions being of value as a field for the supply of paper stock. The fact that in 1884 capital is forthcoming to re-open the industry in Demerara—it failed in Jamaica—should remind the paper trade of the publicly expressed opinions of Thomas Routledge. In his early career, paper-makers were just as dubious concerning the possibilities of esparto, yet its advantages are admitted on all sides, and but for its very low price in 1883 many mills would never have been able to tide over the almost ruinous sudden advance in the cost of bleach. Fortunately esparto fell about £2 per ton (quoting from Ide and Christie's circular), equalizing £4 per ton of paper produced, whereas the increased cost of bleach per ton of paper was a shade less, even at the high 'scare price. This fact should induce paper-makers to be less reluctant to experiment in any direction where there is a large and regular supply fo neglected raw material containing a good fibre."

The economic aspect of the subject, has not been strongly dwelt upon by the writer, on the ground that it must be considered, when the question of the future staple material for paper comes under review. Mr. Stonhill's concluding remarks on this branch of industry, however, deserve careful attention:—

"If the British paper trade is not to suffer severely, many authorities assert that it will be necessary to fall back upon some raw material of home growth, which can be supplied cheaply and in any quantity. Straw, and straw only, meets the requirements of the case. By Lennings new chemical process for treating straw, the details of which are not made public, although its efficacy is vouched for by satisfactory authority, paper can be produced from straw which is hardly to be distinguished from that manufactured from cotton rags; and it can be made from about £12 a ton, not taking into account the saving produced by recovery of the chemicals employed. This process is now being adopted at a large Kentish mill, and if the published cost of manufacture be correct, it cannot be doubted that the system must introduce great and most beneficial changes in the British paper trade."

Further notice of this useful and compendious volume must stand over to a future day. Members of the timber trade, and the public at large, however, will gather from a perusal of the foregoing remarks upon, and extracts from, its pages, that the work is of considerable importance as an aid to the correct understanding of forestry in all its ramifications.—*Timber.*

Art and Design in Manufactures.

At the late meeting of the Dominion manufacturers' association it was decided to offer three silver medals for competition in the art schools of the Province, for the purpose of encouraging art design in relation to manufactures. At a meeting of the executive committee of the association, held yesterday afternoon, the schools and subjects were decided upon. The first medal will be given for competition among the students of the Toronto school of art and design; subject, best design in wall paper. The second medal will be offered to the Hamilton school of art and design; subject, best design of wrought-iron fence suitable for public buildings. The third medal will be offered to the London school of art and design; subject, best desgn of mantel and over mantel in wood.—*Tororto Mail.*

THE FIRST TRADE RETURNS OF THE NEW YEAR.

The Timber Trades Jaurnal of Feb. 13th says—Whatever our hopes, our wishes, and opinions in social life, in politics, or in trade, if the outside facts that bear upon them will not adapt themselves to our theories, we have only to reconcile our ideas to the facts, and make the best we can of them

It was a pleasant anticipation that the new year was to bring us a revival of business. The depression in trade was to run itself out with the termination of 1885; and even men of experience and authority did not refrain from committing themselfes publicly to the opinion that the dawn of a better day was already breaking ere Christmas was well over our heads. But what do we see now? Here are the Board of Trade returns for January before us, and they tell the same tale of retrogression that was related of every month last year. 1885 was a year of declining trade all through in comparison of '84, which itself was also a year of lessening business. But this January, in our over sea trade, is nearly £8,000,000 behind the January preceding. There is, however, one redeeming point in our estimation, and that is that the bulk of the falling away has been in the import department, which has receded in the past month to the extent of £6,685,966. In our exports, if we include foreign goods re-exported, the decrease is stated to be £1,181,637, total £7,867,603. Now, the average decrease per month, last year, in the value of our exports, amounted to nearly £1,700,000, so that there was an appreciable check to the rate of diminution at least to the extent of £500,000 last month, which is a sort of peg to hang a hope upon. And it is rather strengthened by the con-current circumstance that the volume of business done is almost as great as it was twelve months ago, but at a less valuation on account of the retrogression of prices; from which it may also be argued that, although the difference is chiefly taken from the the wages of the people, it does not necessarily follow that they are thereby thrown out of employment. If the same quantity of goods is turned out, the same labour, or nearly so, must be employed to produce them. The misfortune is that the workmen have to submit to smaller pay. Hence the strikes and lock-outs. When an employer finds that he is undersold in the market, though at his current price he is hardly, to use a homely phrase, "getting salt to his porridge," he has no alternative but to reduce his expenditure or to close his works, and the ready money outflow being that which pinches hardest, it is very naturally that which demands the first restraining hand.

A constantly dimishing banking account, where a less and less balance is found with every returning Monday morning, is a state of things that cannot be trifled with, and one of the best masters in the world, like that poor unfortunate Frenchman, M. Watrin, at Decazeville, the other day, may, in trying to save his firm from ruin by reducing the people's wages, become all at once as unpopular as if he had been a persecutor of them all his life long.

In 1884 and 1885 our oversea trade decreased by about £77,000,000, export and import together that is in two years. But last month it decreased by £7,867,603 which is at the rate of £94,000,000 for one year. So that to those who regard our imports as the best standard of prosperity this will be a severe shock, as five-sixths of the deficiency falls to the import department. On the other hand it may be fairly argued that a suspension of certain imports is a good ground for hope of a trade revival. When stocks here are allowed to run off before a general replenishing comes forward, a sharp reaction may be expected to occur, as the demand will then exceed the supply, and we can always get goods from abroad when we want them. But the decay of our export trade offers us no consolation of that sort. Foreign tariffs and foreign competition with our manufacturers are increasing as shown by the statistics, which are constantly coming forward in the daily papers and the leading class journals.

The importation of Spanish lead, for instance has almost annihilated that industry at home, as we learn from *Iron*, of last week, and now it seems they are sending hematite pig-iron into Staffordshire cheaper than it can be manufactured on the spot. They have long been accustomed to send the ore here, which is really good, and was used both in the Welsh and in the north-country iron works; but in a crude form of manufacture they now presume to dare our ironmasters to compete with them, and the result may be most disastrous to that important British industry. Not very long ago it will be remembered by buyers, that lead was worth over £20 per ton, and 30,000 people were said to be employed in our lead mines. But the Spaniards found by a few experiments that they could send their lead into England at a much less price, and do well by it, and the export from Spain to this country now is near 100,000 tons per annum. The most of our lead mines are consequently closed, while those remaining are said to be working without profit and employing but few people. It is true the price has come down to £12 15s., and the Spanish lead is offered at 10s. less. But, wherever the benefit of this reduction goes, the consumer shares very little of it, as the price of leaden pipes and fittings in the building trade appears to be very little reduced; so that a whole British industry is asserted to have been sacrificed for no appreciable benefit to the public at large. And the worst is that the iron trade is now threatened in much the same way, as the cases are precisely similar. For it is self-evident that if the Spanish ironmasters can offer rich hematite pig cheaper than the Cleveland masters, there is nothing to prevent them from turning that branch of the iron trade away from our mining districts, just as they have done with their lead.

We shall only remark on this topic that with so many people clamouring for employment among us, it must be well worth the careful study of our rulers to try and find how best such a state of things may be remedied, and that with as little delay as possible. The timber trade may have some trifling benefit from the cheapening of lead, but it is likely to be much more damaged by the ruin it has brought on a standard national industry.

To sum up the Board of Trade general returns, they amount to this: that our imports for January were valued at £25,501,930, as against £31,903,003 last year as same date; and our exports were to the amount of £17,212,781, against £18,109,525 in 1885.

Of the timber trade importation at this early period it is not customary to take much account, but as we have to exhibit the returns as they come out, a few words may not be inappropriate on introducing them.

The state of this interest for the past month, as regards importation, sympathizes with the general returns, in exhibiting a decrease in comparison of the same month in either of the two preceding years. But when we consider the sort of weather which has prevailed, we are more surprised that so much has come forward than so little. As customary at this period of the year, the arrivals of hewn timber exceed those of sawn and split, but altogether the quantity that came into the United Kingdom during January only amounted to 104,854 loads, against 135,903 last year, and 137,941 loads in 1884. Of staves there is some increase, but of mahogany, also, the quantity imported is smaller by several cargoes; and nothing has yet come forward to interfere to any appreciable extent with the stocks already in the hands of the dealers. The severity of the weather up to the present date is likely to put back the Norway spring trade by at least a fortnight, which will be favourable to the holders of stock at home, and is likely to enable them to get clear of their winter storage at fair prices before the shipping ports are in full business for the coming season.

The *role* is to furnish information from which our readers can draw their own conclusions. But the old precept may occasionally be suggested "It is good to make hay while the sun shines," and to part with your timber goods when you can get a fair profit on them, at all events, the chance is very likely to occur during this and the next month; but alter that the shrewdest calculator may find himself all at sea. No one can safely predict what turn the trade will take when all the ports of the Gulf of Bothnia and those of our Canadian possessions are clear of ice, and their shipping season fairly begun, which, from a trading point of view, may as yet be rather a remote contingency. But we may reasonably expect that there will be a good deal of business dong in Norway, and the lower ports of the Baltic, before May comes round. Let us hope that another month will exhibit the trade as visibly improving.

WEST'S Pain King works like a charm in relieving pain in the stomach, all bowel difficulties and cholera. No traveller should be without it. Should always be in the house. Cost but 25 cents. Sold by J. D. Tully, Druggist.

WHY WILL YOU cough when Shiloch's Cure will give give immediate relief Price 10 cts, 50 cts. and $1. For sale by Ormond & Walsh, druggists, Peterborough.

A CHANGE.

The circular announcing the retirement of Mr. Henry White Castle, from the old-established firm of Browning, Castle & Co., of Aldhurch Yark, is already in the hands of the rade, but will not take anybody by surprise, he contemplated dissolution having been known or some time past. Mr. Castle was connected rith the firm for the past 24 years, and has herefore established some claim to resign usiness duties after such a long spell of commercial activity. The retirement, however, be ond altering the title of the firm, which will in uture be Browning & Co., will bring about no ther change, the business being continued by he remaining partners in the usual way. These will be Mr. W. Browning, Mr. H. A. Mott, and Mr. J. G. Drummond. We understand the firm have already made their usual Quebec purchases, following the plan which luring the past few years they have adopted of ecuring large proportions of some of the leading stocks in Canada. We wish the firm under ts new arrangement every success, and hope hat the time will be favorable for them in the rosecution of their large and increasing trade. —*Timber Trades Journal.*

LUMBER LEFT OVER.

The *Lumbermuns' Gazette* says:—A statement of the amounts of lumber on hand, logs held over, logs put in 1884-5, the cut of 1885 and the intended cut of 1886, has been issued by E. S. Hotchkiss, secretary of the Lumber Manufacturer's Association of the Northwest. The figures, it is stated, were obtained from reports made by manufacturers only and supplemented by estimates in about a dozen instances, where reports could not be obtained from individuals. The secretary's statement says it is probable that 10 per cent. added for admissions would no more than cover the multitude of small operators from whom no reports were obtained, but in one instance, at least, his figures are greatly in excess of what they should be, He places the amount of lumber over in 1885 on the Saginaw river at an even 100,000,000 feet more than was reported by the manufacturers to the *Lumberman's Gazette* for the statement published January 6th, this year, and there is about the same excess in the amount for 1884. The amount of lumber reported on hand on the Saginaw river in 1884 was 449,000,000 feet, and the amount reported on hand at the close of 1885 was 329,000,000, including vmount sold, some 68,000,000 feet, and the amount held for the car trade, some 60,000,000 feet. We give the totals of the amount on hand in the different states of the northwest, for what they may be worth, hoping there is not such an excess at other points as on the Saginaw river:—

LUMBER CARRIED OVER.

	1884.	1885.
Michigan, lower Peninsula....	1,540,303,201	1,265,244,526
Michigan upper Peninsula....	101,028,201	143,655,800
Wisconsin	814,179,564	916,221,775
Minnesota	515,068,000	515,162,000
Iowa (Mississippi river).....	327,175,000	323,630,639
Illinois (Mississippi river)..	75,650,000	62,200,000
Missouri (Mississippi river).	57,000,000	99,000,000
Total.....	3,450,404,365	3,325,105,690

LOGS FOR 1886.

The statement gives the amounts of logs left over and the intended cut of 1886 at the various points, and suggests very properly that allowance must be made for the operations of outside parties who are not mill owners and have not reported. There are comparatively few of them in Michigan, but they abound in Wisconsin and Minnesota, and the Mississippi river mills depend upon such operations largely for their supplies. Following are the reports:—

	Logs over 1886.	Intended cut, 1886.
Michigan, lower peninsula.....	236,450,000	2,944,500,000
Michigan, upper peninsula	89,370,000	480,000,000
Wisconsin.....	281,333,000	1,511,950,000
Minnesota	55,684,800	535,523,300
Iowa mills (Mississippi river..	116,519,670	141,000,000
Illinois mills(Mississippi river..	27,845,231	26,000,000
Missouri Mills (Miss. river)..	12,070,480	24,500,000
Totals.....	819,273,206	5,561,473,300

The total amount of logs over in 1884 in the states named was 1,266,066,176.

LUMBER MANUFACTURED IN 1885.

The report of lumber and shingles manufactured in 1885 in the states named is undoubtedly somewhat below the total cut of the year. Many small mills exist at outside points the products of which can not well be obtained.

The report of Secretary Hotchkiss gives the following figures to which he suggests an addition of 10 per cent:—

	Lumber.	Shingles.
Michigan, lower peninsula....	2,985,493,097	2,350,627,000
Michigan, upper peninsula....	545,264,589	188,587,000
Wisconsin	1,884,814,753	1,051,604,350
Minnesota	882,053,908	338,573,080
Iowa	550,509,432	226,018,000
Illinois	134,200,000	29,689,750
Missouri	48,656,000	18,300,000
Total.....	7,030,901,779	4,203,399,180

MICHIGAN HARDWOODS.

It is a very common thing to find in the columns of the contemporary press, says the Michigan *Tradesman*, exhaustive articles deprecating the rapid destruction of the pine timber in northern Michigan, accompanied by startling statistics showing that, at the present rate of denudation the supply of pine will be practically exhausted in a few years. While in many instances these statistics and conclusions are very wide of the mark, there is pith in the main idea underlying them, and ample material for reflection. But the apostles of forestry in their eagerness to inveigh against the wholesale conversion of pine forests into lumber, too often overlook a species of waste which is infinitely more mischievous than the operations of the pine industry, viz., the waste of hardwoods by the logging operations of settlers. If this destruction were confined to legitimate lumbering processes the case would at least have mitigating features. But in many instances the waste is purely wanton; and wanton waste is under all circumstances to be deplored. The soil which grows hardwood timber is well known to be richer, and more perfectly suited for agricultural purposes, than that on which pine is commonly found. For this reason the hardwood lands suffer most severely from the hands of the settler. The fact that the ultimate value of Michigan hardwoods is but imperfectly, and not generally, understood, also favors the destruction. The average settler knows that the immediate revenue to be derived from his hardwood lands will be greater if he brings them under cultivation than if he leaves the forests inviolate; hence he proceeds to get rid of the timber as quickly as possible, by gathering into log-heaps and reducing it to ashes.

The exigencies of agriculture, of course, are not to be ignored. It is absolutely necessary that a certain proportion of the land should be cleared and placed under cultivation. But American farmers too often labor under the mistake that the measure of successful husbandry is in the area of land under tillage. Many of them have yet to learn that a small farm, well cultivated, may be made more profitable than a large faim carelessly cultivated; and that it would be true economy to clear a much smaller proportion of their hardwood lands than is customary, leaving the timber on the remainder to increase in value, as it will inevitably do in the near future.

Northern Michigan possesses magnificient possibilites (which can be realized if she husbands her resources) for the manufacture of hardwood products. Situated in the central portion of the vast northwest, between two great inland seas, which afford easy and cheap transportation to the markets both of the east and west, her facilities for the profitable disposal of her wares are all that can be desired. Her forests abound in an excellent variety of woods suitable for manufacture, and her numerous streams, flowing through the heart of the hardwood regions, afford cheap and abundant power for manufacturing purposes. In short, the natural advantages of northern Michigan for wood manufacture are unsurpassed, and only await the enlistment of extensive capita and enterprise to raise them to an important position. Already the good work has begun. Handle factories, bowl mills, spoke and hub factories, basket factories, etc, have been established at various points with favorable results. But the development of these industries is yet in an incipient stage. For the full realization of the manufacturing possibilities of northern Michigan, we must look to the future. A large proportion of the smaller class of articles manufactured from hardwoods, now comes from Maine and other New England states. There is no good reason why the markets of the west and northwest should not be supplied from the vast reserve of raw materials lying at their thresholds; and they certainly will be so supplied in the not distant future, if the settlers of northern Michigan do not, in the meantime, render such a result impracticable, by the wanton destruction of the vast tracts of forest wealth which are indispensable to the establishment of an extensive manufacturing system in the line of hardwood products.

MODERN LUMBERING.

A correspondent writing from Otsego Lake, Mich., to the Detroit *Free Press*, furnishes the following interesting account of lumbering operations thereabout:—

This place presents a sense of more than ordinary business activity this winter. Twenty-five lumber camps are in operation, the suppl es for which come here. There will be about 100,000,000 feet of logs "banked" by these 25 camps.

The extent of the lumber operations of Michigan are understood or appreciated by very few; what it means to be a lumberman at the present time differs materially from that of twenty, or even ten years ago. There is probable no business that has made more rapid advance or has seen greater improvements in the mode of operating than lumbering.

Only a few years ago the best pine standing away from a stream was of little value, the only method of marketing logs being the "drive" down the stream; now, railroading in connection with any large lumbering operation is considered a necessity and by this means the most remote tracts of pine are brought into the market.

A lumberman twenty years ago was a man who went into the woods in the early fall with a crew of men, rarely numbering 50, built his camps, surveyed and cut out his log-roads, leading to the inevitable stream where his logs were to be hauled and banked. These operations he superintended himself, often remaining in the woods the entire winter and only coming out with the drive at the mouth of the stream late in the spring. The logs were then turned over to the mill owner and either sawed on shares or purchased outright. The mill men and the lumbermen were as distinct a class as the farmer and the owner of the grist mill who ground his grain. It was necessary for the woodsmen simply to understand his part of the profession; the mill men then took the logs, manufactured the lumber and again turned over their product to the eastern dealer, who conducted the mercantile part of placing the lumber on sale.

Now, to be a successful lumberman, means that a man must have more requirements than for almost any other business. As nearly all heavy lumbering operations are conducted with a railroad, he must understand railroading. Several plants in this state are now operating from twenty to thirty miles of well constructed and ballasted track, with good rolling stock. He must be a thorough woodsman, for upon his own judgment of the quality and quantity of the pine it will yield he purchases large tracts of land. He must understand the river work, and know when his interests are properly served on the drives, and that his logs may not be hung-up ere the flood subsides. He owns his own mills; he must therefore be a mechanic mechinist, and as this is very important he must be a good one. He must be a navigator and a vessel owner, as after manufacturing his lumber he transports it in his own monster steam barges to his yards in the east. As he requires large quantities of supplies he raises them himself, and some of the model farms of Michigan are owned and conducted by the lumbermen. He is therefore a farmer. He must, furthermore, be a close observer of human nature, understanding and being able to control large bodies of men, for the heavy lumber firms of this state have in their employ from 500 to 1,500 men each. To control and manage them successfully requires a diplomat. How successfully this is done one illustration will show. Messrs. Henry Stephens & Co. are extensive lumbermen at St. Helen, Roscommon county. From one of the proprietors the following facts were obtained. There are at present employed 400 men. Of this number 150 have been in their employ over six years, 25 over 10 years, 15 over 15 years, 10 over 20 years, and five for over 30 years. In these days of change and dissatisfaction, strikes and lock-outs the above figures are indeed refreshing, and there are many other firms whose records would prove equally complimentary to employer and men.

There is no term that implies a greater knowledge of business methods, of a greater diversity and development of abilities, than the modern "lumberman."

MECHANISM OF A TREE.

A tree receives its nourishment from the roots. These correspond to the mouth in the human frame. Now, as in the human frame the nourishment received is, after being supplied to the blood, exposed to the operation of air in the lungs before it is fit to give material to the body; so in a tree, the nourishment taken in at these tree mouths, the roots, passes to the lungs of the tree, and there, by contact with the air, is rendered fit to supply fresh material to the tree. These tree lungs are the leaves. This operation is affected by the passage upward from the soil around the roots, through the trunk, the branches, and every twig of the tree to the leaves, of a large quantity of water, containing in solution the nutriment for the tree. Arrived at the leaves, a process takes place which separates, by means of contact with the air, the most of the water the roots had taken in from the valuable nutriment, and throws off, in vapor, the surplus water into the air. At this time certain constituent portions of the air are utilized and mingled with the nourishment retained. This is all, now a small portion in comparison with what had arisen from the roots, yet retaining enough water to serve as a vehicle back, returned towards the roots, depositing in its way, in leaf, bark and root, what is needed there for the growth of the tree. In these they undergo, especially in the bark, further fitting and digesting processes before they assimilate with the substance of the tree. The water which was retained to carry them down, being no longer needed, passes out at the roots. . . In the back of the leaf are numerous stomates or mouths. . . Of the extent of the provision made for evaporation by the leaves, some idea may be formed from a consideration of the number of stomata or stomates to be found in the leaves of plants. The number varies in different plants, for which variation a reason may be found in the different conditions of growth to which they are subjected in their several natural habitats. In the back of the leaf of the apple tree there are about twenty-four thousand stomates to the square inch. In the leaf of the lilac there are one hundred and sixty thousand of them to the square inch. In the leaves of the cherry laurel there are none on the upper surface of the leaf, but ninety thousand have been counted on the lower surface.—*Exchange.*

A Washington Treasury Decision.

WASHINGTON, Feb. 17.—The Treasury Department has declined to grant the request for permission either to resaw in bond certain lumber imported from Canada, or to export for a drawback, under 3,019 of the revised statutes the lumber re-sawed after the payment of the duty.

A MYSTERIOUS FIRE.

In a former article on the subject of lubricating machinery we refer to some of the villianous compounds that were sold under the name of lubricating oils. In this case only the damage to machinery was considered. This, however, is not all the danger that grows out of the use of those adulterations. Illuminating oils, with the adulterations that are put upon the market are still worse, for while only the damage to machinery may arise from the adultrations of lubricating oils, the danger to life and property from illuminating oils is still greater. The discovery of petroleum is no doubt one of the blessings of the present age, and when honestly and properly prepared, is the best for illuminating purposes of anything we have outside of gas, but the rascally mixture of benzine and other inflammable substances that are put upon the market is a fruitful cause of nine-tenths of the accidents that occur. A fellow with no character, knowledge or principal, goes into the oil trade ; his stock consists of a barrel of benzine, a barrel of kerosene oil, a few pounds of rosin or some other stuff to give it body, and then advertise a new illumiuating oil, made upon scientific principles, and warranted to give a brighter light and stand a high fire test, and no danger of explosion, etc., and cheaper than any oil ever put on the market. He will pour some of it into a shallow dish, and drop a burning match into it to satisfy his customers that it will not explode and in this way people are humbugged into buying a compound that is more dangerous than gunpowder.

It is well known to any who has given this subject any attention, that even clear benzine, when put into a hollow dish, will not explode ; it will burn rapidly, but is easily put out by throwing a cloth over it ; but when it is confined in a tight vessel, only partly filled, then is the time when it becomes dangerous, for the gas which it generates, from the volatile nature of it, soon fills the can, and if the cork is removed and it comes in contact with fire, it will explode like dynamite, and is about as dangerous to have it around. Even the best oil needs care, for it is impossible, with all the care that can be had in refining, to entirely deprive it of volatile matters, that will generate gas if left standing in a warm place. A lamp that has been used in the evening and stood over night, partly full of oil, should never be lighted in the morning without allowing the gas to escape. Blowing out lamps in the evening is another practice that should never be indulged in ; the air that is blown down the chimney is often forced down the tube, carrying the blaze with it, and if the oil should happen to be low, an explosion is likely to take place. The only safety is by buying nothing but the best, no matter about the price, a few cents on a gallon of oil is a small matter when compared to the destruction of life and property that almost every day occurs from the careless use of kerosene oil. Kindling the fire in the morning with kerosene is another practice that has cost many lives and a great destruction to property ; and if Bridget must light the fire with kerosene oil, by pouring it out of the can, impress upon her mind the oil must be poured upon the wood, and the can corked up and put away before the match is lighted. Kerosene oil is not the only element of danger that we have in our factories and dwellings to guard against. There are many other fruitful sources that are entirely overlooked, that cause most of the mysterious fires.

The careless use of matches is one constant source of danger ; not but which the matches may be harmless enough in themselves, if left alone, put when dropped upon the floor of a wood shop, covered with shavings, or in a barn where hay and straw is cattered about, if stepped on or picked up by mice, they become one of the sources of mysterious fires. It is well known that rats and mice will carry off matches for the phosphorus which they contain, and of which they seem to be fond ; but if one of them ignites while Mr. Rat is endeavoring to extract the phosphorus, he never stops to sound the alarm of fire, but takes himself off to some place of safety, and as no fire has been used in the building it is considered a clear case of incendiarism, but Mr. Rat is the last one to be suspected of being the incendiary. Spontaneous combustion is another cause of mysterious fires, that are put down as incendiary, but I believe that nine-tenths of them are from this cause.

That there are some fires that can be traced to incendiarism there is no doubt, but I am not willing to believe that mankind are so depraved as to be guilty of all the arts of incendiarism that are laid to their door.

Vapors arising from volatile matter take fire with less heat than many suppose. A steam pipe running through a box of pine saw dust has been known to take fire several times, and the heat of the steam was probably never over 300, the inflammable vapor that was destilled out of the turpentine contained in the saw dust furnished in the means of ignition.

Oily rags or cotton waste used around machinery, and saturated with oil, is another fruitful cause of mysterious fires, that occur where no fire is used. The statistics show that a great majority of the fires that take place in manufacturing establishments happen betwe en Saturday night and Monday morning, and as it is the custom in all well regulated mills to require the operatives to clean up their machines on Saturday afternoon, unless the oil waste used for that purpose is carefully collected and removed to some safe place, the chances are that before Sunday night, fire may be generated from spontaneous combustion.

In a discussion of this subject a few years ago in order to satisfy ourselves on this subject, we made a number of experments with different fibrous substances and oil. We found that cotton waste that had been used in cleaning machinery, and well saturated with oil, when covered up with iron turnings and dirt, which is found under the laths of all machine shops, took fire so as to smoke in two hours, and when partially uncovered and a portion of it is exposed to the air it burns up freely until the waste is all consumed. When saturated with linseed oil it took fire much sooner.

Some painters were at work in a house where a portion of the wood work was being finished in oil, and rags rubbing it were thrown into a closet. At noon, when all the workmen were absent to their dinner except one, who happened to have his dinner with him, and while sitting in the room adjoining the closet, discover smoke issuing from it. Upon opening the door he discovered the rags on fire, which blazed up lively, until the timely application of a few pails of water, which as good luck would have it were near at hand. The fire was extinguished with but little damage, whereas if the building had been left alone at the time, or the fire broke out at night, in all probability it would have been consumed, and another mysterious fire would have been recorded, "probably the work of an incandiary."

Another case of spontaneous ignition occurred in a store. A bottle of olive oil was spilled upon the floor, a quantity of saw dust was thrown over it to soak it up. The sun happened to be shining in upon it at the time, and in less than an hour it took fire.

In planing mills where the machinery is scarcely ever cleaned up, I will admit that there is little danger for greasy waste being thrown around, but there is an element that is quite as dangerous as waste. The fine dust that collects around and under the machines becomes saturated with oil and grease, together with the villainous compounds, under the name of lubricated oils, and as they scarcely ever are cleaned up they are only waiting for favorable conditions to develop into a first class fire.

The statistics of the insurance department in most states show the average time for planing mills, sash and door factories, furniture factories to burn in eight years ; while foundries, machine shops, black smith shops and other working establishments is about twenty. Now why is it so many wood-working establishments is burned up? There is no reason why a planing mill should burn any more than any other shop, if proper precaution is taken. It is true that there is a great deal of combustable matter in and around it, but even that is no good reason why they should burn up so often. With the improved devices for taking away the shavings and dust, a planing mill can be kept as clean as any other shop, and if the machines were brushed off and the accumulations of dust and grease scraped off every day there would be but little danger from that source.

Most of the mills that are built at the present time are well protected from fire, so far as the engine is concerned, with fire-proof shaving room, but with all the care that may be bestowed upon these two important parts of the mill unless proper precaution is taken to keep the machines free from those accumulations of of grease and dust, mysterious fires will still continue to break out when they are least expected, and planing mill owners will be obliged to continue to pay double the insurance which they ought to pay.—[*C. R. Tompkirs, M. E., in Journal of Progress.*

NORTHWESTERN ONTARIO.

Year by year the operations of the lumbermen in Muskoka are becoming less and the pine limits are decreasing or rapidly disappearing.—*Herald.*

A man named Dennis, of Detroit, has taken his mill machinery to Lynch Lake, Joly township, where he intends cutting birch lumber for the Toronto market. He will ship by the N. & P. J. R.

Two large saw mills are to be built on Casselman's farm, near Katrine, to cut lumber for the firm of Flatt & Bradley. The pine around Doe Lake is said to be sufficient to last twenty years—if not too rapidly consumed.

Messrs. R. & G. Strickland, of Lakefield, are carrying on a large lumbering business in Oakley this winter. They have four camps in operation in which forty-four teams are employed ; in the one camp alone—that of which James Taylor is foreman—there are nineteen teams. The depot for supplies is Wood Lake camp, presided over by Mr. R. Kail. Mr. Alex. Moffatt, their managing clerk, lives here, and fills the position to the entire satisfaction of the company. Mr. Ketching, of Draper, has the contract for supplying the above camp with oats, pork, flower and other provisions. Mr. Jackson Foster is engaged to assist Mr. Ketching in teaming in the supplies from Gravenhurst.—*Banner.*

Mr. Martin, the timber and lumber inspector for the N. & P. J., returns next week from Bracebridge and Huntsville, where he has been looking after the erection of the fine station buildings nearly completed at those points, to lay out the work for the Burk's Fall's station.—*Arrow.*

"What Say You to a Piece of Roast Reef and Mustard?"

Well, there is much to be said. The question being asked of the banqueter at the average boarding house, calls up reminiscences of close contiguity to the horns, and beefsteak three cuts south thereof. He, of course, will pass unless it occurs to him that he needs a hinge for his trunk. Should there be any suffering the effects of an indulgence in such sinuous fare, use McGregor's Speedy Cure, a sure and effectual remedy for dyspepsia, constipation and affections of the stomach and liver. Sold by J. McKee. Trial bottles free.

Advice to Mothers.

Mrs. Winslow's Soothing Syrup should always be used when children are cutting teeth. It relieves the little sufferer at once ; it produces natural, quiet sleep by relieving the child from pain, and the little cherub awakes as "bright as a button." It is very pleasant to taste. It soothes the child, softens the gums, allays all pain, relieves wind, regulates the bowels, and is the best known remedy for diarrhoea, whether arising from teething or other causes. 25 cts a bottle. Be sure and ask for "Mrs. Winslow's Soothing Syrup," and take no other kind.

Perhaps the most extraordinary that success has been achieved in modern science has been attained by the Dixon treatment for Catarrh Out of 2,000 patients treated during the past six months, fully ninety per cent. have been cured of this stubborn malady. This is none the less startling when it is remembered that not five per cent. of the patients presenting themselves to the regular practitioner are benefitted, while the patent medicines and other advertised cures never record a cure at all. Starting with the claim now generally believed by the most scientific men that the disease is due to the presence of living parasites in the tissues, Mr. Dixon at once adapted his cure to their extermination ; this accomplished the Catarrh is practically cured, and the permanency is unquestioned, as cures effected by him four years ago are cures still. No one else has ever attempted to cure Catarrh in this manner, and no other treatment has ever cured Catarrh. The application of the remedy is simple and can be done at home, and the present season of the year is the most favorable for a speedy and permanent cure, the majority of cases being cured at one treatment. Sufferers should correspond with Messrs. A. H. DIXON & SON, 305 King street west, Toronto, Canada, and enclose a stamp for their treatise on Catarrh.—*Montreal Star.* 1y122.

Advertisements intended for insertion in any particular issue should reach the office of publication at least four clear days before the day of publication, to insure insertion.

All communications, orders and remittances should be addressed and made payable to THE PETERBOROUGH REVIEW PRINTING AND PUBLISHING COMPANY (LIMITED), Peterborough, Ont.

Communications intended for insertion in the CANADA LUMBERMAN, must be accompanied by the name of the writer, not necessarily for publication, but as a guarantee of good faith. Communications to insure insertion (if accepted) in the following number, should be in the hands of the publishers a week before the date of the next issue.

The CANADA LUMBERMAN is filed at the Offices of MESSRS SAMUEL DEACON & Co., 154 Leadenhall Street, London, England, who also receive advertisements and subscriptions for this paper.

PETERBOROUGH, Ont, MAR. 1, 1886.

THE Chicago & Grand Trunk railway recently purchased of White & Henener, Lapees, Mich., 15,000 feet of choice black walnut lumber, and shipped it to Port Huron for use in car building.

THE William Hamilton Manufacturing Company, of Peterborough, has ready for shipment to the Royal Planing Mill Company, of New Westminister, British Columbia, two mills and one engine, ordered January 11th. The boilers are 42 inches in diameter and the engine 16x20. It is also filling an order from New York state for saws.

LUMBER men report, according the Kingston *News*, that the quantity of railway ties taken out along the line of the Kingston and Pembroke railway, this season, has been very large, while considerably less hemlock lumber has been cut this year than last. Cedar posts are a drug upon the market, as the supply greatly exceeds the demand.

BEAUCE, P. Q., lumberers complain of the absence of sufficient snow for their operations. The following are the approximate numbers of saw-logs that are being taken out this winter on the Chaudiere river and its tributaries:—Mr. John Breakey, 200,000; Mr. Hall, 100,000; Mr. Crawford, 100,000; Mr. Cahill, 30,000; Mr. A. Beaulieu, 30,000; total, 460,000.

THE last issue of the London *Economist* notices among new companies in Britain, Miller's Tanning Extract Co., Limited.—Issue of 8,000 shares of £10 each, of which 2,000 shares, fully paid, are allotted to the vendors. This company is formed to acquire and extend the business of Messrs. J. & J. Miller & Co., the inventors and original makers of tanning extracts. The price to be paid for the business, &c., is £41,750, of which £20,000 is represented by paid up shares.

A TELEGRAM from Duluth, on Lake Superior, states that the Duluth Lumber Company has contracted to ship 30,000,000 feet of lumber to Chicago by lake, most of which is to find a west and southwest market. The roads west and southwest of Chicago are to give rebate enough to pay for the lake freight from Duluth to Chicago, thus depriving the railroads leading southwest from St. Paul from getting this business with the high tariff. Last year 5,000,000 feet of lumber was shipped from Duluth to Saginaw by water and nearly 1,000,000 bushels of wheat to Milwaukee.

CAN England produce good axes? This seems to be a question over which there is some dispute. A correspondent of the *Ironmonger* recently critizes severely those of English make, and is somewhat curious to know what American manufacturers would think of having five-twelfths of their product returned as worthless. One of the English journals thinks that the case is not so bad as stated in the *Ironnonger*, and that their tool makers and inventors need only know that a strong and perfect axe is wanted for the Colonial market, for which a higher price than the average one will be paid, to set themselves to work to take the wind out of the sails of their American cousins.

THE Bobcaygeon *Independent* says:—Mr. J. M. Irwin, lumberman, has had trouble with diphtheria. And one of his shanties near Haliburton, a man became ill, and went home. The report was circulated that he had diphtheria and though it was afterwards proven that it was not, a scare took possession of the shanty and a number of men and teams left. As the men and teams left without notice, and as Mr. Irwin considered without sufficent cause, and demoralised the shanty, he declined to pay them. Timothy Crowley and some others entered action against Mr. Irwin at Peterboro. An arrangement was arrvied at with all except Crowley and the magistrate dismissed the cases with the exception of Crowleys. This is yet to be heard as time is required to obtain witnesses. His claim is for $40. [This case is also withdrawn.]

THE SALE OF TIMBER.

The following table shows the amount and value of the timber sold at the office of the Quebec Provincial Government during the past year:—

	Lots.	Price.
January	11,159	$ 9,335 00
February	11,122	8,767 00
March	12,783	11,028 90
April	11,678	9,777 10
May	11,441	10,231 30
June	11,203	9,339 30
July	7,479	5,382 20
August	7,879	55,444 80
September	13,940	11,750 30
October	14,281	10,076 00
November	12,712	10,629 90
December	11,881	9,840 20
Total	137,558	$112,601 50

THE EXPORT DUTY.

THE removal of the United States import duty on lumber is still so remote a contingency that the question of increasing the export duty on logs has not lost interest, and may still be considered apart from the contengency referred to. The Ottawa *Free Press*, having interviewed the Commissioner of Customs, returns to the subject. It represents the Commissioner, in the interview, as saying that it was almost impossible to collect the export duty. The *Free Press* drops its former contentions entirely, and wisely does so, and relies now altogether upon the alleged difficulty of collecting the duty.

The chief difficulty—the one on which greatest stress is laid—is thus stated by the *Free Press*:—

"Until the lumber crosses the line of demarcation it is in Canndian territory, and cannot be held for duty, so that the service of collecting this duty if strickly followed up would be far in excess of what could be collected."

If the logs could not be held for duty until they were into the centre of the lake, and there was no other remedy, the difficulty would be great. But has it not occurred to the *Free Press* that vessels going to the Uuited States are required to take out clearances, and that the regulations is inforced? The United States lumbermen who export logs from Canadian territory are owners of limits in Canada, and, were the Government to take up the matter earnestly, a way would be found of enforcing the law, and of compelling them to respect the laws of this country. The small quantity of logs that have heretofore been exported was not of sufficent importance to attract a great deal of attention, and the export duty may not have been enforced as it should have been. If the Commissioner is correctly reported in the *Free Press* it has not been. But when logs are exported wholesale, and Canadian lumbermen are placed at a disadvantage in their own country, to the advantage of foreigners; and when the country is losing largely through another country receiving the benefits connected with the manufacturing of her logs into lumber, the matter can no longer be ignored and it becomes of such importance that it merits the most careful at tention of our rulers.

Since writing the above we have received a communication from the Customs Department, in answer to a letter sent there, which puts a different face on the alleged interview and makes the alleged difficulty in collecting the export duty simply an idea of the *Free Press*.

The letter concludes as follows:—

"As respects the export duty, I can only say that is the law is to collect the same at one dollar per thousand feet upon all logs of pine or spruce, and that the officers of Customs have the most particular instructions with reference to this as well as all other duties; and I have no reason to suppose that its collection will be neglected by any of them under whose survey the exportation may take place."

This is sufficently explicit, as we have pointed out above, the collection of the duty is not as impossibility by any means, and it is absurd to suppose that the Customs Department would neglect to carry out the law. The objections urged against the increase asked for are very weak, and the arguments in its favor are strong and indisputable.

THE MORRISON BILL.

THE bill which Mr. Morrison has introduced into the United States Congress to change the tariff rates on many articles going into that country has attracted a great deal of attention. In the first place it is very doubtful if the bill will become law. It will take a hard fight to pass it through the House of Representatives, and if it is not strangled there it will have then to be passed through the Senate, with it Republican majority.

If this bill is not adopted by the American Congress, there will, for some time, be little hope of a reciprocity treaty between Canada and the States. It does not go so far as a comprehensive reciprocity treaty would go, and if its provisions are not acceptable a reciprocity treaty that would be beneficial to Canada would scarcely be accepted by them. And the proposition of the President to appoint a Commission to consider the fishery question and reciprocity, appears to meet with disfavor.

The part of the Morrison bill that our readers will be interested the most in is its provision for placing certain kinds of lumber on the free list. The telegraphic summaries of the bill led us at first to believe that all kinds of lumber were, if this bill was adopted, to be placed on the free list, the only proviso being that countries which levied an export duty should not be included. If this was the scope of the mill—and it may be the intention of its promoters—Canada would scarcely hesitate to remove the export duty on logs and thus reciprocate with our neighbors. It might be feared that the removal of the duties would tend to the depletion of our timber resources, but the benefits to be derived from the removal of the duties, thus freeing the trade from restriction, and increasing the value of the timber, would be of such a character that our Government and people would undoubtedly consent to the proviso.

Fuller particulars regarding the proposed changes, however, appear to show that they are not of such a character as to be so interesting to Canada as was at first supposed. Mr. Wm. Little, of Montreal, takes this view of the bill and writes:—

"We were led to expect would place pine and spruce lumber on the free list, but should the bill pass in its present shape the only kinds of lumber made free are those specially mentioned—hemlock, whitewood, sycamore and basswood—which now pay a duty of a dollar per 1,000 feet, board measure, or half the duty levied on pine and spruce.

"The first line of the bill leaves the impression that the intention is to have lumber hewn and sawed free; but this applies only to lumber and timber used for spars and in building wharves. The words hewn and sawn are simply descriptive of the lumber so to be used.

"A subsequent paragraph mentions the particular kinds of lumber that are to be free, viz, sawed boards, plank deals and other lumber of hemlock, whitewood, sycamore and basswood, and all other *articles* (not kinds) of sawed lumber.

"The only sawn articles in pine and spruce to be free are specially mentioned, such as clapboards, pickets, palings, lath, and shingles.

"This intention of the bill is clearly shown by a charge of 50 cents per 1,000 feet for each side planed or finished of all articles made from the particular kinds of lumber specified—hemlock, whitewood, sycamore and basswood.

"So that as regards Canadian lumber, the bill will have no effect whatever, but to give free admission to the limited amount of hemlock now going to the U. S., the other woods—whitewood, sycamore and basswood—not being produced in Canada in excess of home requirements."

The Montreal *Herald* believes, from the wording, that the intention was to include pine and spruce, but the bill, as reported by the newspapers, does certainly appear to sustain Mr. Little's construction of it. If the bill becomes law, it is to be hoped that its intention will be made plain, but if Mr. Little's view is correct, even if it does become law, in its present shape, it will not be of great importance to Canadian lumbermen, although it will be a step in the right direction, inasmuch as hemlock, shingles, etc., will be placed on the free list.

LUMBER DEALERS AND RAILWAYS.

To the Editor of the Canada Lumberman.

SIR,—Had the Toronto lumber dealers no means of knowing the season of the year the railroad officials would supply the information. No sooner do storms prevail than cars are weighed and excess charges from 60 cents to $10.00 each car are presented to dealers.

These charges are something positively apalling. The mere sight of a freight advice note, ornamented with red ink figures, causes the dealer to sigh deeply as he sees all the profit on the car load gone at one fell swoop.

It is beyond the ken of ordinary mortals how the charges are made. True, the gross weight is given, tare deducted, and the net weight, claimed to be the actual weight of the lumber, stands forth in all its immensity. To compare these freight advice notes will show the most glaring variations in the weight of lumber.

Permit us to present a few of these with their sanguinary figures:

1.	Gross	53,800 lbs.
	Tare	18,000 "
	Net	35,800 "
	Amount on car	10,000 ft.
2.	Gross	62,000 lbs.
	Tare	18,000 "
	Net	44,000 "
	Amunto on car	10,704 ft.
3.	Gross	56,600 lbs.
	Tare	18,400 "
	Net	38,200 "
	Amount on car	10,610 ft.
4.	Gross	46,000 lbs.
	Tare	17,800 "
	Net	28,200 "
	Amount on car	10,021 ft.
5.	Gross	45,800 lbs.

Tare	17,200	"
Net	28,600	"
Amount on car	10,097	ft.
6. Gross	53,000	lbs.
Tare	18,000	"
Net	35,000	"
Amount on car	10,084	ft.
7. Gross	56,000	lbs.
Tare	16,000	"
Net	40,000	"
Amount on car	10,016	ft.
8. Gross	58,000	lbs.
Tare	18,000	"
Net	40,000	"
Amount on car	10,046	"

So far as the above cars are concerned there is no deduction appearing on the notes for snow and ice. The lumber with which these cars were loaded is white pine, cut about sx months, and piled to dry, everything being practically equal with regard to these car loads.

It will be seen that the lowest weight of the lumber on the above cars is about 35.75 lbs. to cubic foot and the greatest is 48.75 lbs. to cubic foot, showing a difference of 15 lbs. to a cubic foot.

The quantity of ice and snow brought down on cars loaded with lumber is not correctly estimated, nor are the employes of the railroad qualified to judge, at a glance, of the weight of the snow and ice, and never make any allowance for the amount of moisture absorbed by the lumber, a very important item in the weighing of lumber.

What does an inch of ice on the car imply? It means that the lumber dealer has to pay an increased rate. Ice one inch thick, covering a car 8x30 ft., weighs about 1,160 pounds; snow packed as is found on flats, same sized car, weighs about 620 lbs.; snow as it falls, same dimensions, about 270 lbs.

Let an impartial person examine a flat car and he will find from 1½ to 3 in. of closely packed snow and ice. Take into consideration the snow on top of the lumber with that which is lying in the centre, between the two lengths of lumber as well as that on the ends, and there will be found a weight not by any means covered by the allowance sometimes made.

An estimate made from actual measurement of several cars give an average depth of snow and ice to be about 2 in. and of snow on top about 4 in.

Take the average weight of the packed snow and ice, allowing the snow to be ⅔ and the ice ½ covering a flat car, we have a weight of about 1,572 lbs. Again, taking the snow on top, centre and ends, we have another weight of about 1,080 lbs., or a total weight of about 2,652 lbs.

The length of time intervening between date of shipment and that of arrival is anywhere from three days to two weeks, during which the lumber is exposed to all the variations of temperature. The melting snow or rain finds its way between the courses of the lumber, by which a very considerable amount is absorbed.

The quantity of fluids absorbed by white pine, partially dry, is about 25 per cent. of its weight. Taking the weight to be 32 lbs. per cubic foot, by exposure to rain, etc., the weight will increase to 40 lbs., or equivalent to a car oaded with 10,000 feet, weighing about 34,000 lbs., instead of nearly 27,000 lbs.

The railroad authorities make no allowance but compel the dealer to pay excess charges on the amount of moisture absorbed by the lumber, which in the majority of cases has been caused by their neglect or inability to forward the lumber in a reasonable time.

Their is not that consideration shown to the dealers by railroads which is their due. From the nature of their business their goods are exposed to all the changes of weather, and it is manifestly unfair to take advantage of effects produced by causes beyond the control of the lumberman.

The lumber, when loaded, may weigh no more than 25,000 or 26,000 lbs., excepting in rare cases it never goes over, as no dealer will place green lumber on the market for obvious reasons, but through no fault of either seller or buyer, by the time it has reached its destination the weight is increased by 4,000 to 6,000 lbs.

There are many other greviance existing in the present unsatisfactory relations between the lumbermen and railroads. It is about time that our manufacturers and dealers combined to form an association in self-defence.

The railroad companies dealing with the lumberman individually can, and do, compel him to pay excessive charges, or throw away 2 or 3 days in attempting to obtain a reduction. On the other hand, were they united, the railroad officials would be much more inclined to moderate their charges, and, on proper representation of the actual state of affairs, would no doubt come to some understanding as to the quantity, *in feet*, of what constitutes a car load of lumber, thereby enabling the dealer to know the exact amount of their freight bills.

The great injustice in charging by weight lies in the fact that the lumber is weighed at the point of arrival instead of that of departure.

The writer trusts he has not encroached too much on your valuable space, nor on the patience of your readers.

Toronto, Feb. 22nd, 1886. LUMBER.

THE LUMBER DUTIES.

To the Editor of the Canada Lumberman.

SIR,—It is highly gratifying to see the press of this country almost unanimous in advising the country to adopt the very sensible suggestion of the Hon. H. G. Joly, of raising the export duty on saw logs to at least that of the duty imposed by the United States on sawn lumber, otherwise we had better remove our mills across the line, the comments of the Hamilton *Spectator* on this subject as published in the LUMBERMAN, being especially commendable.

Of course no one that knows anything about the subject anticipates a removal of United States duties from pine and spruce lumber, till the lumbermen of that country have at least bought up sufficient Canadian pine and spruce timber to make it to their interest to allow their Government to throw off the duty.

Even should Congress pass a measure with this end in view, it would be tricked out of its intent by their hirlings in Washington before it became a law.

Knowing the men and the means they would adopt to thwart any attempt at a removal of the duty from pine and spruce lumber, I was fully prepared to find, notwithstanding the Hon. Mr. Morrison's spirited speech last year on the subject, and the almost unanimous desire on the part of the press and people of the United States for free lumber, that unless he was especially careful he would be tricked into proposing a measure that did not apply to pine or spruce lumber at all; and such I find to be the case, he proposed bill not affecting any Canadian lumber but hemlock, which is placed on the free list, while pine and spruce are to be still subject to a duty of $2 per M feet as heretofore, being included in the clause which will still remain on the tariff, not having been repealed under the heading of "boards, planks, deals, and lumber sawed from other varieties of wood not elsewhere specified," and if you will examine the existing U. S. tariff and note what additions only are made to the list you will see that my conclusions are correct.

To show to what a length the tools of the lumbermen will go to satisfy their patrons, it is only necessary to revert to the bill proposed by the late Hon. Fernando Wood in 1878, putting a duty of $1 per M feet on pine, spruce and other sawn lumber, which appeared, when ready for passage, in these words: "Lumber of hemlock pine, whitewood, sycamore and basswood, $1 per M ft., board measure," spruce having been dropped, and the comma omitted between hemlock and pine, so that if the bill passed, they could insist it was *hemlock pine*, and not *white* or *red* pine that was placed at the reduced rate of duty.

It is to be hoped, however, that the answers to the enquiries made by the Committee of the Statistician, as to what extent the proposed changes would effect the existing tariff, will plainly show the fact that, as regards Canadian lumber, the proposed additions to the free list only effect hemlock. The other kinds mentioned, whitewood, sycamore and basswood being mere surplusage, as little or no lumber of these kinds of wood is imported into the United States, and that pine and spruce lumber are still subject to the existing tariff of $2 per M feet, board measure.

WILLIAM LITTLE.

Forestry Chambers, Montreal, Feb. 25, 1886.

WOOD-WORKING PATENTS.

The following list of patents relating to the wood-working interests, granted by the United States Patent Office, February 16th, 1886, is specially reported by Franklyn H. Hough, solicitor of American and Foreign patents, 925 F. Street, N. W., Washington, D. C.

336,782—Edger, gang—E. H. Barnes, Brooklyn, N. Y.

336,813—Lathe for turning irregular forms—O. Kromer, Sandusky, Ohio.

336,674—Plane—J. A. Traut, New Britain, Conn.

336,697—Saw—C. N. Clemson, Middleton, N. Y.

336,739—Saw—J. J. Parker, Aitkin, Minn.

336,661—Saw hanging—T. W. Peck, Milwaukee, Wis.

336,671—Saw mill head blocks, nose guard for—C. Esplin, Minneapolis, Minn.

336,693—Sawing machine, band—J. J. Bowen, San Francisco, Cal.

PATENTS ISSUED FEB. 16.

336,193—Edger and cant sawing machine—W. M. Wilkin, Erie, Pa.

336,511—Lumber drier—J. J. Curran, Chicago, Ill.

336,222—Edge guard for planes—J. H. Ferguson, Brooklyn, N. Y.

336,500—Re-sawing machine—G. Tintle, Newark, N. J.

336,380—Saw—A. Bertram, Toronto, Ontario, Canada.

336,208—Saw and lathe combined—F. J. Buckner, New York, N. Y.

335,407—Saw mill, band—F. M. Hanks, & H. N. Sibley, Midway, La.

336,194—Saw mill dog—W. H. Wilkin, Erie, Pa.

OTTAWA EXCITED,

Aocording to the news columns of the Ottawa *Journal*, the capital seems to expect the Morrison bill to become law. We fear the *Journal* has allowed itself to become unduly excited in the following:—

"It is confidently expected here by lumber merchants that the duty on lumber will be removed at the present session of the Congress.

"The abolition of the present duty will result in the introduction of the Canadian mill owners as a factor in the American dressed lumber market, to be detriment of thousands of smaller American dealers who procure lumber in an undressed state in Ottawa. The extensive lumbermen here propose to manufacture dressed lumber here on an enormous scale and several of them are already talking of adding the necessary machinery to their sespective mills. Messrs Bronton & Weston have already commenced to cut a tail-race, while a number of other manufacturers are about to follow their example. It is intended to manufacture dressed lumber of every grade, from the heavy stick of square timber, down to plane boards, and window sashes for which there is a growing demand across the lines. The proposed planing mills, according to the present intentions, will be run the year round, giving employment all winter to at least one thousand men otherwise obliged to go to distant shanties. The advantage that will be derived from the adoption of the measure by Congress can not be overestimated. An appreciaable feature of the shipment in dressed lumber, will be to accomplish a considerable saving, owing to the removal of the shavings. The frieght rates will also be proportionately reduced, as fifteen hundred feet of prepared lumber will be equivelent to the space occupied by one thousann feet of lumber in its undressed state.

"It is expected that next summer there will be considerable decrease in the output of the mills at Whitehall, Vt., Richford, Vt., and Burlington, Vt."

The Greatest Preparation Yet.

"Eureka," Dorenwend's world renowned Hair Destroyer, destroys all superfluous hair on the face or arms of Ladies or Gentlemen. It is harmless, causes no pain in using, and leaves no disfigurements; can be easily applied, and works quickly and surely. Thousands have used it and pronounce it to be the best article of the kind before the public. To be had from J. D. Tully, Druggist, agent for Peterborough.

FOR SALE

VALUABLE

Timber Limits

AND

50,000 SAW LOGS

ON SEVERN RIVER

The undersigned being desirous of confining their operations to their Lakefield Mills on the Trent waters, offer for sale the following limits:—

Township of Hindou, 70 square miles.
" Oakley, 45 " "
" Redout, 22 " "

An area of 137 square miles.

These limits are estimated to contain 180 million feet of Logs, well watered, and afford means of short hauling from all points, and quick and cheap driving to Georgian Bay. Are offered for sale together with plant, depots farms, 1,200 acres deeded lands and 50,000 logs, nearly all of which are on the main river, a large proportion of which are 16 feet long. Apply to

R. & G. Strickland,

3mL LAKEFIELD, ONT.

Welland Canal Enlargement.

NOTICE TO CONTRACTORS.

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for the Welland Canal," will be received at this office, from mechanical, skilled, practical contractors, until the arrival of the Eastern and Western mails on TUESDAY, the NINTH day of MARCH next, for raising the walls of the locks, weirs, &c., and increasing the height of the banks of that part of the Welland Canal between Port Dalhousie and Thorold.

The works throughout will be let in sections.

A map showing the different places, together with plans and descriptive specifications, can be seen at this office on and after Tuesday, the 23rd February instant, where printed forms can be obtained. A like class of information relative to the works will be supplied at the Resident Engineer's Office, Thorold.

Parties tendering are requested to examine the locality and bear in mind that the season and circumstances under which the works have to be done render some of them of an exceptional nature.

Tenders will not be considered unless made strictly in accordance with printed forms and, in the case of firms, except there are attached the actual signatures, the nature of occupation, and place of residence of each member of the same; and further, a *bank deposit receipt* for the sum of *Two Thousand Dollars* or more according to the extent of the work on the section—must accompany the respective tenders, which sum shall be forfeited if the party tendering declines entering into contract for the work at the rates of prices stated in the offer submitted. The amount required in each case will be stated on the tender.

The deposit receipts thus sent in will be returned to the respective parties whose tenders are not accepted.

This Department does not, however, bind itself to accept the lowest or any tender.

By order.

A. P. BRADLEY,
Secretary.

Department of Railway & Canals,
Ottawa, 17th February, 1886. 2d45

PROFITS IN THE LONDON TIMBER TRADE.

Dealing in lumber after the English method appears to be a very profitab e business, judging by the promises of the scheme of organization of two timber corporations which have recently been formed in London. The particulars of the organization of Powis, Bryant & Powis, limited, under the companies act, were given some weeks ago. The capital stock was £200,000 ($1,000,000) divided into 200,000 shares at £1 ($5) each. One of the inducements to invest was the promise (implied, at least) that the shareholders would receive a dividend of 10 per cent each. year. This enterprise has been followed by another, namely the incorporation of William Oliver & Sons, limited, on a similar basis. The house is old one in the timber trade. The prospectus states that "the company is formed for the purpose of acquiring and still further developing the lucrative business of Wm. Oliver & Sons, mahogany, wainscot, timber merchants and importers, and dealers in every kind of wood in use, which has been carried on in London for two generations and has now a world-wide reputation." The capital stock of the proposed company is £200,000 ($1,000,000) in 200.000 shares at £1 ($5) each. Of this amount 175,000 shares are offered to the public at the premium of 10s. ($2.50) per share, the vendors taking the remaining shares in part payment of their good will. etc. The directors are Thomas Oliver, Harry Webb, Joseph Aldridge Oliver and Edward Aldridge Oliver, who will have power to add to their number. The vendors are Edward Aldridge Oliver and Thomas Oliver who transfer to the company their stock in trade as valued by them at the ordinary stocktaking purpose of the firm and he sum so ascertained will be paid by the company, with interest thereon at five per cent per annum until paid. The good will, leases, appliances, plant, etc., will be transferred for the 25,000 shares, as fully paid up shares, together with £75,000, being the proceeds of 50,000 of the shares offered for public subscription. The premiums on the remaining 125,000 shares will belong to the company.

The lucrative character of the business will be inferred from the statement that "for three years the vendors guarantee a dividend of 10 per cent. per annum on the paid up share capital of the first or present issue of $200,000, it being understood that the surplus over 10 per cent in any year is to be credited as against the guarantee of the following or preceding year. The vendors will deposit securities to be approved by the company's brokers to the value of £30,000 with the company's bankers as a running security for the due performance of their guarantee." What American corporation dare undertake to have a dividend of 10 per cent. per annum on its capital stock and put up the bonds to secure the payment! The vendors undertake not to receive during the first three years any remuneration whatever for their services until the shareholders have received 10 per cent. on the paid up share capital. This promise seems superfluous in view of the deposits of bonds to secure the payment, but the security would be devoured should there be a failure for more than one year to pay the dividend.

Northwestern manufacturers of lumber (American) are suspected of making more than 10 per cent. profit, but they are those who have purchased the timber lands and get their stock from the stump. American lumber dealers generally would be well pleased, we believe, with a guarantee of ten per cent. dividend on the capital invested. The impression we have of England is of a land where money is cheap and the people satisfied with small profits, but that must be a mistaken notion if the profits in the English timber trade afford a fair sample of the earnings of capital invested in trade over there.—*Lumberman's Gazette.*

The *Forester* says:—We learn that the timber in the townships to the east of Huntsville, which as yet has never been tapped by the lumbermen's axe, is likely to be put on the market by the Ontario Government next year. Already several lumber firms have had men ranging through the bush spying out the best limits.

THE CHEAP AND THE DEAR SELLER.

It is not the first law of economics that the cheap seller will supersede the dear seller and get all his market away? Certainly that is true in the long run, but is not true in five minutes. The difficulties in the way of the "undercutter" or underseller are very great indeed. In the first place "the trade" hate him, and the hatred of the trade is unpleasant—good assistants shunning the banned shops—or, in the strictly organized trades intolerable. Effort after effort has been made to beat the bakers, who hold very closely together, but with very little result. They will let down prices to a point, but no further, being quite aware that in all trades which take room there limits to competition. Two half-pence on two loaves are not equal to a penny on one loaf when the ovens will only hold so many loaves. Then the buyer who cares about the fall of a penny is always wanting credit, and does not like to quit the man who will give it, and who regards desertion as the unpardonable sin. Moreover, he, or rather she, believes in the customary price, and, whatever the newspapers may say, cannot get rid of the impression that somehow the underseller is giving her, in some way, inferior quality for her money—a belief diligently encouraged by the regular tradesman. And lastly, the underseller being anxious mainly for accidental custom, is neither so obliging, nor so patient, nor so careful about deliveries as his established rival. So strongly do these three causes work together, that we have heard of instances in which bakers in populous districts have bought their underselling rival's stocks, and sold them at their own prices without their customers either knowing or resenting the tax so directly levied. The force of habit, which even arrests downfalls in bread, is much stronger as to articles less needed and less accurately understood, till we arrive at cases in which, as in the milk trade, cheapness is positively suspected or disliked, as if it must of necessity be based upon some fraud. Of course, in the end, if wholesale prices are low, the undersellers win, and the new price establishes itself, in which case woe to the retailer when wholesale prices rise. They have to endure a storm of inquiries, objurgations and epithets which must take the sweetness of their previous gain quite out of them, and very often are compelled to yield and compensate themselves by unsuspected reductions in quality. As a rule, however, the demand that a customary and low price should be lower still comes with surprising slowness, and the distributors, when their wholesale market has given way, enjoy unexpected profits continously for months. The public will not, in this instance, grudge the shopkeepers their gains, for they had previously been suffering greatly from different causes—one being the difficulty of meeting the competition of the stores; but they certainly for some time past have had cause to bless the "general depression."—*Exchange.*

THE NEW WAY AND THE OLD.

How natural it is for a man who assumes a position to critisize the condition in which he finds things, and the work and arrangement of his predecessor. How many times in visiting manufacturing concerns have we had the faults, neglects and errors of "the fellow who was here before me," dilated upon by some new broom whose sharp corners and trim edges were already, we could see, beginning to wear off, and whose "head," as the politicians say, would doubtless some day "come off" with quite as many faults upon it to be dilated upon by his successor. Very few of us indeed could step down and out upon short notice and leave the affairs of our office in a state which could not be criticized with some degree of truth by our successor.

With these facts in mind an engineer who accepts a situation should find all the fault which there are about it, seek for all the points where improvement can be made, and then set quietly about having the requisite changes made. He will not gain any particular respect to himself, nor any special reputation for smartness, by parading his superior knowledge and ability, and will make the best impression even upon his employer by quietly calling his attention to the advantages to be derived from a change without finding fault with the condition in which you found it, or by respectfully insisting that an element of danger be removed without any uncomplimentary allusions to the man who preceded him. In suggesting improvements it is well to commence with small and inexpensive changes, which will pay a large percentage upon the amount expended in making them. If in such matters the employer finds the advice of his engineer to be good, his judgment sound, and that his cash balance is heavier for having followed them, he will be more ready to trust him with the handling of more important matters. He should, at the first opportunity, make a thorough inspection into the condition of his boilers in regard to their freedom from corrosion, scale and dirt, see that the passages to the water gauge are free, that the gauge cocks are clean, that the safety valve is large enough to clear the boiler of all the steam which it can possibly make, is in no danger of sticking from corrosion, and is not piped so that the water of condensation can stand upon its back. The safety valves for many boilers are figured from the grate surface alone, and this is frequently increased after the boiler has been in use, without a corresponding increase in the safety valve. Having determined the boiler to be in a safe and economical condition, or make it so if it is not, the engine should be looked over carefully for signs of wear, for errors in the setting of the valves, or for any chance of emprovement as regards economy or safety. The same attention should be paid to the piping and accessories, never having sufficent confidence in your predecessor to take it for granted that he leaves things all right, while exercising sufficent charity towards him not making his failings your chief topic of conversation.—*Boston Journal of Commerce.*

BOSTON BUSINESS.

The local railway are buying absolutely nothing, a somewhat unusual circumstance for this season. At this date they have always been about with their plans for the coming summer and fall, but the most diligent inquiry can elicit nothing yet in prospect for depot, bridge or car work. Per contra, the Baltimore & Ohio has just closed up its Boston negotations that foot its purchase of nearly four million, while the Pennsylvania and some of the western roads are gathering in about the same exaggregate, with one well known Boston road that runs west of Chicago wanting about 2,000,000 feet in one lot for new car works.

"Nothing doing" is the ready response in every lumber office to the inquiry "How's trade?' Yet at no time for several years has there been so many schedules floating about as now, and not often so many large ones. One new mill, to take over 2,000,000, is hanging around, while a host of small bills from 30,000 to 100,000 are looking for a hook to hang upon. The mills both south and north are bulls in the market, and decline to take orders except at full, and in some instances advanced, prices.

A couple of random cargoes of hemlock surprised the market the first of the week, the skipper snapped $13, his first bid, and then "blowed great guns" an hour afterwards because he was 50 cents behind high water mark. However this little Doans-street episode established a value, filled an anxious gap, and puts the market rather softly on $13 for random and $14 to $14.50 for such dule.

Builders heve idled away the week gossipping over the prospect. They find lumber, labor and hardware disposed to inflate, and some who have deserving surburban schemes in hand profess to believe that any advance over last summer's values will break up their plans. The new circuit of the Boston & Albany roads round and through the Newtons, that was to open last spring, and then in October, and now procrastinates until April, gave evidence of getting a $100,000 syndicate to build and boom this desirable locality, but the cost of the land and the lumber, they say, has already boomed them out of sight.—*Manufacturer's Gazette.*

SHILOH'S CATARRH REMEDY a positive cure for Catarrh, Diptheria and Canker Mouth. For sale by Ormond & Walsh, druggists, Peterborough.

PREVENTION OF FIRES.

There are some things quite interesting in a late circular issued by the Home Insurance Company of New York. A graphic diagram is given showing at a glance the proportion of causes to the whole number of fires that occurr in the United States for the year of 1884. From this diagram, it appears that most of the causes are incendiary, though a large portion of them are from defective flues, carelessness and other things that might be classed as preventable. Five-ninths of the fires are traceable to incendiarism, two-ninths to detective flues, one-twelvth to matches, the same to explosions of lamps and lanterns and general carelessness and one fifteenth each to lightning, spontaneous combustion and stoves and stove pipes. Many of these, it can be readily seen, could have been avoided by the exercise of ordinary prudence and foresight. Incendiarism is referred to as its "proportions could be materially reduced if each agent would be careful to ascertain the just value of property offered for insurance, and then firmly decline to insure or permit other insurance in excess of three-fourths of such value." No doubt many fires from this cause could be prevented by such a course of action but the eagerness on the part of agents receiving commissions on the amount of business done by them, greatly militates against carrying anything of this kind into practice to its full purpose. Fires caused by boilers and steam pipes are of infrequent occurrence, yet the location of the latter is of sufficient importance to speak of, in that they should not be allowed to come into contact with wood or anything liable to combustion, and should be so placed as not to serve as a convenient respectable for various odds and ends about the factory. The best plan to pursue is to suspend the pipes overhead at a proper distance from the ceiling, as they are then ont of the way, in as safe a position as possible, and capable of heating the space allottered to them as well as if placed in any other position.—*Boston Journal of Commerce.*

MALAYAN TIMBERS.

The advocates of the use of jarrah wood ought not to be too sanguine regarding the alleged pre-eminent qualities of that kind of timber, if any confidence is to be placed in the following extract from a recent issue of the Australian *Register*:—

"It would appear that the Western Australia jarrah wood is just as susceptible to the attacks of the cobra (teredos navalis) in water as it is to those of white ants on shore. The Whampoa, on her southern trip, took down a piece cut from one of the trial piles of the jetty, planted some months ago, which was thoroughly perforated by the sea worm. As the jetty piles are to be sheathed with copper, and the wood has otherwise proved to be very serviceable for piles, we do not suppose any alteration of timber will be ordered, as, as yet, the cobra has found it just as difficult to eat its way through metal in the water as the omnivorous white ants have on shore. True, it may be only a question of time and education, but until it is proved that iron and copper are no protection against the insects' encroachments it may be as well to chance it."

It is surprising that the enterprising contractors and engineers of numerous docks and jetties in Europe, as well as in countries less favored with valuable timbers, have never directed their attention to the serviceableness and proved capability of Ballow, Rassak, Billion, and Tumbusoo for such purposes. Those timbers have been entirely used in the construction of the Singapore and other East Indian piers and docks, and have given the utmost satisfaction. Ballow seems, however, to be the timber in greatest request, and large quantities of it have been exported from Singapore to India, China, Ceylon and Australia for this special purpose.

A PUGET Sound paper gives the scale of a single tree, cut at a Skagit river camp, as follows, the tree being cut into three 24-feet logs; Butt, 7,512 feet; second log, 5,732 feet, and top 5,826 feet—a total of 20,080 feet of lumber in the tree. The diameter at the small end of the logs was 78, 71, and 64 inches, respectively.

Chips.

THE ship Mercury, from Chatham, N. B., at Sydney, N. S. W., December 12, lost part of deck load of timber in a gale some days before.

THE schooner Lizzie K., St John, N. B., for Boston loaded with lath, was rapidly going to pieces February 5 on Folly island, off Cape Propoise.

SINCE August 1 last it is estimated that 1,500,000,000 feet of standing pine in Michigan has changed hands, the consideration for which approximates $5,000,000.

NOTICE of application is made in the Canadian *Gazette* by parties for incorporation as a railway bridge company, to build a bridge across the St. Lawrence at Brockville.

J. G. MCELWEE & Co., of Big Rapids, Mich. are shipping shavings from that point to Brunswick, N. J., the freight thereon being $80 per ton. It is not stated to what specific purpose the shavings are put.

AT Middle River, N. S., George Kerr & Son's "Burnside" Woollen Mills and steam sawmill, burned down in 1883, have been rebuilt four miles further down the river and fitted with cross-cut saws and shingle machines. It is in better condition than ever.

WORK at the Desoronto Cedar Mill is very brisk; shingles, posts, &c., are being turned out in great quantities. Car loads of cedar from the line of the Central Ontario railway arrive daily. Mr. G. W. Walker, formerly shipper on the east dock, is now attending to the packing and sorting room of the shingle department, while Mr. James Gorman takes charge of the first floor.—*Tribune.*

A DESPATCH from Bancroft, Hastings county, Ontario, says:— Lumbering operations are progressing favorably in this district, and a large amount of the produce of the forest, both in square timber and saw logs will be floated this spring. A quarter of a century ago it was supposed that ten years would exhaust all the merchantable timber in this part of the country, but those prophets were like the weather wise—they knew little about it.

MR. PETER MCLAREN, the well known Perth lumberman, says the Brockville *Recorder*, while in town on Saturday gave a striking instance of his liberality. He has large quantities of mill wood which makes excellent fire-wood, and is sold exclusively for that purpose. He offered to send three carloads to be distributed among the poor in the town provided the authorities paid the freight. It is needless to say the offer was accepted.

MR. ALEX. GIBSON, of Marysville, N. B., will make a special exhibit of the produce of his settlement, at the Conolian Exhibition in May, consisting of lumber, timber, cotton, cotton batting, bricks, etc. The educational exhibit from New Brunrwick will also be a large one. A trophy of wood is being prepared by the Government. It will occupy ten square feet and represent all the woods and shrubs of the province The shipbuilding interest will be represented by models of vessels and several applicable to the same. There will be a large fish and vegetable exhibit.

AUSTRALIAN HARDWOODS.

An Australian paper says:—"Probably no country in the world possesses finer or more durable hardwoods than New South Wales. Her iron bark and black-butts rank for durability second to none. Singularly enough all the principal hardwoods used in the colony belong to the great Myrtle family, which, according to Professor Baltour, contains 75 genera, and as many as 1,800 species. Some of the genera, such as the eucalypts, which constitutes at least three-fourths of the timber-producing trees, furnish the bulk of colonial hardwoods, iron-bark, black-butt, blue gum, stringy bark, swamp mahogny, tallow-wood, and yarrah all belong to the same remarkable genus, although differing in many ways, and in none more than their rate of growth, the blue-gums and black-butts being very rapid growers, while the iron-bark and box take much longer to mature. The emainder of hardwoods are principally angophoras or "apple trees," most of which are subject to gum veins; tee-trees, tristanies and syncarpias, better known as turpentine trees, but all members of the Myrtle family, and all growing in the open forest—very rarely in the bush or scrub."

U. S. TARIFF CHANGES.

WASHINGTON, Feb. 15. —Morsison's Tariff Bill will reduce the revenue about $20,000,000 a year. Of this amount probably one-half is taken off sugar, a little more than one-fourth taken off additions to the fee list, and a little less than one-fourth comes from various items scattered through the list. All wood and lumber not dressed is put on the free list with this provision, that the abolition of the duty is not to apply to any wood or lumber inported from a country that imposes an export duty on those articles. The other aditions to the free list are hemp, jute buts, sissal, and other fibre grasses, coal, salt, iron, led, copper and other ores, unmanufactured stone, chicory and other subsiltutes for coffee, corn, oats, hay, potatoes, extract of hemlock, and other barks, crude glyceryne, indigo extract, sulphate of barytes, unmanufactured crude borax, saltpetre, log-wood, and other dye woods, ochery earths, and unwrought clays. On the verious grades of sugar there is a general reduction of 20 per cent, but the reduction does not apply to any sugar on which there an export duty is levied, as is now the ase in Cuba. On the finest grades of cotton goods, the duties on which are *ad valorem*, no changes are made. The rates of duty are highest on the cheapest grades of goods, and on cotton yarns, and on the coarse cotton cloths some reductions are made. When existing duties are under 40 per cent *ad valorem*, they are not touched, but the duty on coarse cotton is reduced from 40 to 35 per cent. The duty on pig iron, is reduced from $6.72 to $5.60 per ton. The rate on steel and iron rails is reduced from about $17 to $12.50. There is a slight reduction in bar iron, and some varities of boiler and hoop iron, while others are not touched. The rate on structural iron and steels, is reduced from one and a quarter to one cent a pound. The three highest classes of crockery now pay duties of 60, 55, and 50 per cent; the new bill reduces them to 50, 45, and 40 per cent. These grades cover all ordinary crockery.

The World's Best.

It is certainly remarkable the wonderful cures effected by West's World's Wonder or Family Liniment This remedy has not an equal in the world for the speedy cure of Rheumatism, Sprains, Cuts, Bruises and all diseases requiring external application. Price 25 cents and 50 cents per bottle. Sold by J. D. Tully

AN EXTRAORDINARY OFFER.

To all Wanting Employment.

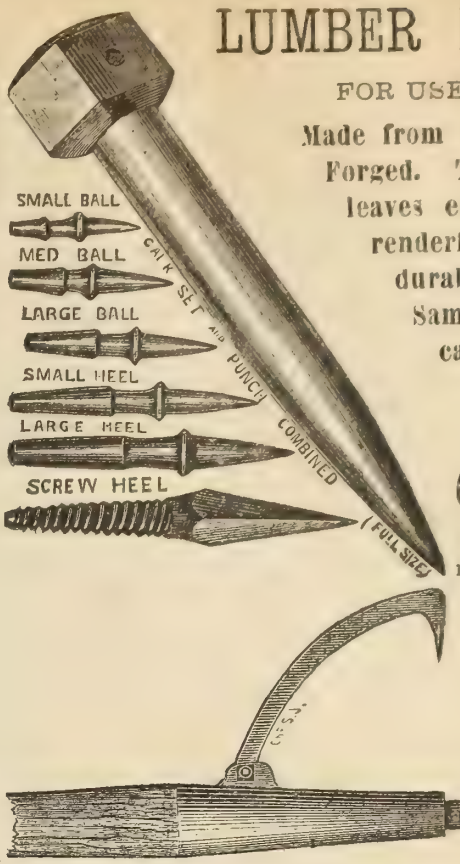
We want Live, Energetic Agents in every county in the United States and Canada, to sell a patent article of good merit, on its merits. An article having a large sale, paying over 100 per cent profit, having no competition, and on which the agent is protected in the exclusive sale by a deed given for each and every county he may secure from us. With all these advantages to our agents and the fact that it is an article that can be sold to every houseowner it might not be necessary to make an "extraordinary offer" to secure good agents at once, but we have concluded to make it to show, not only our confidence in the merits of our invention, but in its saleability by any agent that will handle it with energy. Our agents now at work are making from $150 to $600 a month clear and this fact makes it safe for us to make our offer to all who are out of employment. Any agent that will give our business a thirty days' trial and fail to clear at least $100 in this time, above all expenses, can return all goods unsold to us and we will refund the money paid for them. Any agent or general agent who would like ten or more counties and work them through sub-agents for ninety days and fail to clear at least $750 above all expenses, can return goods unsold and get their money back. No other employer of agents ever dared to make such offers, nor would we if we did not know that we have agents now making more than double the amount we guaranteed, and but two sales a day would give a profit of over $125 a month, and that one of our agents took eighteen orders in one day, Our large descriptive circulars explain our offer more fully, and these we wish to send to every one out of employment who will send us three one cent stamps for postage. Send at once and secure the agency in time for the boom, and go to work on the terms named in our extraordinary offer. We would like to have the address of all the agents, sewing machine solicitors and carpenters in the country, and ask any reader of this paper who reads this offer, to send us at once the name and address of all such they know. Address at once or you will lose the best chance ever offered to those out of employment to make money.

RENNER MANUFACTURING CO.,
116 Smithfield St., Pittsburg, Pa

LUMBER DRIVERS' CALKS

FOR USE IN STREAM DRIVING.

Made from the Best Refined Tool Steel and Forged. The method used in tempering leaves every one of the same temper rendering them stronger and more durable than any other Calks made Samples and prices free on application to the undersigned.



THE

Orono Cant Dog

Strongest and Lightest in the market. Made of Best Cast Steel by drop forging process. The Handles are made of best quality straight grained split and turned Rock Maple, 5 to 6 feet in length, bored specially to suit the pick. Prices on application.

Market Reports.

TORONTO.

From Our Own Correspondent.

FEB. 22.—The retail and wholesale trade continues fair, considering the wintry weather we are now having. Prices remain firm. Offers are now making for next cut of logs, but millmen are high in their demands, evidently expecting a boom in lumber on the opening of the cutting season. In this I think they will be mistaken, it is now qulte evident that a full stock of logs will be got in, and the only hope for any boom is in the scarcity of lumber left over from last season's cut, and the only chance for materially improved prices will be on such stocks, or portions of stocks, that may be now on hand, in condition fit for immediate use. There is but little prospect of the duties on American shipments going off this season, so that with a full stock of new logs, and no extraordinary demand over past years, it is hard to see how prices can advance much beyond that now obtainable, and past experience justifies the opinion I have expressed in former letters,—that manufacturers who dispose of their stocks early in the season generally come out first best.

Considerable annoyance and loss to holders of stocks on the line of the N. & N. W. R. R. has resulted through the failue of the above road to meet the cut rates made by the G. T. R. R. Co. to points in western Ontario from off their Midland division. For some time past shippers over the latter road have shipped lumber and shingles to London and other points on a 10-cent rate, while the N. & N. W. R. R. Co. have demanded a 15-cent rate. This made it quite impossible for dealers to ship and compete with holders of stocks on the Midland line. Under the management of the late Mr. Cumberland such a state of things would not have been allowed to continue for a single day. The cut would have been met at once promptly. The result will be that stocks on the Midland in future will be at a premium, as this winter is not the first time that the same state of things has existed, and it certainly seems unaccountable why the present management of the N. & N. W. R. R. so blind as to both their own and their patrons interests, some reason, I presume, there must be, unknown to your correspondent. In the meantime holders of stocks on that line must wait patiently for a resumption of equa rates by both companies before they are able to ship.

MONTREAL.

From Our Own Correspondent.

FEB. 23.—As usual at this season of the year the market is very quiet, but the prospects are encouraging, and there is a bright outlook in the building line. Enquiries are already being made by some contractors for large bills, and the retail trade also promises fairly.

Prices of all grades are very firm, with a prospect of higher figures. Basswood is weaker than last year, as there is a good deal offering. Cull deals are scarce and prices high. Prices in Ottawa are steady, but our next report will probably show an advance all around, as there is very little stock unsold, and holders are looking for higher figures.

The demand during the past year appears to have been very good, as compared with the year before, as the receipts for the local trade were nearly 89,000,000, against 76,000,000 in 1884. The following were the actual receipts by the various channels:—

Per Grand Trunk Railway	19,557,000 feet
" Canada Pacific "	10,540,000 "
" Lachine Canal	48,799,000 "
" River St. Lawrence	9,871,526 "

Prices are as follows:—

Pine, 1st quality, ₱ M	$35 00@40 00
Pine 2nd " "	25 00@30 00
Pine, shipping culls, ₱ M	14 00@16 00

CORDWOOD.

The cordwood market is very dull, prices are high, but fair:—

Long Maple, per cord	$ 6 00@6 50
Long Birch "	6 00@0 00
Long Beech "	5 00@5 50
Tamarack "	5 00 0 00

CHICAGO.

AT THE YARDS.

The *Northwestern Lumberman* of Feb. 20th says:—Interest now centres in the attitude of trade in regard to prices. Thus far the dealers have acted commendably. They have fairly adhered to the policy of firmness declared at the year's beginning. Isolated instances of cheap selling have been known, it is true, but as a general thing the disposition has been to stand firm for what was considered to be fair prices on a basis of $11 a thousand for piece stuff, $14 for No. fencing, $11.50 to $12 for No. 2 boards, $13 to $14 for common boards—unless 20 feet long when more is realized. There is trading between yards at lower prices, of course, but bills sold out of the yard to the regular distributive trade hug these quotations closely, when the stock is dry.

There is considerable inquiry for good lumber for factory work. As yet this call has not become very pronounced, but it is looking up in a manner that indicates a good future demand The extent of the near-by demand for better grades of lumber this year will depend on the extent of building. While there is still an expression of confidence in a good coming season for building operations, prospects have not yet sufficiently developed to render such a conclusion positively certain. The possibility of labor disturbance still looms like a cloud in the near future. Late strikes and lock-outs in this city indicate the temper of both employes and employers. Eight hours a day will undoubtedly be demanded on May 1st, with what result cannot be definitely forseen. It is possible that building will, in a measure, be checked by the looked-for trouble. Yet the necessary growth of the city and its suburbs will ensure a fair amount of construction during the year. Outside it is not likely that labor disturbance will greatly effect trade, though it may in the larger cities, like Kansas City, Omaha, and others in West.

The brightest outlook for the lumber trade this year is in the direction of railroads. The call for car stuff is active, and prices for strips suitable for this purpose are a dollar or more higher than for other lumber of corresponding grade. Some dealers, especially those handling largely for the trans-Missouri trade, begin to observe an increased demand from the railroads on other account than that of car building. The railroads are the lever that is to lift the trade wagon out of the slough in which it has been dragging for two years past. Nothing else is in sight equal to the emergency. The farmers cannot do it, for their ability to buy lumber and improve is curtailed by the low value of what they have to sell. After the railroad boom has acquired full headway, and given employment to the surplus labor of the country, we may expect higher prices for farm products, and a consequent increased rural demand for lumber. This cannot come for several months. Farmers will not realize the benefit of railroad construction before next fall. But the large amount of railway work in the western states during the season will promote the building up of numerous little towns, the establishment of new yards, and the use of a large amount of lumber and coarse forest products by the contractors. This demand may tide the trade over until the farmers can catch hold.

It is evident that the yard dealers feel more than usually cheerful and confident in view of the prospects. They evince a disposition to wait the natural and healthy movement of lumber, and do not manifest that feverish haste to crowd off stocks that has been witnessed in former seasons. No surer test of confidence in future values than this could be asked for.

According to the report of stock on hand February 1st, as made to the secretary of the exchange, a decrease of 4,674,482 feet was shown in the total, as compared to amount on hand at a corresponding date the year previous. Stocks decreased during January to the amount of 41,924,891 feet in spite of adverse weather conditions. It is predicted that on March 1st stocks will show that there has been a healthy decrease during Februrary. On the whole, trade this winter has been somewhat in excess of that during the winter of 1885.

Receipts of lumber and shingles for the week ending February 18th, as reported by the Lumberman's Exchange:—

	RECEIPTS. Lumber.	Shingles.
1886	5,235,000	1,300,000
1885	960,000	182,000

OSWEGO, N.Y.

From Our Own Correspondent

The demand since our last has been very good, though we cannot advance our quotations. Country dealers are only purchasing to keep up assortments, most of them have run on very short stocks during the winter. Collections are fair. The Ottawa boom in prices will scarcely reach here, considering the increase in the quantity of logs being taken out.

TYNE.

The *Timber Trades Journal* says:—The frost and snow which have held everything in their grasp for several weeks past have at last disappeared, and outdoor employments are now to some extent being resumed. For many weeks past building operations have been almost entirely suspended, and it need scearcely be pointed out, this has been a most disastrous effect upon all those engaged in the timber trade.

None of the saw mills have run more than three quarter time, and a considerable part of them not even that. Now that the weather is a little more favorable, operations will be resumed, but the look-out is not at all inviting.

So far the shipbuilding dispute is unsettled, and appearently no nearer to a solution. The iron and coal trades are also very quiet, while the building trade is appearently, if one may judge from the sign of empty houses here and there, a little overdone.

Stocks of wood goods still continue high, and in all likelihood the importation for this year, if confined to the requirements of the trade, will be but small. A few ships are being asked for, but in amount they are not large.

The importations for the past seven days have been mainly per steamers, and are not of much importance either in number or amount

GLASGOW.

The *Timber Trades Journal* of Feb. 13th says:—Our wood import list for the past week is almost a blank. There have been no arrivals at Greenock or Grangemouth, and only a few staves, &c., (about 30 loads) at Glascow; but though not entered in this week's list, there has just come to hand a cargo of spruce deals from Dorchester, N. B., the first of this year's import of spruce deals at Glasgow, and consigned to Messrs. Edmunson & Mitchels.

The change we are beginning to experience from the late severe weather will have a favorable effect on the timber trade, as the protracted wintry weather had stopped outdoor building operations, and was a hindrance to the inspection of timber in ponds.

An auction sale of timber and deals, result of which is given below, took place at Greenock on the 4th inst., when transactions were to a fair extent, over 400 logs changed hands besides deals. Birch timber of small squares (stock of which is heavy) is not in demand, and prices obtainable are low.

A public sale of mahogany and cedar, as will be seen from our advertisement columns, is announced by Messrs. Willian Connal & Co. to take place at Queen's Dock, Glasgow, on 23rd inst.

AUCTION SALE.

On 4th inst., at Greenock, Messrs. Singleton, Dunn & Co. bankers:—

Quebec waney boardwood—		Per c. ft.
40 c ft. av. per log		1s. 9d. & 1s. 8d.
Quebec yellow pine—		
35 & 40 c. ft. av. per log		1s. & 1f. 0½d.
Quebec red pine (100 logs)—		
45 c. ft. av. per log		1s. 3½d.
25 & 30 "		10d. and 10½d.

9 " 20 "	8×3	8½d.
9 " 20 "	7×3	8½d.

LIVERPOOL.

The *Timber Trades Journvl* of Feb. 13 says :—At the time of writing there have been no public sales held this week; hence the business done has been quiet and uneventful. Some life may yet be infussed into the trade, as two sales are announced, one of pitch pine,&c., by Messrs Price and Pierce, and Messrs Edward Chaloner & Co's sale of mahogany and fancy wood.

There is no great disposition shown to enter into contracts for future supplies, and it is reported that the efforts of the Swedish and Quebec goods have not met with any great measure of success.

So long as trade of this district continues to be in the unsatisfactory condition it now is, so long will there be a desire to act with commendable caution and resistance. Unfortunately there seems little prospect for any marked improvement at any rate for the immediate future, in the face of wage disputes now pending between the manufacturers and operatives in Oldham and other cotton spinning centres, and which have considerably effect the disturbing of other branches of business, so long as they exist.

The freight market here is very quiet, as may be supposed from what is said above, and we do not believe that any vessel has yet been positively fixed for Quebec and this port. The rates offered are about 20s. per load for timber, and 50s. per standard for deals.

Matters did not improve at the sale of pitch pine held by Messrs. Price & Pierce, the result showing a further decline in prices, which in a measure may be attributable to the extensive sale of this wood announced to be held next week by Messrs. James Smith & Co.

No fault could be found with quality and condition of cargo per Woodfield, and the result may be taken as a fair measure of the value of this wood as Mr. T. B. Neale, the auctioneer let no opportunity pass of bringing out the best in bringing out the best possible result. The plank per Megisiature are mostly of very short lengths and narrow widths; still they were very cheap at the prices obtained.

The following prices were realized :—

FRESH PITCH PINE TIMBER,
Ex Woodfield, from Mobile.

Feet Long.	*Inches Wide.*	*Per c. ft.* s d.
20 to 35	17×19 to 20×22	1 6½

LONDON.

The *Timber Trades Jounal* of Feb. 13 says :—Messrs Churchill & Sim had a moderate attendance at their sale on Wednesday last; the room was tolerably full, but those who occupied the their seats with a fixed determination to bid were hardly so numerous as on the previous occasion. The day being fine the avenue leading to the room was thronged by verious members of the trade, but the riots at ths West End rather than the disposition of prices seemed to be the topic most frequently discussed.

The effect of the continued frost on the dock deliveries is again apparent; and this, together with the stagnation in building, rioters—though prehaps, good for the glaziers—has certainly imparted a less hopeful tone to the market.

Building was very dull, and Mr. Churchill had some difficulty in getting buyers to advance on their opening offers, many lots getting no further than that limitation; one fact, the broker seemed to consider it useless to linger over the lots in a general way, and it did not take very long to see whether there was a chance for getting a bidder to go on when once a pause enued.

Prices on Wednesday may be set down a very poor, and illustrative of the sensitiveness of the market to the depression, which recent events have rather agitated than otherwise.

Stowage goods, of which many of the deals now and again offered by auction consist, though bearing all the characteristics of the leading shipments and qualities, at least as far as description goes, and nevertheless not equal to the rest of the cargo, and when we see first-rate stock selling under price it will be safest to set it down to some such cause. There can be no question that 3+11 in. in prime quality are very scearse at present, and though undoubtedly feeling the effect of of the depression, yet nothing like to the same extent as more general sizes. One reason why speculation is so dead is that there is nothing to look forward to; it would not matter so much at the present if there was anything like a probability of things mending, but nobody can point to the direction that the improvement is to come from.

The disturbance here, though further checking trade now, may prehaps be the foundation of a better state of things by awakening the authorities to the necessity there is for taking some steps to stimulate the industries of the country, which have for a long time been on the decline. It is only in this direction—unless we can find a solution to the question in the promotion of emigration—that the wished for recovery in commerce can be arrived at.

The timber sold on Wednesday seemed to partake of the same inativity, and bidding was slow, yellow pine ev Terpsichore, from Quebec. This hung fire at 45s., and it was some time before the brokers got a bid at all. After lingering awhile, the hammer had to fall without any body caring to advance on the opening figures There were only about three buyers in the room that cared to offer for it, and in a kind of a see-saw fashion, first up and than down, the parcel was disposed of, the best price being, 57s. 6d., which one lot of wany realized. The time certainly does not seem proitious for shippers on the other side to be demanding higher values free on board. If they can succeed to place their f.o.w. stock at last year's quotations they will have done well Of course we are only alluding now to London Market, but we assume the provincial ports to be pretty much the same position, viz., full stock and a slack demand.

The week dock deliveries again compare favorable with last year, though not much materially on deals and battens (51 standard). On flooring the difference is highly significant of the times, no less than 158 out of an average weekly consumption of 4,000 standards representing the shortage on this one item. The comparison with the corresponding week's con consumption last year of floating timber leaves our present record short 249 loads. We hope the weather will prove to be partly the cause of this decline; but we must not attribute it all to that account, for with a week or two's return to mild weather we did not find the improvement we expected.

On Thursday Messrs. Churchill & Sim had a pretty good muster of buyers in and out throughout the wholesale. The plan seemed to be to drop in when something the intending bidder was going in for was likely to be coming under offer, hardly any body seemed to care to it the whole programme through. There were, we noticed, plenty in the room to lift prices if the demand from outside had afforded them any excuse. But when bidding became brisk, which it did at times, it was prompted almost solely by the low price that the goods were falling at. This was very noticeable when the finish parcel, ex Dewdrop, was submitted, the boards especially going remarkably low.

THE LUMBER OF 1900.

The lumbermen of the present hour is a sharp buisness man—quick to note advantages in the market alike of labor, produce, or lumber, and enterprising in opening new channels of production or sale. He can "size up" a timber berth, lumber pile, or gang of men with almost unerring judgment. He deals with the seen and tangible, and sharp perception, quick decision are qualities daily requisite. He is apt from his vocation to be rather positive of his knowledge and autocratic in his managenent of business. He is a great improvement to the happy-go-lucky jobber of half a century ago, who hunted up a grove of pine in some accessable position, found a supplier to carry on the necessary expenditure, hired a gang, and came out in the spring a little ahead or a good deal behind, as the weather and market might determine.

The lumbermen of the year 1900 will be still another style of man, and a great revolution in methods of operation will be the result. "The white pine like the Indian is doomed to extinction; neither can bear cultivation" is the dictum of a philosophic lumberman. Assuming that the present mode of lumbering is pursued twenty years longer, little pine will remain in either Michigan or Ontario, and we must look to some means of supplying our daily needs for houses, cases, etc. That this may be by pressed pulp and peat there can be but little doubt; and we trust that the change will even be to our benefit. The range of timber suited to pulping is annually extending, and the applications to the finished product to domestic use rapidly increasing. That ultimately all kind of of timber will be pulped and pressed into required forms, without any loss of material, may be regarded as certain. Instead of saws, boring, mortising machines, planers, moulders, glue pots, etc., we will see extensive ranges of hydriolic presses, steel moulds, and trimmings for the pressed goods they procure. The man that directs all will be a trained chemist, who can call all the appliances of modern science and technical skill to his aid—who can unroll the mazes of natural handiwork in vegetable life, and grasp the fibre at the stage suited to his purpose. Asbestos, talc, mica, graphite, kaolin and other mineral bodies will play a part in his operations; oxides and chlorides of the metals will be used to indurate the pulp board and render it incombustible—its hues may vie with rainbow tints, and its durability outlasts the Egyptian granite. Such we believe to be the coming lumberman and his material. There will be then little running of rapids, booming and all the romatic routine of the raftman's life. Whole sections will be devoted to the cultivation of pulp timber and fibrous grasses; and thus the gallant, adventurous raftsman will subside into the scientific farmer, and reap his laurels (and his profits) from the flowery field instead of the foaming flood.—*Toronto World.*

PROPOSED CHANGE IN THE U. S. TARIFF.

The following is a somewhat clearer statement of the charges proposed by Mr. Morrison, after July 1st, 1886, as far as they affect Canadian interest :—

FREE LIST—ADDITIONS.

Lumber, hewn and sawed, and timber used for spars and in building wharves; timber, square and sided, not specially provided for; sawed boards, plank, deals and other lumber of hemlock, whitewood, sycamore and baswood, and all other articles of sawed lumber; hubs for wheels, posts, last-blocks, waggon blocks, oar-blocks, gun-blocks, head-blocks, and all like blocks or sticks, rough hewn or sawed only; staves, or wood of all kinds, pickets and palings laths, shingles, pine clapboards, spruce clapboards, wood, manufactured, not specially enumerated or provided for (proviso—inoperative when imported from a country laying an export tax); salt in bags, sacks, barrels or any other packages; salt in bulk; hemp, Manila, and other like substitutes for hemp not specially enumerated or provided for; jute butts; jute—sunn; Sisal grass and other vegetable substance not specially provided for; iron ore, including manganiferous iron ore; also the dross residuum from burnt pyrites; sulpher ore, as pyrates or sulphuret of iron in its natural state, copper imported in the form of ores; lead ores and lead dross; chromate of ore, or chromic ore; mineral substances in a crude state and metal unrought, not specially numerated or provided for; coal, slack or culm; coal, bituminous and shale; Indian corn, or maize; oats, hay, potatoes; chickoery-root, ground or unground, burnt, prepaired; acorns and dandoline root, raw or prepared, and all other articles used or intended to be used as coffee, or as substitutes therefor, not specially numerated or provided for; bristles, grease; tallow; grindstones, unfinished; stones unmanufactured or undressed freestone, granite, sandstone and all building or monumental stone except marble, not specially enumerated or provided for; beeswax; glycerine, crude, brown or yellow, for the specific of one and twenty-five hundredths or less at a temperature of sixty degrees Fahrenheit, as purified by refining or distilling; extract of hemlock and other bark used for tanning, not otherwise enumerated or provided for; indigo, extracts of, and carmined; Lee's brysteles; baryta, sulphate of or barytes, unmanufactured borate of lime; crude borax, potash; mitrate of or salt petere, orude; logwood and other dyewood and extracts and decoctions of; coal tar, crude; ochre and ochry earths, umber and umber earths and sienna and sienna earths, when dry; all earths or clay, unwrought or unmanufactured, not specially enumerated or provided for.

The bill provides that from and after July 1, 1886, the following rates of duty shall take effect :—

WOOD.

Sawed boards plank, deals and other lumber of hemlock, whitewood sycamore and basswood and other articles of sawed lumber, when planed or finished, for each side so planed or finished, 50 cents per 1,000 feet, board measure.

LEAD, ZINC, ETC.

Lead, in pigs and bars, molten and old refuse run into blocks and bars, and old scrap lead, fit only to be remanufactured, 1½ cents per pound. Lead, in sheets, pipe or shot, 2½ cents per pound.

Zinc, spelter, or tutenegue, in blocks or pigs, and old worn out zinc, fit only to be remanufactured. 1 cent per pound; zinc, spelter, or tutenegue, in sheets, 2 cents per pound.

SUNDRIES.

Marble of all kinds, in blocks, rough or square, 50 centss per cubic foot; veined marble, sawed, dressed or otherwise, including marble slabs and marble paving tiles, $1 per cubic foot.

Stones, free stone. granite sand stone and all building or monumental stone, except marble, when hewn, dressed, or polished, 20 per centum ad valorem.

BOARD OF TRADE RETURNS.

The following are the returns issued by the Board of Trade, for the month of Dec. 1885 :

MONTH ENDED 31ST JAN., 1886.

THE band saw boom is rising, Messrs. Churchill, of Alpena, will have one planed in their mill this season.

BAND SAWS—JIG SAWS—SHAVING VAULTS.

The band saw mill has not yet been brought to perfection, and probably will not yet for years to come. If it were perfect we would have no further use for jig saw, and the jig saw is generally a rattling, jumping nuisance. The saw is always getting out of square ; the crank shaft is out of balance and jumping around about as it has a mind to, while if the saw is a gate saw the gate gets loose and racketty, the sawer gets demorlized and your jig-saw work falls into disrepute in the market.

The band saw is not a perfect tool, because we cannot do inside work with it. No practical method has yet been found for joining a saw so that it may be connected and disconnected at will, to enable it to be used for inside work. There is a device whereby a band saw may be unhooked and hooked together again, but it is not of much value. It breaks easily and often, and it costs considerable to repair it. Good jig saws are very scearce. They are not found in every shop, and even every other shop does not have a first class jig-saw.

A saw which has the over-head portion bolted to the floor-joise above, independent of the table —that saw is a tool that you want to sell before you are a day older. Prehaps the maker of that saw came to the shop and set it up himself. It did work nice, there was no mistake about that. It cut square, fast, and smooth, and what more can a saw do? The next morning Bob nailed up four inches thick of gingerbread work and began to saw it. The narrow parts of the scrolls were about one-eighth inch wide. The saw cut quick and smooth and Bob cut around the piece. While he was sawing Tom loaded a truck and took it upstairs on the elevator. When Bob got the pieces sawed he naturally turned them over and looked at them. The narrow part of the scroll was cut completely off. That two thousand pounds of stock on the truck had sprung the floor enough to throw Bob's jig saw one-sixteenth inch out of line. As long as that saw stayed in the shop you could count on its being ready for "inlaid work" and it never could be depended on to cut two bevels alike. The best jig saw we have yet seen is in the shop of Mr. J. W. Cooper 17th street and Washington avenue, Philapelphia. He has eight or ten of these saws. They were built expressly for his own use, and the designs were also his own. They are built on a frame similar to that of some band saws.

The frame was shaped like the letter C. The crank shaft was in the lower part of the back of the frame, and actuated a double segment rocker arm, which gave motion to two straps, one of which went to the upper end of the saw the other to the lower end. The direction of the straps was changed to perpendicular by two light pulleys, the lower one fixed to the upper pully hung in a frame. This frame rested upon a wedge. To take out the saw the wedge was withdrawn. To strane the saw the upper pulley and its carriage were raised with one hand while with the other the wedge was pushed into position. These saws worked well. They did not shake enough to displace a five-cent piece when set on edge, upon the saw cutting two inches of black walnut.

"How is your shaving vault rigged?" we asked Mr. Cooper after we had inspected his jig saws. "Well, I'll show you," said he. "There it is, you will see that it is simple, a big brick well. There is nothing about its construction that can be burned. The walls are brick. It is 25 feet up to the iron roof, and if the shavings get on fire the whole thing acts like a big fire place The shavings burn up and that's all there is about it." "Ever have a fire there?" "Oh yes. The shavings will get on fire once in a while, but it never cost the insurance folks anything yet."

Why is this not a good idea?—*Cabinetmaker.*

Bright Outlook

NEW YORK, Feb. 15 —It is stated that the outlook for the lumber trade this spring is decidedly bright. The stock of all kinds of lumber and timber on the market is smaller than it has been for some years, and in view of the good demand and brisk building outlook, there is every prospect of a bright season ahead.

EXPORT DUTY ON LUMBER.

The question of placing an increased duty on logs exported from Canada has attracted considerable attention of late and some with a view to further protect the lumbering industries of the Dominion are urging that the duty be increased. A *Free Press* reporter waited on Mr. Johnston, commissioner of customs, to-day with regard to the matter.

"I wish to ascertain if there is any duty on logs exported from Canada?" asked the reporter.

"Yes," answered Mr. Johnston, "There is an export duty of $1 per M on spruce and pine logs."

"I suppose you are aware that American firms are proposing to ship logs this season from Georgian Bay section to the Michigan mills?"

"I am not aware of that."

"How does the export duty work?" queried the reporter.

"Well I cannot say that it works satisfactorily ; it is so surrounded with difficulties to enforce the regulations. Our frontier line is so long, and the territory to be covered so extensive, that it cannot be otherwise. I see that a measure for taking off the duty on Canadian importations will come up before Congress, and I trust that it will pass, as it would be the means of equalizing things."

"The duty of collecting this export duty is found to be difficult is it?"

"Most difficult. Take for instance New Brunswick. There is only an immaginary line there and Americans come in and draw logs away and what can we do. To enforce the duty it would be necessary to place a man at every lumber camp, and this would be altogether too expensive. In fact the cost of so doing would far exceed the revenue dereved."

"What about Ontario?"

"Well take the lakes for instance. The line of demarcation is supposed to be in the centre of the lakes, you cannot make any seizures for duty while the lumber is in Canadian waters and it would be necessary to have a man on the line to enforce the regulation, which is utterly impossible. The outlets are so numerous for this kind of thing that no body can fancy the difficulty with which it is encompassed."

"What do you think would meet the case."

"I am as strong for protection to our native industries as anybody, but I think the only way the case can be made satisfactory is receiprocity in lumber. If the Americans would take off their duty on sawn lumber everything would be all right. An export duty is a two edged sword."—*Ottawa Free Press.*

Scott's Emulsion of Pure Cod Liver Oil with Hypophosphites,

For Anaemia and Marasmus in Children.

Dr. W. G. Gentry, Kansas City, Mo., says: "I have used Scott's Emulsion for years, and for consumption and anaemic patients and children with marasmus, have found it very reliable. Have frequently given it when patients could retain nothing else on the stomach."

A Bad Case.

A Lady writes: "I had almost given up all hope of having my natural growth Hair back, as I tried most everthing advertised for the hair. I can now thank Dr. Dorewend's Hair Magic for not alone restoring the growth, but also the color. I have used two bottles and my hair is in a state of perfect satisfaction to myself." for placing your goods or wares before the saw-mill men and lumber and timber dealers of the Dominion.

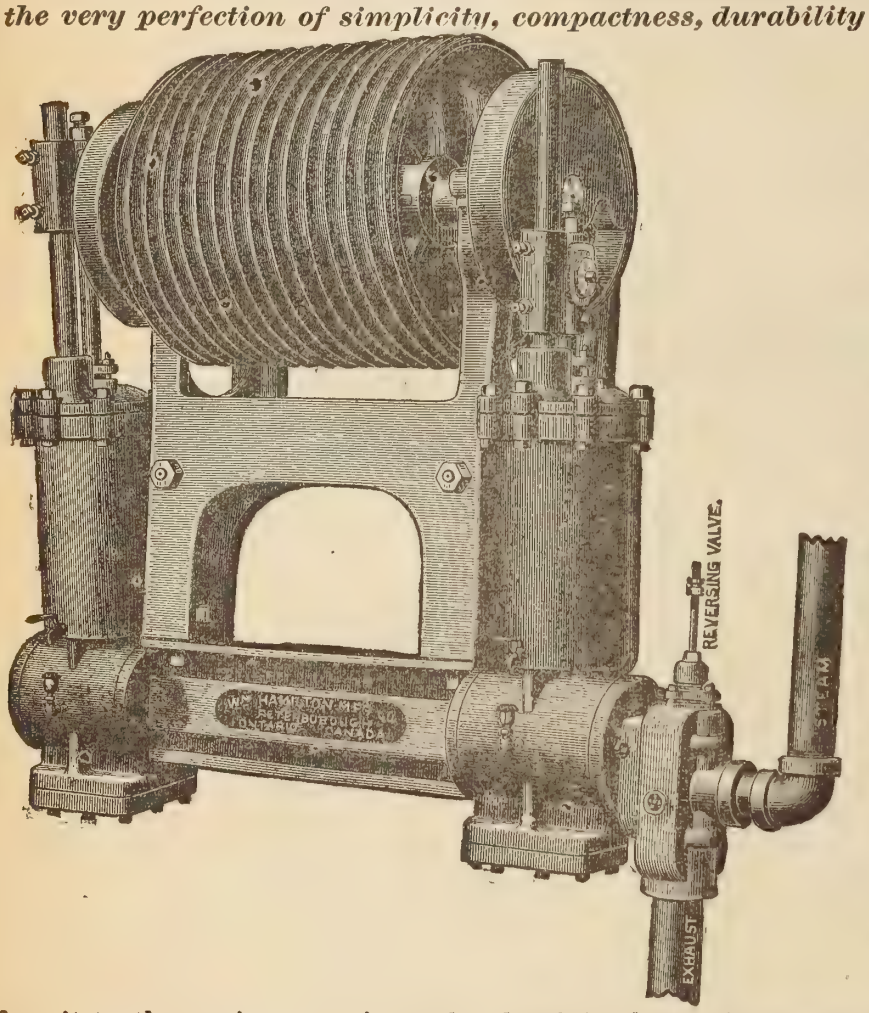
CUNNINGHAM'S
PATENT OSCILLATING TWIN ENGINE

FOR STEAM FED IN CIRCULAR MILLS WITH RACK OR ROPE.

This Engine has practically but two moving parts, aside from cranks and shafts. The whole array of eccentrics, valves, valve rods, connecting rods, cross heads, slides, levers, rock shafts, bell cranks, etc., is done away with, and the very perfection of simplicity, compactness, durability and cheapness attained.



The above engraving illustrates the Twin Engine, 10x16, for Rope Feed, for Saw Mill Carriages. The spool is 27 in. diameter, 30 in. face, is grooved 2 in. pitch for 1½ in. rope. The shaft is steel, 4½ in. diameter, with disk cranks. No connecting rods, eccentrics or valve rods to get loose and out of order. The ports are in the trunions, and worked by an oscilliation of the cylinders, and are held in their place in the downward motion by a steam cushion below. The sawyer's valve is a perfect balance, and by moving this valve the engine can be reversed, stopped or started almost instantaneously if necessary, as the sawyer has perfect control of it by his lever either to go fast or slow. Should the sawyer let go of his lever either by mistake or any other cause, it is balanced so that the valve will come to the centre and cut the steam off both cylinders and stop the feed. When standing, the lever is locked or fastended, so that is is impossible for it to start off itself. The engine stands upright below the carriage, and bolted to two upright beams, placed on the mill for the purpose. When a rack is preferred in place of the rope, we put on a steel wheel 30 in. in diameter, and the engine placed high enough to work into the rack on carriage bar, or if the beams come in the way, an idler wheel can be used between engine and rack segs; or, the engine can be placed at a distance and have a shaft from it to the carriage; or it can be placed in the engine room, where it is under the control of the engineer for oiling, thence by shaft and pinion to carriage rack bars. These engines are well adapted for cutting long logs, or where the logs are mixed, the advantage of this feed will be apparent to mill men. When the carriages are used in two or more sections, the couplin and ncoup ling of each section is quick and simple.

There were two of these feeds working this summer and giving the best of satisfaction, one with rope feed at James Playfair & Co's Mill, Sturgeon Bay, near Waubaushene, and one at the new mill furnished by us to Francis Carswell & Co., at Calabogie Lake, on the Kingston and Pembroke R. R. This mill is working with the Rack and Pinion feed, and drops from fifteen to seventeen stock boards per minute. We have also sent one to the Rathbun Company, Deseronto, to put in to feed their heavy Circular Mills. They will also commend themselves for various other cases, especially for running Elevators, hoisting Engines, and wherever a simple and easily reversible motion is required.

We would also call attention to our Improved Hand Saw-Mill for cutting logs

☞*We guarantee this to be the best Mill of its kind got up, and would ask any one wanting a good Band Saw-Mill to communicate with us. We would also call the attention of Mill Men to our new IRON GANGS, CIRCULAR MILLS and MILL MACHINERY. For further information, prices, &c., address the Manufacturers,*

VOL. 6. PETERBOROUGH, ONT., MARCH 15, 1886. NO. 6.

A TERRIBLE WARNING.

In its issue of Feb. 22nd the Ottawa *Free Press* tries to frighten those who advocate an increase of the export duty on logs by publishing the following:—

"The people who want to protect the lumber industry of Canada, by increasing, and rigidly enforcing the export duty on logs, have a warning in an incident which comes from St Lucia, in the West Indies. A correspondent says there 'is a mountain near the southwestern end of the island called Suoffriers, the remains of an old volcano whose crater is full of sulphur. Some years ago two gentlemen from Antigua bought this mountain and set up works for extracting the sulphur. The first year they sent away nearly 600 tons of purified sulphur. But the natives thought they were doing entirely too well for a couple of mere foreigners, so they put an export duty of $4 a ton on sulphur and so put an end to the business, and from that time the sulphur mine has lain idle.' A heavy export duty on logs would probably have the same lamentable effect in this country as happened in the illustration given of another export duty."

This warning does not warn. It would not be considered a calamity by many in this country if the business of exporting logs did cease entirely. It will be noticed that the foreigners who exported the sulphur from St. Lucia purified it before exporting it—they manufactured it. But the United States dealers who export logs do not manufacture them and they, through the operation of the United States import duty on lumber, are given an advantage over Canadian dealers. An export duty on sawn lumber would be analagous to the action of the natives of St. Lucia, and it would be suicidal, but an export duty on logs is different and would be beneficial to the lumber business and to the country.

LUMBER TRADE IN NEW YORK.

A reporter of the New York *Herald* has been among the dealers of the metropolis and reports the outlook for the lumber trade this spring as decidedly bright. Although the business has been generally dull throughout the winter, there have been many firms who have done a good trade, and an improvement in the business of all is now becoming noticeable. As long as the weather remains cold and inclement the masons and carpenters cannot do their work and building has to be abandoned, and for this reason a depression in business during the winter months is expected by all lumbermen. At present the stock of all kinds of lumber and timber in the markets is smaller than it has been for some years, and in view of the good demand and brisk building outlook there is every prospect of an active season ahead.

To be impressed with a sense of the extent of New York's lumber trade one has only to walk down Eleventh avenue, from Forty-second street to Fourteenth street. He will find lumber yards all along, on both sides of the way, and lofty piles of lumber meet the eye in every direction These woods are of all kinds and come from all parts of the country. From the common Maine spruce, which is properly timber and not lumber, to the finest mahogany and rosewood, all kinds of lumber are to be had at all kinds of prices.

WHAT MR. ATCHISON SAYS.

At the foot of West Twenty-first street is the establishment of the New York Lumber Auction Company (limited), and here a *Herald* reporter stopped the other afternoon to inquire about the present state of the trade. Mr. Atchison, the general manager of the company, was in his office adjoining the yard.

"The spring trade is just opening," he said, "and the prospects are very good. New York is a good lumber market, but it is not an attractive one, and this is due to its system, or rather lack of system, concerning the rules of inspection. There are no determined rules. Each dealer has his own, and the lumber, when it arrives from the south and west, may be inspected leniently and fairly, or the inspection may be rigid and 'cut-throat,' according as the dealer chooses. This renders the shipper very suspicious about sending his lumber here. It may be appraised at half the value it would elsewhere receive, and dealers often do not sell by the same rulers upon which they buy. To avoid all this we have published a list of set rules of inspection, by which we both sell and buy, and this gives the shippers and manufacturers a confidence in our market. The best lumber is brought to New York and the highest prices obtained here, but the consumers suffer.

"There is another peculiarity about the New York trade," continued Mr. Atchison, "and that is the number of lumber firms which deal only in special woods. By purchasing large quantities of one kind of wood they obtain it for a less price and are enabled to sell dearer. I tell you, some of our dealers are called cutthroats in the west, and would not escape lynching if they went there."

Mr. L. E. Jones, the secretary and treasurer of the company, entered while Mr. Atchison was talking, and ascented to what he said, adding an account of the Boston system, where there is a surveyor general and a fixed rule of inspection by which all lumber is both sold and bought. Much good lumber that comes here is sent west first to be inspected.

AMONG THE SPECIAISTS.

On the corner of Eleventh avenue and Twenty-first street the yards of Bell Brothers, who deal only in common spruce, or timber. In response to the reporter's question a member of the firm said that the prospect for the spring trade was never better. At the present time of year the wholesale price per cargo is from $15 to $18, which is a better showing than that of last year. The spruce comes mainly from Maine and the provinces, and at present the freights are high.

Three blocks above, on Eleventh avenue, is the large establishment of Eben Peck, who who deals exclusively in yellow pine wood. Mr. Peck was out when the reporter called, but one of his associates gave the necessary information. Some of the wood comes from Georgia, but the most of it from Florida. It is used for all building purposes, but principally for flooring, ceiling and wainscotting and all inside house trimmings. Its popularity has greatly increased in the last few years. In spite of its being the dull season for building and all masons' work the yellow pine is fair and prospects alluring.

With the specialists who deal in the fine, or hardwoods, such as mahogany, rosewood, and all cabinet woods, success is dependent upon different circumstances. They have little to do with the ordinary lumber interests, as they cater to an entirely different class—the furniture maker, not the builder. Their woods, besides, are many of them foreign, the mahogany coming from Mexico and the West Indies, and some of the other woods from Africa. The cherry and oak woods are in great demand now, and there is a steady call for mahogany. Mr. J. T. Williams said to the reporter that his business fluctuated with that of Wall street.

PINES AND POPLARS.

Mr. George F. Norton, of the firm of Norton & Christman, spoke of his present business and future prospects with complacency. The freights were high, something like $12 per M feet on hardwoods from the south. "One feature of the season," said Mr. Norton, "is the the large demand for whitewood which is coming more and more to take the place of pine. What is called white wood is really yellow poplar. It holds paint well and it stains better than any other wood, and hence is much used for weather boarding in fences and all exterior walls and planking. It is also largely used for coach panelling. Pine is be coming scarcer every day and the same quality of poplar is much less expensive. Desirable lumber is always saleable, and there is always a market for it in New York at a fair price. It is a rare thing to find a good firm with a yard full of dry lumber."

In Mr. Norton's office was Mr. Norcross, a southern manufacturer of lumber, who has come on here to build up a trade for his firm. Mr. Norcross has been very successful, and spoke of the excellent condition of the trade. In spite of the severest inspection he said that New York got the finest lumber and Boston the the next best. The poorest lumber is sent to Philadelphia, Baltimore and the South. "Lumber," he said, "is a staple product and prices do not vary much. I do not know of any business which can show as small a record of failures"

Mr. George M. Grant, of the firm of George M. Grant & Brother, cabinet and building lumber merchants, was next seen by the reporter. Mr. Grant deals largely in white pine from Michigan and some parts of Pennsylvania, and in all the other fine and rough woods with the exception of spruce. He said that the weather was disadvantageous at present, but that business was not bad and the spring prospect was very good. Mr. Grant's manner was not enthusiastic, but his haste testified that his business was beginning to feel the influence of spring already.

LUMBER AND LABOR.

Making his way up the mud-swamped avenue the reporter next called at the large lumber yards of Messrs. Crane & Clark. Mr. Clark was walking about the yard, and the reporter tackled him and walked with him.

"Well," said Mr. Clark, "trade with the builders, I should say, has been good this winter; but with the manufacturers, those who grow and saw lumber in preparation for the market, it has been dull. In our own case, the business of this year shows a marked increase over that of last year, and this in the general field, as we keep both hardwoods for furniture and pine, hemlock and spruce for building. And speaking of building reminds me of a very important matter. Very many more people would build if only the price of labor was fixed. The trouble is not with the lumber but with labor. Now, I read in the papers the other day that the painters and framers had agreed upon a fixed price and a fixed number of working hours. If this is so, it will prove a very good thing and indicates a very good tendency. In my opinion it is lack of confidence in the laborer that makes the men hold of from building. They fear strikes when their houses are half finished. If they could be certain of getting the labor at a price fixed beforehand and not subject to change, the building trade would receive a great impetus. It is not the highness of the price which deters them at present, but its uncertainty. As it is, the prospect for the spring is first rate."

A Halifax paper states that Messrs. I. H. Mathers & Co. have contracted with mill owners between Weymouth and Ohio for from 5,000,000 to 7,000,000 feet of spruce deals, &c, to be carried over the Western Countries Railway and shipped from Yarmouth to Great Britain.

The Beaumont Lumber Company, of Texas, recently received 1,500 logs that measured two to the 1,000 feet.

QUEBEC PUBLIC LANDS.

Mr. R. LAMIGAN has published a letter on the public lands in Quebec Province that contains much of interest to lumbermen, and we therefore give the following extract from it:—"The Government has about fifty thousand square miles of timbered lands licensed to lumberman. What does it know about these lands? Very little indeed. The purchaser of a timber berth has no title. Only the right to get his license renewed year by year till 1889. There is no inducement to husband his timber. The inducement is to cut it off, and realize his outlay, and this often to detriment of the timber market. Another reason for haste, is the fact that new townships are being surveyed, often in the heart of timbered territory, and if he does not cut his timber at once he will lose it. Strange, this selling to bogus or other settlers of the best timbered lots in his territory. These to retain their lots must clear land, and start fres. This is done in the face of the law which enacts that, "no person shall, at any time, set fire or to cause to burn, any tree, shrub, or plant growing, or standing in any forest, or at a distance of less than one mile from any forest." But you will say, "if he cuts it down he may burn it," just so. But he must not do so at any time between the 1st July and the 1st September. What does this law do to prevent forest fires? nothing, for it is never enforced.

"Every one who has thought of the preservation of our forests, claims that what are usually known as timbered lands, should be reserved forever as such. It is ruinous to bring settlers into a pine country, They cut down and burn more timber than would pay the price of their lands three times over. Fires started to clear, run and get into the forest, and as a a result, the explorer for timber often meets with miles of burned country in the vicinity of such new settlements. Legislation, as long ago as 1875, provided for the isolation and protection of timbered or forest lands, but up to the present day scarcely anything has been done to carry out the law. It is to be hoped that, in consideration of the increasing value of our timbered lands, the Department which has such matters in charge, will, before long, give the provisions of this law some practical effect.

"After all is said, it must not be forgotten that Quebec does not own a very large extent of pine bearing territory. Ascend any of the northern rivers which empty into the St. Lawrence or the Ottawa, for a distance of eighty or a hundred miles, and see where is the pine, and what is it like? As the height of land is reached the white pine grows short and shrubby, while further north you meet only with hard red pine or spruce, and at such a distance, these woods are not of any market value. It is presumed by those who have pretty fair facilities for judging that all the really valuable timbered lands of the Province are under license. It also pretty well known that large portions of these lands are completely denuded of pine. In fact, it has become so difficult of late years to bring timber and logs to driveable streams on account of the increased distances to haul, tha it tcosts the lumbermen one-half more to-day than it did twenty-five years ago. The Government has o more unlicensed, or virgin timbered lands for sale that are worth the buying, yet with these facts staring him in the face, one of those at the head of the Public Lands Department complacently exclaims, "happily for Canada we have not to create forests, only to preserve them." Holders of timber licenses to-day know that three years hence, some change will take place, both as to the renewal of licences, and the tariff on stumpage. In the uncertainty how Government will act after 1889, present occupiers of timber territory are hasting to cut all they can, with, it is to be feared, very disasterous results to the lumber market. It is very difficult to get the Government to show its hand; and with our short lived Cabinets, it is difficult to say who is in power in 1889. However, in the interim, it would not be injudicious for the present Government to give the holders of license some assurauce as to the course likely to be pursued by the C. L. D. after 1889. In fact, it would be only fair to our lumber merchants and the entire Province, that this were done without further delay. It is supposed that our mines are a source of wealth to the Province. We have gold, silver, galena, copper, asbestos, iron, phosphate, nickel, cobalt, antimony, graphite, mica, and all the materials for building, and the arts. What are all these worth to the Government? Why in 1884 and 1885 the Government received the enormous sum of five hundred dollars, and expended four thousand. This is about as good as expending ninety cents on an acre of land, and selling it to the settler for thirty cents.

"The fisheries did somewhat better, and yielded a revenue of three thousand two hundred dollars. Why not continue re-stocking our magnificent lakes and rivers, and thus multiply their value three fold? Our game, and fur bearing animals, grow scarcer year by year. Cariboo are about extinct. Red deer are seldom seen; while the bear, otter, and other fur bearing animals, are rapidly diminishing. If an efficient cordon were established around our forest reserves, and settlers kept out of these timbered territories, our game and our fur bearing animals would rapidly increase, and ultimately become a source of revenue to the Government, instead of an expense. However, these latter are but minor considerations, compared with the management of our woods and forests. This will at once become evident when we take into account that the revenue derived from these alone, amounted in 1884-5 to $660,757.13. Our neighbors south of forty-five are buying up our timbered lands and carrying off our saw logs to cut them up at their own mills. A small export duty was imposed on saw logs. Now, our neighbors tell us sawed lumber will not be admitted free into the United States from any country which imposes an export duty on the unmanufactured article. This is a bid to induce us to remove our export duty on saw logs; and strangely enough, at this very juncture, a paragraph appears in our Canadian newspapers saying it is almost impossible to collect this small export duty. Very well, remove the export duty, but impose a double tariff on stumpage, and let our Government give a rebate of one-half on all saw logs manufactured in Canada. The Canadian Government will not thus break faith with the limit holders, as regards saw logs, and some equitable arrangement could easily be come to with our square timber men. In any case, I hope our Government will not yield one inch to brother Jonathan."

SEASONING TIMBER.

The importance to the engineering the allied trade of being able to abtain a good and sufficient supply of thoroughly dry and well-seasoned timber is very great and yet is urgently wanted it can at times be hardly obtained at any price. The construction of railway and private carriages, for shipbuilding and Government military requirements, such as gun carriages, carts, ambulance and other wagons, with their wheels, and the manufacture of Mansell wood railway wheels, agricultural implements, etc., are a few out of many instances where large quantities of dry timber are wanted often at short notice. In the periodical cases of war there are large contracts, thousands of pounds in valve, often given out by the War Department for some of the above named articles to be made in the shortest possible time. As may be imagined, under these circumstances, the country is scoured in all directions by the timber buyers of the various contractors who will give almost any price that may be asked for well-seasoned planks, suitable for their purpose. Every little dealer in out-of-the-way places is visited and their small stock purchased, but, notwithstanding every effort, the stipulated time in which the work should be deliveced often expires before the material is brought together from which they are to be manufactured. The most severe inspection, too, is exercised by the arsenal officials, both of the contractors' work and after delivery at their destination, and all the woodwork showing the least signs of shrinkage, dead knots, sap, or even discoloration is at once condemned, and has to be taken out and replaced by other. The amount of waste is therefore very considerable, often being twice as much as the part really serviceable—even after the greatest care is taken to select suitable planks for which the highest prices are given.

Most of our large railway companies keep immence stocks of timber, both in logs and planks, which supply their own requirements, being kept sometimes for seven or eight years seasoning befere being used. The Midland Company for example, at Derby, have usually from seven to eight thousand logs of Moulmein Honduras mahogany, New Zealand kauripine, oak, ash, and other woods, besides immense stacks of Baltic redwood and other deals in stock, the total value being something over £100,000. The way usually adopted for seasoning timber is to cut the logs into planks at once, and stack them upright in racks in a drying shed, through which a current of air can freely pass, the sides and ends of the shed being constructed of narrow boards ranged vertically with a space of two or three inches between. The planks are kept apart from one another by pegs in the rack and are placed with the root end upward. If ranged horizontally in piles a space of about three forths of an inch is left between each board by means of pieces of stick upon which they rest. Thin boards and panels are generally kept in this way, and they are cleaned and shifted from time to time, as at stock taking periods so that they do not stop too long in one position and allow fungus to accumulate upon them. Much timber is kept in the open air for sake of room, but the ends are more apt to split than if kept under cover, owing to the alterations of wet, dry and, sunshine.

Although naturally dried timber is without doubt superior and much to be preferred, it is, from its scarcity and the time taking for seasoning—from three to seven years,—often supplemented for many purposes by quicker methods of drying, such as by stoves, kilns or steaming—many processes of which exist. In the United States most of the railway companies and carriage builders use kilns into which piles of planks placed upon trollies are wheeled upon rails running into the interior. The Pullman Palace Car Company, for instance, have a range of eight of these kilns, or "lumber dryers" on their premises under the Curran & Wolff patents, which has a storing capacity of 40,000 feet of one-inch plank, and which is capable of drying eight thousand feet every twenty-four hours.

The latest invention for drying timber, in common with many other things, is that claimed by Mr. Jennings, of Boston, Mass., a discription of which has recently appeared in one of the daily papers. By the "Cool Dry Air Process," as it is termed, the materials are placed in a chamber through which a continuous current of dry air passes. This current is previously drawn through a furnace in which it is heated to a temperature of about 600° F., which dries up all moisture contained in it, and afterwards cooled by a vigorous circulation of external air around the pipes containing it to about 90°, when it is propelled by fans through the drying chamber. In one of these chambers fixed at the saw mills of Messrs Smith and Co. Pimlico, it is stated that a quantity of birch weighing 45 cwt. 2 qrs. when put in was subjected to the process for 94 hours. It was then taken out and said to be thoroughly seasoned, its weight being reduced by the operation by 10 cwt. 2 qrs. 24 lbs. In the case of ash planks, too, out of 47 cwt. 3 qrs. of this wood, 21 cwt. 1 qr. of moisture was extracted, while 22 cwt. of mahogany gave up 5 cwt. of moisture in 96 hours. It is stated that planks of English oak two inches thick were finished in nine days that would have taken three or four years by natural drying. All the above effect were accompilshed by a current of 62,000 cubic feet per minute, the temperature of which never exceeds that of blood heat. Should the wood dried by this system be equally free from shrinking, warping, or other defects, and be found to stand the test of time as well as that of naturally-dried timber—which, however, we very much doubt, as hitherto all attempts in this direction have proved much inferior—a great future lies before it, as it will furnish a much needed supply of seasoned timber.—*Mechanical World.*

GILMOURE & Co.'s cut of logs this year is 740,000 pieces, and Rathbun's 650,000 pieces. The two cuts represent 115,000,000 feet of lumber.

THE CHAUDIERE.

It has been a well known fact for some time that the Shepard & Morse Lumber Company have been large buyers in this market for lumber to be cut during the ensuing season. The purchases of this company, as near as can be found from reliable information is about as follows:—

Lord, Hurdman & Co., 33,000,000 ft.
Grier & Co, 18,000,000 ft.
E. B. Eddy, 10,000,000 ft.
McLaren & Co., 8,000,000 ft.
Hamilton Bros., 4,000,000 ft. and about 5 to 10,000,000 ft. in different small lots, making the purchases of the S. M. L. Co. in this vicinity in the neighborhood of about 70,000,000 ft.

The Chaudiere mills output is estimated at 400,000,000 ft, made up as follows:—

J. R. Booth, 60,000,000 ft.
E. B. Eddy, 65,000,0000 ft.
Bronson & Weston, 60,000,000 ft.
Perley & Perley, 55,000,000 ft.
Grier & Co., 20,000,000 ft.
Lord, Hurdman & Co., 45,000,000 ft.
McLaren & Co,, 20,000,000 ft.
W. McClyment & Co., 15,000,000 ft.
Gilmour & Co., 55,000,000 ft.

This does not include the output of the following concerns, which rightly belong to this district, viz.:

W. C. Edwards & Co., Rockland, 50,000,000 feet.

Buckingham mills, (McLarens and Ross's) 35,000,000 ft.

Hamilton Bros,, at Hawkesbury, 50,000,000 ft.—*Ottawa Journal.*

A TERRIBLE ACCIDENT

The Perth *Courier* relates particulars of a fatal accident to John Hamilton, who was in the employ of Mr Peter McLaren, he had been driving Mr. McLaren's family round the town, and then proceeded to take the horses back to the stables at the farm. Here other workmen were engaged in cutting wood with a circular saw driven by steam, and Hamiltom requested one of them to put the horses up while he fed the saw, a work to which he was unaccustomed. He had not fed in more than two or three sticks when, probably owing to too much pressure being used, the saw burst. One piece struck Hamilton on the breast, and rent up his bowels, stomack and breast, cutting into his heart, and, of course, killing him instantly. The laborers were horror struck at the sight, and could do nothing but carry the dreadful news to their employer and the victim's family. The wife of the unfortunate man fainted away on hearing the fell tidings, and, even now has hardly recovered full consciousness. Deceased was only out from Scotland a short time, and was a steady good workman. He leaves a wife and two children.

THE MUSKOKA CUT.

The cut of pine timber in Muskoka this winter, says the *Herald*, so far as we have learned, been 80.000,000 feet, as follows:—

	Feet.
Onearo Lumber Company	18,000,000
Georgian Bay Lumber Co	22,200,000
C. Mickle	10,000,000
Thompson & Baker	7,000,000
T. B. Tait (Draper Mill)	1,500,000
T. B. Tait (Gravenhurst)	1,800,000
J. Tasker	2,329,000
Jas. Dollar	2,000,000
C. King	1,200,000
Leishman & Perry	2,000,000
John Collins	1,000,000
John Whiteside	1,000,000
Muskoka Mill and Lumber Co	10,000,000

THE Deseronto *Tribune* says that there are indications that the coming summer will witness brisk times in Deseronto. A very large force is at present engaged in the shipyard on the steamers Quinte, Armenia, Nile, etc., and on Mr. Evan's new venture, the construction of railway cars, a new department added to the shipyard. The large orders for lumber necessitate the employment of many men loading cars and sorting lumber in the yard department. Although the season is just commencing the sash and door factory is working to its full capacity to fill orders, and the cedar mill has a large staff at present on its pay list.

GRATEFUL—COMFORTING

EPP'S COCOA.

BREAKFAST.

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately flavored beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame."—*Civil Service Gazette.*

Made simply with boiling water or milk. Sold only in packets by Grocers, labelled thus:

A GIFT Send 10 cents postage, and we will mail you *free* a royal, valuable, sample box of goods that will put you in the way of making *more money* at once, than anything else in America. Both sexes of all ages can live at home and work in spare time, or all the time. Capital not required. We will start you. Immense pay for sure for those who start at once. STINSON & Co., Portland, Maine.

WILL NOT RECEDE.

The current opinion in this neck-o'-woods is, that the men who are deferring their purchases of lumber for a more convenient season, or are expecting more advantageous figures later in the season, will, in the vernacular of the street, "get left." It may be put down as an almost absolute certainty that prices are not going to recede, and those who wait for such conditions in the trade, will have some dearly bought experience before the close of the season, that they are doing business with less profit than if they had purchased earlier. "The early bird catches the worm," will be a pretty safe motto for the retailer as well as the wholesaler at the distributing centre to adopt in securing stock for the season's operatious. The reasons for the faith that is in us as regards the maintenance of prices, if not an advance, are that the logging season has been a very disadvantageous one. Too much snow or an insufficiency of it have been the ruling features of operations in the woods, and the strong probability is that it will be no better until the final break-up and cessation of operations in the pineries, and the log crop is destined to be insufficient for the full mill capacity on the Saginaw river, which has been decreased to the extent of about 75,000,000 feet by the destruction of mill property by fire. Added to this fact is another, that the stock of lumber and available logs at the close of operations last season was about 200,000,000 feet short as compared with the close of the season of 1884. This will leave a comparative shortage of 275,000,000 feet or thereabouts. This immense shortage must inevitably have a perceptible effect in stiffening prices which leaves any prospect of a decline very improbable to say the least. It will be observed therefore, that there is very little danger of the purchaser getting left through hasty action in securing stock for the coming season's business, but a very strong probability that delay may result seriously disadvantageous.—*Lumberman's Gazette.*

SOMETHING KNEW IN FANCY VENEERS.

The New York correspondent of the *Cabinet-maker* says: A continuous and perfect strip of veneer from ¾ inch to 30 inches in width and 300 or more long is an accomplished fact. E. Katz is the gentleman to whom the trade is indebted for the perfection of the idea. After much trouble and expense Mr. Katz has at last hit upon the necessary machinery, which he has now in running order, and is in a position to turn out a large quantity. The advantages rightly claimed for these veneers are numerous and we will mention a few of them. The veneer being stripped in "rolls" instead of "flitches" takes up less room and is more easily handled. The time and labor ordinarily required in piecing, patching and cutting of corners, etc., is saved, it being only necessary to take a strip of any desired width and cut any length required, the saving is the point alone being considerable. The figure of these veneers is equal, if not superior, to that of other veneers, When laid on, the absence of all piecing and patching is evident in the uniformity and unmarried beauty of figuring. To the experienced the many advantages of this mode of cutting will at once be evident that we do not doubt that there will be a great and increasing demand for these veneers as they become more widely known.

WHO MADE THE FIRST BARREL?

Few inventions have had a wider or more varied usefulness than the barrel; few give such promise of perpetuity. Unique in principle, simple, yet singularly perfect in plan and structure, the barrel is little less than a stroke of genius. Who set up the first one? Who first conceived the happy thought of making a vessel tight and strong out of strips of wood bound together with hoops. And when and where did he live?

No history of inventions; none of the encyclopedias in our great libraries; no historian of human progress, so far as we know, gives any information on the subject, unless we accept the Roman author, Pliny, who mistakenly attributes the invention to the Gauls who inhabited the banks of the Po. We say mistakenly, since there is the best of good reason for believing that the barrel was in use long before the Gauls took possession of their Italian home, perhaps long before the Gauls existed as a people.

The monuments of Egypt furnish proof of the early use of hooped vessels, though no date is given for their invention. In one of the inscriptions copied by Wilkinson may be seen two slaves emptying grain from a wooden vessel made with hoops, while a scribe keeps tally, and a sweeper stands by with a broom to sweep up the scattered kernels. Close by an unfortunate is undergoing punishment by bastinado for short measure, perhaps, or, as Mr. Wilkinson suggests, for petty theft. The measure is barrel shaped, and precisely like the *kayl* of modern Egypt. It would hold, apparently, about a peck. Unfortunately, the age of this inscription is not indicated. Measures of that sort would seem to have been in common use very early in Egypt, though not for the storing of liquids, for which purpose skin and earthen vessels were employed.

At first thought, Egypt would be the last place to look for the invention of hooped vessels its arid climate making it specially unsuited for their employment. Possibly, however, that may have been the compelling cause of their invention.

Throughout the East the bamboo is largely used for making hollow vessels, a section of the stem through a node securing a solid bottom, and one between the nodes an open mouth for a natural tub or bucket. In well wooded regions nothing would be more natural than the employment of hollow tree trunks for the same purpose, or sections of tree stems hollowed out bp fire or otherwise. In drying such vessels would split and spoil, and it would require no great genius to repair them by means of withes or wooden bands, the primitive form of the hoops.

If the users of such natural barrels should migrate to a more barren reason where timber was scarcer, economy of lumber would be likely to suggest the building of barrels from pieces artificially split, in short the use of staves, by means of which the primitive cooper would be able to make several barrels out of a block that would suffice for a single dug-out.

But this is speculation merely. It is enough to know that the cooper's art, like the potter's, is one of extreme antiquity. We had no suspicion of its age until we undertook to tell who made the first one.—*Scientific American.*

FLOUR AND FEED MILL.

A reliable and durable mill for the durable purpose of making flour and grinding feed is almost indispensable on large farms and to stock men, and can very often be run very profitably in connection with a saw mill. The "Union" flour and feed mill, manufactured by the Freeport Machine Co., of Freeport, Ill., meets the requirements in every respect. We present a cut of the mill and a description taken from the company's circular:—

This mill combines a principle with which coarse and fine meal, graham flour, chop, etc., can be ground more rapidly, and with much less power than with other mills, for the reason that we use annular cast steel rings in connection with best French buhr stones. The hard steel grinding rings are placed close to the centre, and are so arranged and adjusted as to crush the grains at or near the centre of the grinder, and to do it with much less power because of this, as it will be observed that the grain is first broken by the hard steel rings, and afterwards, by continual pressure, ground fine by the buhr stones, thereby reducing the frequent necessity of dressing the buhr stones, as is the case in other mills, hence the great value to planters, farmers, millers and users of ovr combined steel and buhr stone mill, which we can positively recommend to do better work and more of it, with less power than any other mill known. The 12 inch "Union" weighs 500 pounds, and when packed for export 650 pounds (and measurement 28 cubic feet); the driving pulley is eight in diameter, 5½ inch face, for 5 inch belt; 6 to 12 horse power is required to run the 12 inch "Union." The 16 inch "Union" net weight is 850 pounds; driving pulley 9 inches in diameter, 6½ inch face for six inch belt; requires six to fifteen horse power. Our "Union" mills have adjustable feed, and should 800 to 1,200 revolutions per minute. Just the mill for those having steam, water, tread or horse power. We believe our "Union" mills are indispensable to planters, farmers, diarymen and stock raisers. We furnish mills with or without a shaking bolt, and of a size sufficient to bolt as fast as the meal is ground, which works to perfection.

The 12 inch "Union" has 12 inch best French buhrs, and will grind from twelve to thirty bushels of meal per hour; the 16-inch "Union" mill will grind from 25 to 60 bushels per hour, depending upon the speed given.

CHARCOAL MAKING.

Kilns or ovens for reducing wood to charcoal are generally made of brick, and are of two kinds, the conical and the retangular. Charcoal is sometimes produced in open air pits, covered with earth. Our average New England forests will produce from 1500 to 2000 bushels of char coal per acre, in addition to some spruce and hard-wood logs. It is estimated that after the first cutting, provided young trees are preserved thrifty woodlands will yield a crop sufficient to produce 1500 bushels to the acre every twenty or twenty-five years. Hence every acre well wooded land has a large and positive money value, even after one crop is removed. Whatever may be realized from the forests produc s of an acre to-day, we may rest assured that in twenty-five or forty years the same amount of wood or timber will fetch more that the present selling price. The yield of charcoal varies but is usually thirty-five to forty-five per cent. of volume of the wood, and from eighteen to twenty-five per cent. by the ordinary methods, when the wood has been exposed two or three months in the open air after cutting. Well-made charcoal retains the form and structure of the wood, is brittle, somewhat cracked and very sonorous. If not burned enough, it is not black nor in the fracture bright One cord of wood yields about forty bushels of charcoal. Common kilns for burning 1200 bushels at one time cost about $400 each, where bricks can be obtained at reasonable prices. About 160 bushels of charcoal required to produce one ton of pig iron from the ore. A block of land measuring from 25,000 to 30,000 acres if well cared for, will permanently supply wood sufficient to manufacture all the charcoal needed for a common-sized blast furnace, say 3000 to 4000 tons per year —[*Ex.*

THE ONE-STAVE BARREL.

From the *Journal*, of Detroit, Mich., is taken the following concerning the one stave barrel:

"On the west side of the river Rouge, about three miles beyond the western limits of Detroit, on a site embracing between fifteen and twenty acres of land, the Anchor Manufacturing Company has built and is erecting several buildings for the manufacture of barrels by a new process. Hugh Mattulath is at the institution, and associated with him as stockholders, are Alanson Sheley, A. R. and W. F. Linn, A. S. Brooks, the Chandler Brothers, Peltier & Belanger, George W. Moore, Chas. E. Qottrell and William P. Fuller. The company has a paid up capital of $500,000. The establishment is now turning out 6,000 barrels per day, and will soon be making twice that number. While the size and shape of this barrel are the same as the ordinary one, the body of the barrel consists of a single sheet of timber held by hoops. The timber used is elm, which is cheap and abundant. Canada is the main base of supplies, and timber hunters sent there have already arranged for a year's supply for this establishment. The logs will be rafted over during the season of navigation, and brought by rail in the winter time. The logs are taken from the boom or yard into the saw mill, and cut into two barrel lengths. Thence they go into a steam chest, where they remain until thoroughly steamed. In this condition the log is converted into thin sheets, or veneering, used in the body of the barrel. By a special process, a two-foot log becomes rolls of wooden sheeting in a minute's time. There remains upon the mandrel an eight inch core, which is utilized in making barrel heads. The sheets go next to a sanding machine, by which both sides are made perfectly smooth. After passing through a cutting and grooving machine, they are so cut by a goring machine as to adapt them to the shape of a barrel. Thence they go to the drying-house. The latter is a building 50x400 feet, heated by steam. From the dry house they go to the sizing saws, where they are cut the desired length, when they are ready for the cooper shop or for shipment. They are shipped in bundles and in the 'knock-down' to be put up at their point of destination. Three thousand of them can be stored and forwarded in an ordinary box car. The headings are shipped in barrels. The factory is full of the finest machinery, and not a little of it is the product of Mr. Mattul luth's ingenuity."

AN EXTRAORDINARY OFFER.

To all Wanting Employment:

We want Live, Energetic Agents in every county in the United States and Canada, to sell a patent article of good merit, on its merits. An article having a large sale, paying over 100 per cent profit, having no competition, and on which the agent is protected in the exclusive sale by a deed given for each and every county he may secure from us. With all these advantages to our agents and the fact that it is an article that can be sold to every houseowner it might not be necessary to make an "extraordinary offer" to secure good agents at once, but we have concluded to make it to show, not only our confidence in the merits of our invention, but in its saleability by any agent that will handle it with energy. Our agents now at work are making from $150 to $800 a month clear and this fact makes it safe for us to make our offer to all who are out of employment: Any agent that will give our business a thirty days' trial and fail to clear at least $100 in this time, above all expenses, can return all goods unsold to us and we will refund the money paid for them. Any agent or general agent who would like ten or more counties and work them through sub-agents for ninety days and fail to clear at least $750 above all expenses, can return goods unsold and get their money back. No other employer of agents ever dared to make such offers, nor would we if we did not know that we have agents now making more than double the amount we guaranteed, and but two sales a day would give a profit of over $ 25 a month, and that one of our agents took eighteen orders in one day. Our large descriptive circulars explain our offer more fully, and these we wish to send to every one out of employment who will send us three one cent stamps for postage. Send at once and secure the agency in time for the boom, and go to work on the terms named in our extraordinary offer. We would like to have the address of all the agents, sewing machine solicitors and carpenters in the country, and ask any reader of this paper who reads this offer, to send us at once the name and address of all such they know. Address at once or you will lose the best chance ever offered to those out of employment to make money.

RENNER MANUFACTURING CO.,
116 Smithfield St., Pittsburg, Pa

WEST'S WORLD'S WONDER or family liniment has proved to be one of the greatest blessings of the age. It is a never failing remedy for rheumatism, cuts, sprains and bruises. Call on J. D. Tully & or a trial bottle and you will use no other

NOTICE.

SEALED TENDERS, addressed to the undersigned, and endorsed "Tender for Indian Supplies," will be received at this office up to noon on TUESDAY, 20th APRIL, 1886, for the delivery of Indian Supplies during the fiscal year ending 30th June, 1887, consisting of Flour, Bacon, Beef, Groceries, Ammunition, Twine Oxen, Cows, Bulls, Agricultural Implements, Tools, &c. duty paid, at various points in Manitoba and the North West Territories.

Forms of tender, giving full particulars relative to the supplies required, dates of delivery, &c, may be had by applying to the undersigned, or to the Indian Commissioner at Regina, or to the Indian Office, Winnipeg.

Parties may tender for each description of goods (or for any portion of each discription of goods) separately or for all the goods called for in the Schedules.

Each tender must be accompanied by an accepted Cheque in favor of the Superintendent General of Indian Affairs on a Canadian Bank for at least five per cent of the amount of the tenders for Manitoba and the North-West Territories, which will be forfeited if the party tendering declines to enter into a contract when called upon to do so, or if he fails to complete the work contracted for. If the tender be not accepted the cheque will be returned.

Tenderers must make up in the Money columns in the Schedule the total money value of the goods they offer to supply, or their tender will not be entertained.

Each tender must in addition to the signature of the tenderer be signed by two sureties acceptable to to the Department, for the proper performance of the contract.

In all cases where transportation may be only partial by rail, contractors must make proper arrangements for supplies to be forwarded at once from railway stations to their destination in the Government Warehouse at the point of delivery.

The lowest, or any tender, not necessarily accepted.

L. VANKOUGHNET,
Deputy of the Supeintendent-General of Indian Affairs.

Department of Indian Affairs.
Ottawa, 3rd March, 1886. 6d5

AUSTRALIA.

Messrs. Lord & Hughes' monthly circular, dated Melbourne, Jan. 23rd, says :—

We commence this year by issuing our regular monthly circular for the San Francisco mail, instead of the English mail as heretofore, as the information contained will be of later date for our American constituents, while it will suit our English and Baltic friends just as well; consequently, this circular will embrace all information in relation to building materials from the date of our last circular on 14th December last

Trade, since our last, has been exceedingly languid, consequent on the heavy arrivals of all descriptions of timber, and the disinclination of the trades to purchase beyond their immediate requirements, except at very low prices offered by speculators to store, waiting for a remunerative market. The season of the year has also operated prejudicially as the trade are busy with usual stock-taking, and have not wished to increase their stock until that is over.

We regret to have to advise lower prices in nearly every description of building materials—Oregon, Baltic, Canadian and American dressed and clear and Kauri pine. We can hold out no prospect of an improvement in the immediate future, as large stocks here, and known to be on the way, will prevent any advance for some time to come, except for exceptional lines that may be in demand.

Our land and property sales appear to have met with a relapse for the present, which also helps to prejudice the timber trade.

There is a fair business reported from the yards, and the trade do not report any falling falling off in business. We have to notice the retirement from business of Mr. Henry Mills, who for thirty years has been one of our most enterprising, plucky, and most respected buyers, and it is satisfactory to state that he retires with a competence.

RED DEALS.—Imports: 705 standard, 72,492 pieces from the Baltic, 5,421 pieces red pine from Canada. The arrivals have been Hama, China, Soudre, Inchgreen, Solid, Midnatssol, Magnet, Elizabeth, Bengal. Anthon, G. S. Homer, Tirade Tarabochia, from Baltic ports, and Malvina, from Montreal. The principal auction sales during the past six weeks was the cargo ex Hama, on the 12th inst., MB brand, when the following prices were realized :— 1x3, 6 1-16d ; 11x4, 6⅛d ; 9x4, 5⅞d to 5¾d ; 9x3, 5⅜d to 4½d ; 9x2, 5⅛d to 4⅞d ; 7x3, 5d to 4¾d 7x2½, 5⅛d to 4½d ; all per foot of 9x3. The cargoes ex Solid, Bengal, and Tirade Tarabochia have been placed privately.

SPRUCE DEALS.— Imports: 19,457 pieces. The arrivals have been Inchgreen, Midnatssol, and Elizabeth, from Baltic ports ; Paul Jones, from New York ; Malvina, from Montreal ; and Sovereign, from Saguenay. Sales by auction comprise parcel ex Steinvora, at 3½d to 3 1-16d ; shipments ex Palmerston, at 3½d to 2 15-16d ; and parcel ex Midnatssol, brand FWT, at 4½d to 3¾d ; and brand TWF, at 3⅛d per foot of 9x3.

OREGON TIMBER.—Imports: 7,112,267 feet super. The arrivals have been California, Gerard C. Tobey, Makah, Estella, Colusa, Sagamore, General Butler, and C. C. Funk. Sales by auction have been cargoes ex California, at £5 15s to £5, average £5 3s 2d ; ex Kitsap, £5 10s to £4 15s, average £4 19s ; ex Gerard C. Tobey, £5 5s to £4 15s, average £4 16s. The following cargnes have been sold privately :— Estella and Colusa.

LUMBER.—Imports: Clear pine, 1,100,921 feet super ; White pine shelving, 1,156,606 feet super ; T. and G. Ceiling, 113,169 feet super. The arrivals have been—Ragna, Chas. Dinnis, Glenesk, and Kamfjord from New York ; Paul Jones, from Boston ; Delphine Melaine, and Jorsalfarer, from San Francisco ; and Swift, from Adelaide. Sales by auction have been parcels ex Steinvora and Jorsalfarer. Michigan clear realized £15 5s. to £14 ; dressed clear pine, £12 12s 6d to £12 15s ; shelving £10 10s to £9 ; carpenter's clear, £11 , sugar pine, £13 7s 6d to £12 15s.

REDWOOD.— Imports; 317,297 feet super. The arrivals have been—Jorsalfarer, California, and Delphine Melaine, from San Francisco. The parcel sold at auction during the past six weeks is that ex Jolsaltarer, at £9 to £7 17s 6d.

FLOORING AND WEATHERBOARDS.—Imports: 21,220,076 feet lineal from the United Kingdom and Baltic ports ; 120,914 feet lineal from Canada. The arrivals have been—China, Soudre, Inchgreen, Thalatta, Telefon, Midnatssol, Gamli, Magnet, Elizabeth, Summerlide, Frigga, Anthon, George S Homer, and Waldimir, from Baltic ports ; Malaysia, Loch Etive, Lismore and Loch Katrine, from United Kingdom ; and Konoowarra, from Adelaide. Sales by auction comprise portions of cargoes ex Muncaster Castle, Soudre, and Midnatssol. We report prices as follows :—Red, 6x1⅛, 10s 3d ; 6x⅞, 8s 6d ; 6x¾, 7s ; 6x½, 5s 3d ; 4-out weatherboards, 5s 3d. White, 6x1⅛, 9s 6d ; 6x1⅛, 8s 6d ; 6x¾, 6s 6d to 6s 9d ; 6x½, 5s to 5s 3d

KAURI PINE —Imports : 1,288,000 feet super. Arrivals have been—Killarney, Myrtle, Buster, Parnell, Caindhu and Grassmere. Sales by auction have been flooring, ex Handa Isle and Buster, and dressed shelving and boards, ex Myrtle, and hewn logs ex Ansdell. We report sales, flooring 6x1⅛, 12s 6d ; 6x⅞, 10s to 9s 9d ; 4x1⅛, 10s to 9s 6d ; dressed shelving, 21s 6d to 19s 6d ; hewn logs, 12s to 10s.

PITCH PINE.—Imports : Nil.

CEDAR —Imports : 14,000 feet super. Arrivals have been per coasting steamers. There have been no auction sales since the date of our last report. We quote present value at 35s to 40s per log, according to size and quality.

DOORS.— Imports : 4,503. Arrivals have been Jorsalfarer and Delphine Melaine, from San Francisco; Paul Jones from Boston; Swift from Adelaide. The parcel of redwood doors ex Jorsalfarer was sold at auction on the 15th inst.

LATHS AND PICKETS.—Imports : Laths, 22,-227 bundles ; pickets, 19,008 bundles. Prices show a decline on last month's rate.

SLATES.—Imports : 1,109,396. The arrivals have been—Alliance, Borrowdale, Lake Superior, Halewood and Duncow, from United Kingdom ; Ragna Paul Jones, Charles Dennis, and Glenesk, from United States of America ; Orson, from Tasmania. In consequence of heavy arrivals, prices are easier. Several parcels have been sold privately, prices withheld. We quote American Bangor, 24x12, £11 ; 20x10, £8 Welsh Bangor, 24x12, £13 ; 20x10, £9 10s.

PLASTER.—Imports : 1,847 barrels. Stocks are heavy and prices lower. We quote 11s to 12s per cask.

CEMENT.—19,660 barrels. Arrivals are far in excess of requirements and prices lower ; we quote 12s 6d for best brands, and for inferior 11s.

GALVANIZED IRON.—Imports : 1,881 tons. Owing to heavy arrivals sales are difficult to effect, except at lower prices on last month's rates. We quote best brands at £16 ; other brands, £15.

EXPLANATION.— Red deals and spruce deals are sold at per foot of 9x3 ; T. and G flooring at per 100 feet running ; Oregon timber, Redwood, clear pine, shelving, ceiling, per 1,000 feet super ; Kauri pine and cedar logs at per 100 feet super ; laths, pickets and slates at per 1,000 pieces. Shorts are all lengths under 12 feet.

PREVENTING THE ENDS OF TIMBER FROM CHECKING IN DRYING.

Some English authorities have recently been making experiments upon the subject of drying timber without allowing the ends to check. After making a variety of tests, they report that by painting the ends of the stick with thick glue, and allowing it to harden, they succeeded in drying several kinds of lumber without having end checks make their appearance. The theory of the action was that they succeeded in forcing the glue far enough into the pores of the the timber, so that the ends were to a certain extent cemented together, and at the same time prevented from drying more rapidly than the body of the stick itself. Very little more has been made known in regard to this system, and we have been unable to get any particulars in regard to the kinds of wood employed, or the length of time they were subjected to the drying processes.

Mr. F. D. Adams, the General Master car builder of the Boston & Albany railroad, writing to us in reply to a query in regard to this system, says :—"I have never heard of glue being used on ends of timber to avoid checking. In fact, I should not think it would be of any use, as both the moisture from the timber and the rain, where lumber is stacked out doors, would in a short time destroy its strength. Possibly it might be of service, if timber was under good cover. We have been for years in the habit of covering the ends of our timber with a heavy covering of thick oil paint. This keeps the ends of the wood full, and prevents the water from getting in. Almost any kind of paint will answer the purpose."

In many of the lumber yards where foreign timber is received, it is the habit in stacking wide boards, to nail narrow pieces of laths over their ends. This prevents the too rapid drying of the end, at the same time binding the board aud preventing it from splitting. Even this, however, is not always sufficient to keep wide mahogany lumber from cracking badly.

Protection for the ends of all kinds of timber stacked so as to be exposed to the weather, is very essential, andthe rough oil paint is probably as cheap and as satisfactory as anything that has yet been thoroughly tried. In connection with this perhaps the most satisfactory investment of labor and material is found in the system adopted on the Lehigh Valley Road, by Mr. Lentz, also on a few other roads. This is to erect at the corner of each lumber pile four uproughts which carry a light roof sufficient to shed the rain and pretty thoroughly protect the pile beneath. In some cases, we have seen these roofs made like the roof of a hay rick, to be raised or lowered to suit the height of the pile beneath it. The cost of a construction of this kind is merely nominal and on some roads amounts only to the labor of putting up, the necessary timber being derived from rejected stuff which the lumber dealears do not consider worth removing—*Jour nal Railway Appliances.*

Wonderful is the instantaneous effect of West's Pain King in relieving cramps, colic and all bowel difficulties. Worth its weight in gold and costs but 25 cents. Should always be kept in every household. Sold by J. D. Tully druggist

Perhaps the most extraordinary that success has been achieved in modern science has been attained by the Dixon treatment for Catarrh Out of 2,000 patients treated during the past six months, fully ninety per cent. have been cured of this stubborn malady. This is none the less startling when it is remembered that not five per cent. of the patients presenting themselves to the regular practitioner are benefitted, while the patent medicines and other advertised cures never record a cure at all. Starting with the claim now generally believed by the most scientific men that the disease is due to the presence of living parasites in the tissues, Mr. Dixon at once adapted his cure to their extermination ; this accomplished the Catarrh is practically cured, and the permanency is unquestioned, as cures effected by him four years ago are cures still. No one else has ever attempted to cure Catarrh in this manner, and no other treatment has ever cured Catarrh. The application of the remedy is simple and can be done at home, and the present season of the year is the most favorable for a speedy and permanent cure, the majority of cases being cured at one treatment. Sufferers should correspond with Messrs. A. H. DIXON & SON, 305 King street west, Toronto, Canada, and enclose a stamp for their treatise on Catarrh.—*Montreal Star.* 1y122.

$100 REWARD

For any preparation that will equal **White Rose Cream** to remove Tan, Freckles and Pimples, Soften the Skin and Beautify the Complexion. Every bottle guaranteed to be as represented or money refunded, Price, 60c. and $1.00 per bottle. For sale by all druggists, or address the HARTLAND CHEMICAL CO., 27 Wellington Street East, Toronto. Stamps taken.

TROY, N.Y., Jan. 4, 1885.

GENTLEMEN,—I hav much pleasure in saying that I have used your White Rose Cream for my complexion some time past, and find it superior to anything I have ever used for the some purpose. It softens the skin and imparts a fresh and delicate bloom to the face and hands unattainable by the use of any other preparation. Sincerely yours, ELLA LOMANS.

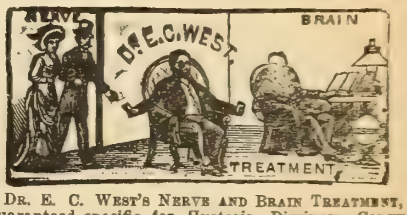
Johnston's Fluid Beef

The nourishing, palatable and warmth giving qualities of Johnston's Fluid Beef has caused this invaluable preparation to before a favorite and fashionable beverage for the winter season. It is now obtainable on draught at the leading hotels and restaurants throughout the Dominion 18t7

Health is Wealth



DR. E. C. WEST'S NERVE AND BRAIN TREATMENT, guaranteed specific for Hysteria, Dizziness, Convulsions, Fits, Nervous Neuralgia, Headache, Nervous Prostration caused by the use of alcohol or tobacco, Wakefulness, Mental Depression, Softening of the Brain resulting in Insanity and leading to misery-decay and death, Premature Old Age. One box will cure recent cases. Each box contains one month's treatment. One dollar a box, or six boxes for five dollars ; sent by mail prepaid on receipt of price. We guarantee six boxes to cure any case. With each order received by us for six boxes, accompanied with five dollars, we will send the purchaser our written guarantee to refund the money if the treatment does not effect a cure. Guarantees issued only by J. D. TULLY Druggist, Sole Agent for Peterborough

Advertisements intended for insertion in any particular issue should reach the office of publication at least four clear days before the day of publication, to insure insertion.

All communications, orders and remittances should be addressed and made payable to THE PETERBOROUGH REVIEW PRINTING AND PUBLISHING COMPANY (LIMITED), Peterborough, Ont.

Communications intended for insertion in the CANADA LUMBERMAN, must be accompanied by the name of the writer, not necessarily for publication, but as a guarantee of good faith. Communications to insure insertion (if accepted) in the following number, should be in the hands of the publishers a week before the date of the next issue.

The CANADA LUMBERMAN is filed at the Offices of MESSRS SAMUEL DEACON & CO., 154 Leadenhall Street, London, England, who also receive advertisements and subscriptions for this paper.

PETERBOROUGH, Ont, MAR. 15, 1886.

BRIDGES.

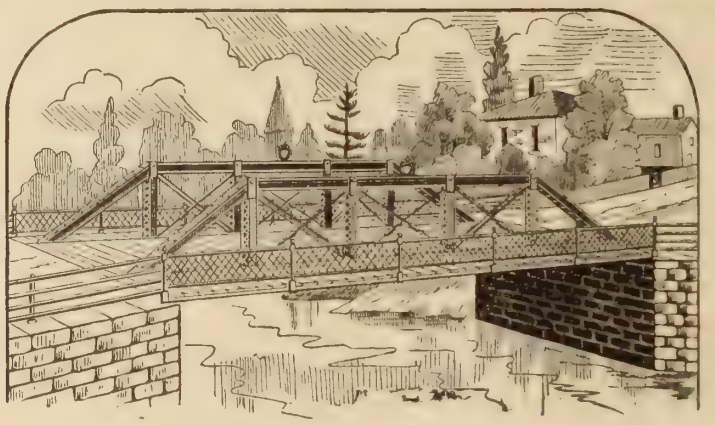
Written for the Lumberman.

Bridges are structures made to span a void, and are as old as history. From the Greeks we have accounts of bridges built by Semiramis, Darius, Xerxes, and Pyrrhus, principally made of timber and flat stones. Sometimes boats moored in the stream served as piers; such was the bridge built by Xerxes across the Hellespont. The principle of the arch was first applied to bridge building by the Romans. The Ponte de Ritto, or Senators' Bridge, erected by Caius Flavius, (127 B.C.) is supposed to be the first instance of its application to bridge building. In the course of the great engineering works of the Roman Empire, the application of the arch for bridge building became general and bridge building became an art. After the decay of the Roman Empire it made no progress for several centuries, but was again revived in the Eleventh century, but we find little was accomplished until the beginning of the Eighteenth century, when a large number of splendid bridges were erected in England and France.

One of the first applications of iron, to the building of bridges, was about the year 1775, by Mr. Pritchard, of Shrewsbury, England. This was a cast iron arch bridge, which proved a very valuable style of construction, and has since been largely used in all parts of the world. During the present century wrought iron and steel have been very extensively used for bridge building, and are fast taking the place of all other materials. Among the earliest applications of wrought iron to long span bridges, were the Britannia and Conway bridges, these were what are called tubular bridges, their cross section being in the form of a rectangular tube. The Victoria bridge, of Montreal, is another example of this type of bridge. The total amount of iron used in the two former bridges was 2,892 tons. The greatest span in the clear is 460 feet. Since that time the use of wrought iron and steel for building of bridges has been very extensive, until to-day we have a bridge at New York of 1,600 feet in one span, and another now being erected across the Forth, in Scotland, that the spans will be 1,750 feet long. The Niagara bridge is 1,200 feet, and the Cantilever bridge across the same stream is a later example of modern engineering skill.

The essential elements of a good bridge consist in so applying the materials of construction to a given design as to have all parts of the structure equally strong under the greatest loads that can ever come upon it. At the same time the material should not be strained to more than one-fourth to one-tenth of their ultimate strength, depending on the kind of materials used, and the nature of the stress the materials are subjected to. Bridges so constructed are said to have a factor of safety of 4, or 5, or 6, etc. Ordinary iron highway bridges are usually constructed with a factor of safety of four, which is ample, unless built in large towns or cities, then they should be constructed with a safety factor of five. Railroad bridges, as now built, have a factor of safety of five, and some of the members of the bridge that are subject to sudden shocks have a much higher factor of safety.

Bridges are subject to two kinds of loading besides their own weight, such as a uniform weight distributed over the whole length and width of the structure, and by concentrated loads such as heavy loads of timber, stone, machinery, threshing machines, and in the near future bridges will have to carry heavy traction



THE NEW PIGEON CREEK BRIDGE.

engines, and this should not be overlooked by city and county engineers in their future bridge designs—more especially in short span bridges, on which the shocks from heavy loads are more severe than on long span bridges—therefore, they should be designed to carry heavier loads, or the factor of safety increased. The general standard for loading a bridge is to consider it crowded with people. This would not exceed eighty pounds per square foot of bridge flooring. The following loads per square foot for different lengths of span were recommended by a committee of bridge experts in the U. S. A. to be adopted for the building of highway bridges:

60 feet spans and under 100 lbs. per square foot.
60 " to 100 ft. span.. 90 " " "
for cities and large towns.
" " " .. 80 lbs. per square ft.
for county roadway.
100 " to 150 ft. " .. 80 lbs. per square ft.
for cities and large towns.
" " " .. 65 lbs. per square ft.
for county roadway
150 " to 200 ft. " .. 70 lbs. per square ft.
for cities and large towns.
" " " .. 60 lbs. per square ft.
for county roadway.

The proper strength of floors for all spans may be arrived at by taking into consideration the greatest loads that are likely to be concentrated on one pair of wheels for each roadway. For Cities and large towns we can consider this not to exceed five tons, and in county roadway bridges three tons. This may appear extreme, but the writer thinks the error, if any, is on the side of safety. The floor beams of all bridges should be constructed for the above mentioned loads. The longitudinal stringers or joists should receive the same attention and should be of sufficient strength to carry half the above mentioned loads on one wheel concentrated in the middle of its length.

In the construction of iron bridges great care should be taken in the selection of the materials used for that purpose, as the whole structure may fail through some defect in one of the members, and as thousands of people intrust their lives on such structures daily, it is a point of vital importance, and cannot receive to much attention, not only by the engineer of the works where the bridge is manufactured, but by every workman engaged on the work, who should immediately report any defects he may discover no matter how trifling.

Iron is a material, the qualities of which are as variable as the different ores from which it is produced; it may be good, or very bad, or a mean between the two, and to a person who is not familiar with the material, and its mode of manufacture, all would appear alike. Iron is a material the most sensitive to treatment of any metal known in art. The least and often the smallest variation in the quantity or quality of the fuel, ore, or working, will result in several grades of iron at the same cast, but each grade suitable for some purpose. The writer has frequently seen four and five grades of iron produced at the same cast, although the same quality and quantity of ore and fuel had been used during the melting. The pig iron is commercially graded, and called Nos. 1, 2 3 and 4. Nos. 1 and 2 are always selected for foundry use, and are sometimes called grey irons, whilst the higher numbers are used for the purpose of manufacturing wrought iron, and are sometimes called white iron or forge iron. Foundry pig iron may be recognized, when broken, by the fracture presenting an open, crystaline texture with a grey color. Forge pig iron is hard, fine-grained, and generally has a white appearance, and sometimes a mottled one.

The operation of producing wrought iron from the pig iron, as now practised, is by extracting the carbon, and other impurities, by means of the flame and heat in a reverberatory furnace. The process is called puddling and is thus conducted: The sole, or centre part of the furnace, is filled with broken pig iron, rich slag, or iron scale, the doors are fastened up tight, the fire is then kept up until the whole mass of iron, slag, etc., are melted by the flame passing over the metal, (no fuel is allowed to be in the chamber with the metal). When the metal begins to melt the puddler begins to stir the same with iron bars made for that purpose, (a small hole about six inches square being left in the bottom of the door to admit of these bars being readily taken in and out). After it has all become melted the whole mass is rapidly stirred up. After a time the mass will boil and the carbon in the iron, in the form of carbonic oxid, comes to the surface, and comes in contact with the flame from coal in the fire chamber, and burns off with a blue flame. The stirring of the mass is kept up until all, or nearly all, the carbon is burnt out and the metal becomes pasty. The temperature of the furnace is now lowered by a damper in the stack, and the particles of the pasty iron gathered together and made into balls, about five or six balls at each charge, after the balls have been sufficiently worked they are taken to a heavy hammer or squeezer and there hammered or squeezed until a large quantity of the slag and other impurities remaining in the iron are forced out, it is then taken, whilst hot, to a set of rolls and rolled into bars about four inches wide and one inch thick. After remaining till cold it is cut u into short pieces, the several pieces are piled one on top of the other until they make a pile of sufficient dimensions to make a bar of iron of such merchantable size as may be required. The pile is then reheated and brought to a welding heat, about 13,400 degrees F. and again rolled into bars,—this is the ordinary merchant bar iron.

Upon this first process of puddling the quality of the iron almost entirely depends, that is supposing the pig iron has been made from good ores, (good iron cannot be made from poor ores, but bad iron can, and is made from the best of stock.) If the iron is not properly worked it will not have that toughness that good wrought iron should have. Again, if the charge is left to long in the furnace, the iron will be injured from over-heating, bars or plates made from either iron would be of bad quality, but both irons would not have the same granular appearance when broken.

The chemical operation performed during the puddling process is called decarburizing, and if it was possible to perfectly accomplish it, and the pig iron contained no impurities, the result would be pure metalic iron. This has never been accomplished so far, therefore the different grades and qualities of iron to be found in all parts of the world.

But with all the difficulties met with in the manufacture of iron, metallurgists have been able to produce a good and reliable quality of wrought iron by a judicious mixture of the various brands of pig iron, and by testing the puddled bars and selecting such as are fit for the quality of bars or plates required. Therefore, if an inquirer knows what quality of iron he wants, he should have little difficulty in procuring it if he deals with a reliable manufacturer. At the same time it is necessary that iron should be tested, and one of the best and simplest forms is what is termed the cold-bend test. It consists in bending the bar under examination, over an anvil by repeated blows from a hammer until the sides approach each other within a distance equal to the thickness of the iron. Iron that will stand this test without fracture is of the very best quality, possessing ductility, toughness and elasticity, and highly suited for bridge building. Some high grade irons will stand a severer test than this, by the sides being closed down upon each other, but these are exceptional cases and not the rule. Under no circumstance will iron stand to be bent over the sharp edge of a vise without fracture. The test piece should be bent over something that will allow the inner fibres to upsett at the time the outer fibres are extending. Thousands of tests have been made which all go to show that for bridge purposes a bar one inch square should be able to withstand a pulling strain of 50,000 to 54,000 pounds before breaking, and that it should stretch at least 1½ inches to the foot before rupture.

Timber for bridges should be sound, free from shakes, heart-cracks, loose and black knots. Well seasoned timber will wear much longer than unseasoned, but bridge plank is seldom kept in stock, therefore it must almost always be procured fresh cut from the mills. Sapwood will not wear good, and will decay faster than heartwood, but it is practically impossible to get all heartwood. Wane edge should be laid downwards, and if more than one wane edge in a plank it should not be used.

The timber for stringers, or joists should be selected with more care than plank. The kinds of timber most in use are oak, white and yellow pine; for plank sometimes hemlock, beech, birch and tamarack.

The principal kinds of iron bridges now in general use are the girder bridges, for short spans up to 30 to 40 feet, sometimes longer. Next comes the bowstring, the arch, supension, truss bridges, and lately the cantilever bridge has been brought forward very prominently. This last mentioned type will be more extensively used in the future than in the past for long spans; although the principle has long been understood by engineers it is only of late years that such gigantic structures have been built where the principle could be applied with economy.

The truss bridge is the most in use, and

bridges have been built on this principle, in spans ranging from 30 feet to upwards of 500 feet long. There are several types of trusses, such as the King post truss, the Queen post truss, the triangular or Warren truss, the double triangular truss, the trapizoidal or "whipple" truss, the Fink truss, the Bollman truss, &c. The two former types are only used in the shortest spans. The trapizoidal or whipple truss is most in use and some magnificient structures have been built up to 525 feet spans. The illustration given is of the whipple type and is called a low truss bridge. The length of span is 68 feet, width of roadway 18 feet, with a sidewalk on each side four feet wide. The bridge is designed to carry a rolling load of 100 pounds per square foot of the roadway, and 80 pounds per square foot of sidewalk, besides the weight of the superstructure itself. No member in tension to be strained to more than 10,000 pounds per square inch, and compression members 8,000 or less, depending on the ratio of length to diameter of the member. The sidewalk railing is made of wrought iron lattice work bolted to cast iron posts, said posts being bolted to the iron cross beams, the flooring is entirely of pine, roadway plank three inches thick, sidewalk plank two inches thick, the whole superstructure is erected on a cut stone substructure and crosses Pigeon Creek, in the town of Omemee, Victoria County, Ontario. In long span bridges, from 90 feet and upwards, the trusses are of sufficient height to be braced laterally on the top, these are called high truss bridges. Sometimes the roadway is carried on the top of the trusses, and this is called a deck bridge.

Before building a bridge all corporations should consult a competent engineer, who would be able to select the most economical and best type to suit the location, and also to examine the designs and plans presented, to ascertain if they are designed on correct and recognized principles, *and to ignore any plan that is not, or cannot be analyzed as to the kind and amount of strain the members of the bridge would be subject to when loaded.* It is almost criminal to build a bridge, or any structure, on plans that no one can tell approximately anything about, when there are plans that are thoroughly understood and the strains can be correctly calculated.

There is another point to consider and one of the most vital importance, namely, the details, or connections, of the different members of the bridge, if these are weak the whole structure will be measured by their strength. On these points the knowledge of the practical engineer is of great value, it enables him to select the best design, and prevent incompetent and unscrupulous parties from palming their death traps on the public, besides saving large sums of public money.

W. H. LAW,
Central Iron Bridge Works, Peterborough.

THE DUTY.

To the Editor of the Canada Lumberman.

MR. EDITOR,—Mr. Joly's letter in your number of the 15th, with your remarks in answer to the *Free Press*, give valuable information on our lumber interest. I have often wrote and wondered the reason why the export duty on our cedar, spruce, and pine logs are not exacted on the river St. John, N. B., when one steam mill on the American side manufactures about 50,000,000 of cedar shingles, besides the spruce and pine for clapboards, furnished yearly from our forests free of export duty.

It seems astonishing that we have been, for the whole of the Nineteenth century, living alongside of a smart shrewd people who have thrown off the old John Bull bigotry over one hundred years ago, and we yet inherit it to such an extent we must butt our brains out against obstacles to progress before we can see them.

If we had a few more Mr. Jolys, with an independent press, who takes the interest of our country at heart, the Government might condescend to open their eyes and look after our local interests and protect them. And unless we encourage and protect all the feeders, to keep up our revenue, our progress must be retarded; and lumber is one of our natural and most valuable feeders. Costing us nothing is the reason why it is so neglected, and the day is not far of when our future generations will curse the neglect and those causing it.

I see that the Morrison tariff, if it passes in the United States, throws a sprat at Canada to catch a salmon. It reads to admit all wood and lumber, *not dressed*, on the free list, from a country where no export duty is charged; consequently all our shingles and clapboards, when a planer has been used on them, would be subject to duty, and nowadays all our shingles are edged with a planer, and nearly all our clapboards are planed at the mill where they are manufactured. So it stands our Government in hand to not let go with their right hand before they get a good hold with their left, for they will learn there is no friendship in trade with Uncle Sam.

And about our New Brunswick stumpage few of your readers know nearly all our lumber lands are locked up by monopolists who charge $1.50 per M feet stumpage, and what little lumber we have left, if not preserved more strictly, the reckless slaughter now carried on by Americans, and our own lumbermen, we will soon have none to growl over.

Respectfully yours,
P. O. BYRAM.

Madawaska, February, 1886.

ENTERING the townships of Melbourne we are impressed with the rapid growth of wood. In places that were cleared, since our personal recollection, and cultivated for years, thers now appears a strong and healthy growth of maple and other varieties of wood. Some of the trees are nearly large enough for sugar trees. If the country were left for fifty years, the landscape would be converted into an unbroken forest again. If people would only husband the wood growing patches that remain, keeping the cattle and fire out of them, there will never be a scarcity of wood in these townships. —*St. John, Quebec, News.*

WE learn from the Brandon, Man., *Sun* that Mr. Jas. Kennedy, son of Mr. D. Kennedy, of Campbellford, Ont., is manager of the Brandon saw mills, which the proprietor, Mr. Christie, lately purchased. 800,000 feet of logs are now in the Fort Ellice booms, and will be sent down as soon as the ice breaks in the river, and arrive there ten days after. It is the intention this season to cut one and a half million feet of lumber. Forty men will be placed in the woods above Fort Pelly this week. This will be pleasing news, the *Sun* says, to the people of Brandon.

THE Pembroke *Observer* of February 26th says:—"The timber shipping traffic for the season of 1886 has opened under the most favorable auspices and a busy season is predicted. Mr. Klock, the well known lumber merchant, of Aylmer, has started a force of men to load cars with lumber cut this season on the Veuve river. The timber will be launched on the ice Papineauville, where it will be rafted up as soon as navigation opens in the spring and driven to Quebec for the early market.

MR. FLOOD, the agent for Messrs. R. R. Dobell & Co,, is at present taking out square birch in the vicinity of Lac Sept Isles, near St. Raymond. Already 12,000 feet have been sent down by the Quebec and Lake St. John railway, and have been piled on the Louise embankment. Eight thousand feet more have to be delivered. The average of this birch was 16 inches and 11 feet in length.

ALLEN OLMSTEAD has been appointed forester for the Adirondack region, N. H., by the state forestry commission. He is an old hunter and a thorough woodsman. His duty will be to see to the preservation of the forests under his jurisdiction from wanton destruction and spoilation.

WHILE engaged in surveying lumber at Malone for the Rathbun Company, Mr. Thomas Pidgen slipped off a lumber pile and fell against a log sustaining very severe internal injuries which have entailed much suffering. He was taken to his home in Deseronto.

DURING 1885 car loads of lumber and box shooks were forwarded from Potsdam, N. Y., to the number of 1,463; car loads of butter tubs, 165; bark, 29.

A MAN was hit in the right eye by the bursting of a log bind, in a shanty at Mattawa, and taken to Ottawa last week. He has has sustained fearful injuries about the face, and it is feared that the eye is totally destroyed.

THE Cobourg *Sentinel-Star* says that the hickory wood in the buggy which John Boyd, of Baltimore, has sent to the Colonial Exhibition, London, England, was taken from a tree planted by the late Hon. Asa A. Burnham, over 50 years ago.

A SYNDICATE of Quebec gentlemen, including J. E. Ross, E. Beaudet, H. J. Beemer, Andrews, O. Turgeon and others, are about to erect a large saw and shingle mill and furniture factory at River Pierre, on the line of Lake St. John railway, province of Quebec.

FOR SALE

VALUABLE

Timber Limits

AND

50,000 SAW LOGS

ON SEVERN RIVER

The undersigned being desirous of confining their operations to their Lakefield Mills on the Trent waters, offer for sale the following limits:—

Township of Hindou, 70 square miles.
" Oakley, 45 " "
" Redout, 22 " "
An area of 137 square miles.

These limits are estimated to contain 180 million feet of Logs, well watered, and afford means of short hauling from all points, and quick and cheap driving to Georgian Bay. Are offered for sale together with plant, depots, farms, 1,200 acres deeded lands and 50,000 logs, nearly all of which are on the main river, a large proportion of which are 16 feet long. Apply to

R. & G. Strickland,

3mL LAKEFIELD, ONT.

Take Notice

J. J. Turner has Something to Say.

If you want a good AWNING or TENT, send to the manufacturer who makes a business of it. Having had over twenty-five years experience in this business, parties in want of anything in my line are sure of getting satisfaction. Tents of every description in stock and made to order. Also Horse and Waggon Covers, Rick Cloths, Waterproof Clothing, in fact anything and everything from a needle to an anchor.

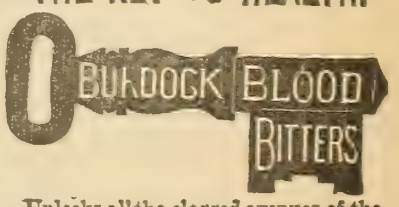
NOTE THE ADDRESS:

J. J. TURNER, Sail, Tent and Awning Maker, East Pier, Port Hope. d39t

MEN ONLY

A quick, permanent, absolutely certain cure for lost or failing manhood, nervousness, weakness, lack of vigor, strength and development, caused by indiscretions, excesses, etc. Benefits in a day; cures usually within a month. No deception nor quackery. Positive proofs, full description, hundreds of testimonials, with letter of advice mailed in plain, sealed envelopes, free. Erie Medical Co., Buffalo, N. Y.

THE KEY TO HEALTH.



Unlocks all the clogged avenues of the Bowels, Kidneys and Liver, carrying off gradually without weakening the system, all the impurities and foul humors of the secretions; at the same time Correcting Acidity of the Stomach, curing Biliousness, Dyspepsia, Headaches, Dizziness, Heartburn, Constipation, Dryness of the Skin, Dropsy, Dimness of Vision, Jaundice, Salt Rheum, Erysipelas, Scrofula, Fluttering of the Heart, Nervousness, and General Debility; all these and many other similar Complaints yield to the happy influence of BURDOCK BLOOD BITTERS.

T. MILBURN & CO., Proprietors, Toronto.

JIM AS AN ENGINEER.

Jim's a good-natured happy-go-iucky; he's served his time in the machine shop, knows all about blacksmithing, and as for a stationary engine, why bless your soul, he's designed more than you ever saw. His uncle was a big stockholder in the company, and Jim was sent up to make himself generally useful, and show the country bumpkins a thing or two.

When he came all the places were full, so Jim swept up the shop and did some helping. To be sure, he left some chips under the laths and the bench was not very clean; but you know, Jim was an engineer and machinist, and not a roustabout.

At last business picked up and Jim was set to work running the engine nights. Then he was in his glory. First he thought the globe valve on the feed-pipe ought to be shut. Of course he forgot to open it when he started the pump. Well now you just ought to have seen that packing come out, and the water squirt over the engine and machinery. Jim caught a good mouthful and then left, and never stopped till he was out-doors. It rather scared him, but in a night or two he was ready to try another dodge.

The pump didn't leak, but Jim thought it needed packing, or anyhow that gland must be screwed up, and up it went; and the first thing he knew the plunger stopped, stuck tighter than a drum. Well, the engine went on serenely, and the set screw that was to have held the crank cut a nice little groove around the shaft.

Now that valve and motion is all of a kilter, and needs resetting. So one night while the men were at lunch, off comes the steam-chest cover, and the valve *is* reset. Engine starts a little lame, but Jim knows she will soon get over that. But pretty soon there is a rattle, the engine limps worse and worse, and then with a final rattle she stops. Investigation showed a nut off the valve stem. It had dropped into a steam port, been blown out into the exhaust and up the smoke stack, till it struck the elbow, when it dropped back upon the vertical boiler, where it was found next day.

Then Jim thought that perhaps it was not the valve after all. The pound must be in the eccentric straps, and I'll just tighten them up Well, now, almost before he could put that monkey-wrench down on the bench there was a loud snap, and a broken eccentric rod went whirling around with the shaft. This time the eccentric and strap were both cut and the rod broken. Jim smokes away and says the engine is no good. Manager thinks about the same of Jim's engineering qualifications, and gives him a job where he won't have quite so good a chance to raise Cain, but Jim was still alive, and didn't fail to let us know it.—*Power.*

CARE OF EMERY WHEELS.

It is common custom when an emery wheel is removed from its spindle to abuse it. Some hang it up on a nail, with one side exposed to the air of the room and the other side against a damp brick or wooden wall. Others lay it about on an uneven bench, and others, again, take the trouble to put it under the bench, one edge against the damp ground and the top side leaning against the back of the shop. When they want to use it again they find it all out of balance, perhaps warped out of flat and with its corners chipped or damaged. Then they write the maker that the wheel doesn't run true, and they want another one for it, without charge, or they will, notwithstanding its damaged condition, mount it on the machine and go to work with it; when it bursts and mains the user, emery wheels will be called dangerous tools.

To much care cannot be taken of an emery wheel by the man who uses it. Emery is, as before stated, a silicate of alumina and iron, emery contains water enough to make it have an affinity for water, and to a certain extent oxidize or rust, and therefore swell in size. If, then, a solid, but porous wheel is subjected to dampness, or to unequal action of air and dampness, it may become injured. It certainly is injured by having the corners chipped off by lying about under a bench with old junk, and it should get more sensible treatment.

A good plan for keeping all emery wheels would be to lay them in a box or drawer, in dry sand or sawdust, keeping them with as much care as one would with an edged tool or razor. Too much care would do no harm.

If, upon receiving an emery wheel from the maker, the user would tap it lightly with a hammer, he will find it has a note or sound Now, if when he uses the wheel after an interval of repose, he would again tap it lightly with his hammer in the same way, he will notice readily any change of sound, or ring. If the wheel, on being tapped, sounds dead, or if it is cracked, he will readily notice the change in sound. This change is the only intelligence any solid wheel possesses; the man who uses it must govern himself accordingly. —*Mechanical Engineer.*

CARE FOR CIRCULAR SAWS.

The care we take of a circular saws makes it possible to do either the poorest or the best work. We may have the very best table, the finest gauges, and the best saw the market affords, but unless they are well taken care of it is utterly impossible to do a nice piece of work with them; while on the other hand, if we keep them in fine condition, even with indifferent tables and appliances, they will show their care by the superior work done. Even under imperfect conditions aside from the saw, if we keep it sharp it will cut easy, and if set perfectly true, with the teeth of an even length, it will cut smooth, though it stick up through a rough board instead of a table made of alternate strips of walnut and ash, shallacked to perfection and polished until you can see your face in it. There is a combination of things that makes a saw run well, as much as there is a combination of letters to make a word, or of figures and signs to make a problem in arithmetic; and unless the combination is perfect we fail to make good work.

Let us see what the combination is then if we agree to the conditions specified: 1st, a true plate; 2nd, an even set; 3rd, the teeth all of an even length, so that each tooth shall do its share of cutting; 4th, the teeth filed to a uniform level both front and back, so as to give all the points the same shape; 5th, and last, though not by any means least, to give all the teeth the same size and shape without regard to the level. The reasons why we should have a true plate are obvious to the most casual observer. The stiffness of the plate depends on its being true, for just as soon as it is the least sprung, it has lost its backbone, and it will be dished first on this side and then on that, and we cannot trust it for anything, even the very plainest kind of sawing.

There is a wide difference of opinion about a sawyer straightening his own saws; while one may be able to do it there a thousand who cannot do it well. This is a part of caring for saws that if one cannot do it well he had very much better not try to do it; and yet every sawyer should be able to tell when a saw is sprung, and have it taken to a professional in that business and have it made right, for it is very much cheaper to have it right in the first place than have some one try to learn how to hammer a saw and almost ruin it and then be obliged to have to take it to some one in the business. This is a poor way to save money, and if any one is just starting and with a small working capital, he has little time to spare to teach his workmen how to hammer saws. But you want to know just when a saw needs straightening, and have it well done, and you want to know enough about a saw to know when it is well done. This is one part of caring for saws, and whether one can straighten a saw himself, or can tell when it ought, to be hammered, he in either case is properly caring for it. It is needless, perhaps, for me to say it, but it is nevertheless a patent fact, that not one in ten sawyers in the country properly understands this part of the business or has the right kind of tools to do either the one or the other.

We would now come to the second part, a true, even set. A saw perfectly round and each tooth as long as the others might perhaps come in first, but as I have taken up setting we will go on with it and take the length of teeth in its turn.

There are a very few persons in this world that can set a saw by their eye and never use a gauge, but those persons are almost as scarce as hen's teeth, and the best way to use a good gauge and have each tooth come just to it, and not almost to it and another a little too much out, for these two littles make a "mickle" and will surely tell on the stuff being sawed.

On ordinary coarse work, like ripping up plank for studding, or for any stuff to be planed and jointed in a machine, I would certainly use an upset, as this keeps the outside points of the teeth full and sharp, which is a very necessary point in making a saw run well. As soon as the outside points become rounded, no saw ean be trusted to do good work even in the coarser kinds of sawing, but they do very much better even then if they are properly set by having every tooth set just alike. I know this point of setting is held in high esteem by many who call themselves good sawyers, but I hold that it is one of the positively essential points to make a saw run both easy and well.

Now we come to the third count, keeping a saw round, and every tooth exactly the length of all the rest. How many shops and mills throughout the country can we go into where saws are used and not hear that confoundedly annoying sound, gig-gig-gig of saws that are running out of round. This comes from two causes, one of which is the hole in the saw is a little to large, and the saw is put on regardless of this fact, and if a saw be ever so round, if put on the arbor this way, it is impossible to cut both sides alike, for it becomes an eccentric just as soon as put on and, pitiful to relate, always remains so. Very many, it is true, have a mark and always put it on in the same place with the marked side up, but this only half remedies the fault, for it will crowd one way or the other and is never exactly round. There is only one way to remedy this fault, and that is, by some means make the saw fit the arbor nicely. The other course is the common one. Saws are run week in and week out and are never trued, and a saw should be faced or trued up once a day if it is doing anything at all. Keep a nice piece of common grindstone and hold it up to the saw till it just touches, and then pass it carefully across the face of the saw till every tooth is hit. Now take off and file up nicely till the points come up to a fine edge without turning a burr if possible Don't file and file till a burr is turned up like the fingers of a Hindoo devotee, because if you do the saw is out of shape again and needs truing up as much as it did before you touched it. A little care and the light falling on the point of the tooth so you can see what you are about, will give you a habit of filling just enough and no more.—*Cabinetmaking and Upholstery.*

CEDAR.

It occurs to us that if red cedar was properly introduced in this market, and its merits once thoroughly known to the consumer, it would become a very important factor in the lumber interest of the city. It is a matter worthy of comment that red cedar fence posts and red cedar dimension is in less demand in this market than in any other of the country; and this, too, in the very face of the fact, of all timber that grows, there is none possessing such lasting, such imperishable properties, if you please, as red cedar for fence posts. We recognize the fact that it cannot be secured in this market, so as to be sold to the consumer at anything like the prices for which white cedar is offered, but we see no economy in paying 15 cents for a white cedar post that will last but five yeers when for 30 cents a red cedar one can be had that will last a generation of years We were not a little surprised to know that some time since a couple of Tennessee gentlemen shipped a carload of red cedar posts to this city, and came in person to dispose of them and, if possible, lay a foundation for the future trade, but their experiment resulted in a deplorable failure, not only to receive a consideration for them that justified them in bringing them to this market, but in making any arrangement for future trade.

We cannot understand why it is that a wood possessing such valuable merits, not only for posts, but for the building of clothes closets in dwellings, is so little in demand. Where cedar is used in interior work vermin and moth will be unknown; and it is susceptible of beautiful finish that adds to its value as a wood for house building purposes.—*Lumber Trade Journal.*

TIGHT BELTS.

A large quantity of belts is required to transmit a little power. The sooner we investigate and believe the above fact, the better it will be for our shafting, machinery and coal-heap. We may look at the fact as we please, it will bear it, and find that a slow running belt to carry a given power must be very wide. If running at high speed, we must have the same number of square inches of belt passed over the pulley, but the belt need not be as wide to do it.

When a belt slips, the most natural action on the part of the attendant is to throw a handful of powdered rosin between belt and pulley. The next move, when resin fails, is to tighten the belt. Often we find belts strained up until they are tight enough for fiddle strings, until hangers are pulled out of line, boxes cut and shafting sprung.

A certain machine company drive their works by long loose belts which claim attention from their very looseness. These belts are 10″ to 12″ wide, about 16 feet from pulley to pulley, and are slack enough to permit the upper or slack side of the belt to "bag" down 12' or 18', a plone passing through the two shafts being about 45° from the perpendicular.

If this machine company had followed the example of many power users, they would have used belts 5″ or 6″ wide, strained them very tight, and have been continually troubled by the belts breaking and wearing out. The belts above described, ran upon large pulleys (from 24 to 48) having a speed of 250 or 300 revolutions per minute.

Probably these belts would have done one-half more work than was put upon them but from the fact of being loaded light, they did their work with very little wear and tear. They needed very little looking after, save to keep them oiled and cleaned.

At the Novelties Exhibition at Philadelphia, a centrifugal pump was shown raising a very large quantity of water, and being run with a 1½″ belt. Here, high belt-speed was used as a factor, but the little belt was strained very tight. It will soon give out and need constant patching.

When putting up a machine to run by a high-speed belt, don't make the mistake of cutting down the width of the belt too much. Let it go wide enough to transmit the required power without being too tight.

A certain builder of gauge lathes built a lathe to make button-hook handles. The handles were about ⅜″ or ½″ in diameter, and 1½″ long. When the belt was at its highest speed it ran over 4,000 lineal feet per minute, yet the belt was made four inches wide. Just think of it; a round sewing machine belt would almost have done the work, yet here was a four inch belt. The builder of that lathe says he would do the same thing again, for the belt service was complete, there was no slip of belt, no excessive friction, and the lathe spindle always ran true and cool.

When we see a man putting on a 14″ belt with clamps, and using a 24″ monkey-wrench wherewith to screw up the clamp bolts; then we can say to ourselves that this man is doing a poor job.—*American Machinist.*

A TELEGRAM from Washington in regard to the Morrison bill says:—The imports of articles of timber and lumber named in the bill as affected by the proviso as to export duty are imported from Canada, which country as far as learned imposes no export duty on the articles named, therefore the proviso has little or no effect." If pine and spruce are not included in the proposed free list, as Mr. Little believes, then this statement is correct; and it would appear to confirm the impression that Mr. Morrison does not propose to place pine and spruce lumber on the free list. If, however, he wishes the provisions of the bill regarding lumber to be of benefit to anybody those kinds of lumber should be included.

Chips.

It is said that Pack, Woods & Co., Americans, own 600,000,000 feet of timber in Canada.

W. W. Sutherland, Saginaw, handled 4,000,000 feet of hardwood lumber last year.

The Mississippi Valley *Lumberman* does not think there are more than 48,000,000 feet of old logs in sight in the booms or along the Mississippi river.

The latest from the Menominee district in Wisconsin is that the estimated cut of 400,000,000 feet would be realized, over 200,000,000 already being banked.

The steam saw mill owned by Mr. O. Dufresne, situated about four miles from South Durham, Que, was totally consumed by fire on Feb. 19th; fully insured.

A Lumber firm in Ottawa estimates that it will cost $4,000 to make alterations, if the bill providing for the increase in width of tires of heavily laden wagon, passes the Ontario Legislature this session.

Mr. T. H. DeCew has leased the Hanlan mills from the Essex Centre Manufacturing Company, and will go at once into the extensive manufacture of staves.

The N. & A. Barnard Lumber Company have sold to E. R. Phinney, of East Saginaw, 3,800 acres of pine land in town 17-2 west, Gladwin county; consideration $24,000 cash.

Windsor is resolved to have an electric railway, from Ouillette avenue to Walkerville. Capital of the company, $30,000, length of road 1½ mile, rolling stock one motor and one ordinary car.

It is reported that never before were there so many small operators at work in the logging district of the Menominee as this winter. It is probable that the same is true in all the leading districts.

Mr. Schwarts, of the Royal Swedish and Norwegian Consulate, at Quebec, has favored us with a pamphlet on lumber shipments prepared by a gentleman residing at Helsingfors, Finland.

The Victoria, British Columbia, *Colonist* says:—The George E. Star took away the immense plank sent from the Province to the Colonial Exhibition. It is nine feet in width and twenty feet long.

Mr. C. Young, of Young's Point, Ont., has had a new cast and track from Wm. Hamilton's foundry, Peterborough, put in his saw mill, and new saws put in his saw and shingle mill. He closed his mills on January 1st, but was compelled to start work again.

Silas H. Raymond, of Grand Rapids, Mich., has invented and applied for a patent on a machine which he claims will set up a common stave barrel, both ends at once, using four tress hoops, in less than one minute. He says the machine is very simple, needs no power, and can be operated by one boy.

The Muskegon *News* says:—News from the woods is, that notwithstanding no snow in December, to much in January, and soft weather thus far in February, the log cut will be nearly the amount expected, namely 400,000,000 feet. This showing is made possible through the activity of a large number of small operators who have pushed their work with more than usual energy.

NORTH WESTERN ONTARIO.

The *Banner* says a party of young men consisting of T. Brooks, S. Brooks, F. Hogue, whilst cutting shingle bolts near Riley Lake a few days ago, discovered a bear's den inhabited by an old she bear and her two cubs; the boys had no fire arms and were proceeding to demolish the two cubs when old mother bear rushed to the rescue and attempted to give them an affectionate hug, but a few well directed blows with the axes soon put an end to her armorous intentions and settled her prospects for any closer alliance. The whole trio was captured and carried home in triumph.

THE FOSSIL WOOD OF THE WEST.

An interesting paper has been communicated to one of the California scientific societies on the fossil wood which is found in different localities throughout the state.

This silicified wood is stated to be a variety of quartz; the wood fiber is gradually replaced by quartz, leaving the form of the wood intact, so much so that the sections cut and placed under a microscpe show the characteristic grain of the wood, by which the genera may often be determined, and sometimes the species. In what is known as the petrified forest in Colorado, there are stumps of trees several feet in height and some 12 or 15 in diameter, and one stump seemed to be fossilized while in a charred state, and from it fossil charcoal was obtained. Many of the specimens of wood are encrusted with layers of crystalized chalcedony of an opalescent tint, so beautiful that sections have been mounted and worn as jewelry. In Wyoming there have been found sections of trees 20 inches in diameter and several feet in length, like hollow tubes, with the interior surface entirely studded with pure quartz crystals, presenting a most beautiful appearance.—*Scientific American.*

AUSTRALIAN WATTLE FOR TANNING.

The American Consul at Sydney has forwarded to the United States Government a lengthy report on the leading industries of New South Wales, in the course of which, describing the the leather trade of that colony, he says the great bulk of the material used for tanning leather in Australia is obtained from the wattle or mimosa bark, the produce of various species of the acacia. This bark yields a higher percentage of tannin than any other vegetable material in the world, with the single exception of the celebrated taneka bark of New Zealand, a product peculiar to that colony. An interesting feature connected with the mimosa bark is that its percentage of tannin increases after a year or two when the bark is kept in a dry place. The bark is usually gathered in the spring, which begins in New South Wales in the month of September—the colony being south of the Equator, the seasons are of course reversed. The bark is so highly prized for tanning that considerable quantities are exported to England, the annual exports being about 9,000 or 10,000 tons. Occasionally the exports have reached as high as 20,000 tons per annum. The demand for it has been so great that at one time it was thought the trees would disappear altogether. The New South Wales Government, however, has taken very active measures to promote the growth of these trees, and has caused vast numbers of them to be planted all over the colony, and especially on railway reserves. Strong efforts are also being made to encourage planting these trees by private enterprise. There are many varieties of the wattle, some of which have beautiful wavy and graceful feathery foliage. Wattle barks are usually found in commerce in four forms. 1st, in narrow strips about three feet long, pulled off the tree. 2nd, in small pieces 1 in. in length, and about the same in breadth. 3rd, ground bark having the appearance of retted fibre. 4th, powdered bark, forming a very fine powder. The wattle bark forms a hard and heavy tannage when used strong, but when weakened it produces soft and pliable leather. Extracts are now made from the wattle, and they are extensively used by the English tanners.

Horseman, Attenton!

When your horse is galled or cut, or has an ugly sore, bathe twice daily, and apply McGregor & Parke's Carbolic Cerate. It is undoubtedly the finest healing and cleansing for it. Be sure you get McGregor & Parke's. Sold for 25c. per box at John McKee's Drug Store.

LUMBER DRIVERS' CALKS

FOR USE IN STREAM DRIVING.

Made from the Best Refined Tool Steel and Forged. The method used in tempering leaves every one of the same temper rendering them stronger and more durable than any other Calks made Samples and prices free on application to the undersigned.

THE

Orono Cant Dog

Strongest and Lightest in the market. Made of Best Cast Steel by drop forging process. The Handles are made of best quality straight grained split and turned Rock Maple, 5 to 6 feet in length, bored specially to suit the pick. Prices on application.

Market Reports.

TORONTO.

From Our Own Correspondent.

MARCH 9.—Building operations have now commenced to open out and the yards may expect a good trade shortly, as all differences with the carpenters, plasters and bricklayers, will be amaciably arranged before work is fairly started, so that the difficulties encountered last spring by master workmen will this season be avoided.

A large quantity of lumber is now entering our city, but nearly all of inferior grades, and the same may be said of the larger portion now piled in the railroad yards. Good lumber fit for immediate factory use meets with ready sale at fair prices, and it may with a certainty be predicted that before the first day of June next there will be a great out cry for dry lumber and the cry will be in vain, no dry stuff fit for dressing purposes will be held in stock by that time. The large stock now just sold at Gravenhurst will find its way by rail to Boston, and any dry lots to be had will soon be bought up for shipment to the other side, so that our manufacturers will wake up and find, to their astonishment, that there is not enough dry lumber left for their requirements until the new cut is in a fit state for use.

The present season's cut will be a large one without a doubt, so that no famine need be feared. The difficulty to be anticipated is getting in a fit state for use by the time it will be needed, as it has been found that lumber placed in dry kilns, while perfectly green does not come out in good shape for use.

The demand for shingles and lath is not brisk, but will mend as soon as the season fairly opens, and now that the G. T. R. R. Co. and the N. & N. W. Co. have brought their rates to the same figures, western shipments from the latter road will commence once more. Had this taken place sooner a large portion of the shingles now in stock would have been shipped out some time since, however, better late than never.

Prices at the yards have not as yet advanced on bill stuff in proportion to the advance demanded on car lots, so that it may be fairly assumed that retail dealers are selling at a less profit than formerly. Competition is intensely keen in all the branches, manufactured as well as in the unmanufactured state.

CHICAGO.

AT THE YARDS.

The *Northwestern Lumberman* of March 6th says:—The increase of movement, so plainly seen last week, has almost swelled to a full spring trade since then. Though there has been a slight snow storm this week, and a moderately low temperature part of the time, there have been several sunny days, so that weather conditions, on the whole, have been favorable to shipment. Long trains are now to be seen on the yard tracks, and great activity is manifest. One going about the district now-a-days is led to mentally inquire if is really a fact, as some assert, that the Chicago white pine trade is losing ground from year to year. If such is the truth, appearances are deceiving. It is seldom that the volume of tradé expands to its present proportions so early in March. It may be that the Chicago trade is making its last rallying effort before yielding to the grim messenger. But it is more than likely that it will make several dying efforts hereafter which shall be such displays of tenacious life as will be very disappointing to outside rivals.

A healthy feature of the present revival of trade is that it has come naturally, and without any extra endeavor on the part of the dealers. Travelling salesmen were sent out late, and many houses have not yet put men on the road. It is true that some solicitation by mail was employed, but there was little done in the way of offering concessions in price. Several houses are now letting their customers weight or go elsewhere rather than cut prices. The determination all along the line of yards is to stand firm for values, even if the country trade does not readily respond. In view of this attitude the rapid rise of demand, and the large volume of shipment now witnessed, is an encouraging feature of spring business. It is an indication of the truth of what has, since last fall, been pointed out by the *Lumberman*, namely, that stocks in the country were low, and that when trade did start up in the spring it would manifest unusual strength. No doubt the knowledge that prices certainly cannot go lower, while in some instances they are already higher than last fall, with a tendency to advance, is inducing large handlers in the interior to put in stocks early.

The weather in Kansas, Missouri, southern Nebraska and further southwest, is now sufficiently warm to permit of the use of lumber in housebuilding, and the promiseof great activity in this line is bright. The certainty of a large amount of railroad construction this season in Kansas and Nebraska makes it plain that there will be much improvement in these states, and a large consumption of lumber. For this reason dealers are putting in stocks for the expected demand.

Yet the trade now prevailing is by no means dependent on the trans-Missouri and southwestern requirement. Orders are coming in from all directions. The eastern trade is fairly good. Lumber is being shipped to new points. As was said last week the reach of the Chicago trade is lengthening, as a result of the extension of railway systems centreing here. Larger orders are being placed in eastern and southern cities, as a result of their thrift and growth. It looks as if another period of prosperity would swell the volume of trade at this point to proportions never before witnessed.

It was previously stated that prices of piece stuff averaged about a $11 a thousand, excepting for long joists, which sold for higher and special prices. It is safe to say now that $11 50 is the ruling price on 2x4, 4x4, and short 2x12. Stuff 2x6 and 2x10 of ordinary lengths sells for $10.50 to $11. Long joists sell for higher prices than any named, 2x12 or 14 and 3x12 or 14 range upward almost indefinitely, according to length and difficulty of securing the lumber. Pieces 4x4-20 and 2x4-20 are scarce and in demand, in common with all other 20-foot lumber. No. 2 boards are wanted in excess of dry stock in pile. Assortments of nearly all kinds of lumber that is dry enough to ship are becoming seriously broken, so that if there is no check in shipments during the month there will be a lively hunting around for specialties before the first of April.

Holders of thick lumber report a good inquiry for it, and firmness of prices. Two-inch stuff is the scarcer, and consequently most urgently wanted. There is considerable inquiry from the factories, and it is expected that thicks and clears will be in good demand throughout the season.

The grade called variously shop common, shop stock, cut-ups, and C select, is growing in favor. Some dealers want it added to the list. It is made by picking out from selects, common or culls, inch or thick pieces that are mostly clear, but are marred by slight shakes, rotten spots or knots. Such lumber can be cut up to advantage in shop or factory work with but little waste. It is a grade made much at Ohio points and in the East. An interesting disquistion is made on it in the article appearing in the *Lumberman* on "Dry Uppers." It is probable that it is more successfully made in the yards of this city than anywhere else, because it is only done to make a profitable use of lumber that would do no good to ordinary grades and does not injure them when selected out. The shop common grade sells here at about $20 a thousand Lumber from Wisconsin that is mainly wide and clear, is said to contain a considerable portion of stuff that can be best devoted to the shop common grade. This is on account of the fact that north Wisconsin pine has large knots in it, but wide apart, with clear intervening wood. Wolf river pine has this characteristic, the peculiarity being no serious matter in the factory work at Oshkosh.

The local building requirement is increasing as the season advances. Building permits are daily issued in augmenting numbers. There is no reason to suppose that there will not be as many medium and small buildings erected in the city and suburbs this season as there was last year, and such structures are those that consume lumber. There are also several factory buildings going up, and many business blocks.

Receipts of lumber and shingles for the week ending March 4th, as reported by the Lumberman's Exchange:—

RECEIPTS.

	Lumber.	*Shingles.*

OTTAWA.

From Our Own Correspondent.

FEB. 25.—Since the opening of the Canada Pacific railway to Winnipeg and the Northwest quite a trade in lumber has sprung up, the Chaudiere mills here supplying all orders. The Canadian Pacific Railway Company, in order to encourage this, have settled upon a very reasonable tariff of carrying charges in the matter of lumber, which will undoubtedly be a benefit to both the lumber manufacturer of this portion of Canada and settlers and others in the Northwest, who may require lumber for building or other purposes. Not only has the opening of the road created a new market for the product of the Chaudiere mills, but it has been an incentive to other enterprises, as now many saw mills are spoken of being erected along the line, and close to the timber belt so that prices for lumber may be less and the carrying distance much shortened between the point of supply and demand. This, as it may be expected, has had a cheering effect upon those in the trade, and the future in this direction holds out many bright promises. The great Northwest land must be settled and settlers must have buildings, and where is there a more natural place to look for a supply of material for such purposes than the older provinces, with a great transcontinental line of railway connecting them with an iron band. The Northwest has the land for settlement and the Provinces of Ontario and Quebec the means of making such settlement one of comfort, as far as the necessary supply of lumber is concerned. Men in the trade here say there is no question but in a few years a great and growing trade in lumber with the Northwest will grow up, thus making a fresh marketing field for the enterprise of those engaged in the business. It is easy to contemplate with a certainty that such will grow up as the Northwest territories become more settled. That land must have lumber for building, and the readiest and handiest place to get it will undoubtedly be the Ottawa Valley.

Rumours of sales are reportad every day, the chief buyers being Americans. There is no question but that prices of first-class lumber the coming season will be much in advance of that of last year The indications now point to that as a foregone conclusion.

The export duty on logs, an export duty that will equalize things, is a subject much debated among limit holders and mill owners here. They say that they expect that the Federal Government will give them protection in this matter, and that they will agitate for it until some scheme is inaugurated whereby the lumber industry of this great centre is protected.

MARCH 10.—As the season of spring advances the prospects in the trade grow brighter and brighter. As an indication of what may be expected in the matter sales, it may be told that Messrs. Shepherd, Moose & Co., of Burlington, Vt., have invested to the extent of one hundred and seventy million feet, bought at good figures from a number of lumber manufacturers in this vicinity. In conversation with Mr. John Bromley, the popular manager of the extensive lumber business of W. R. Thistle & Co., he said that he had sold some one hundred thousand feet of samples to an Oswego firm a short time ago, and at good figures. And this was the first purchase this firm had ever made in the Ottawa Valley, and they intimated to him their wish of taking all the lumber which the large mill would cut for the season.

At Hull and the Chaudiere, early as the season is, shipments are going forward briskly, and the C. P. R. have been pressed for cars within the past few days, to take away all the shipppers desire to send. In a letter from E. B. Eddy, reecently received from Europe, where that gentleman is at present travelling, he says the indications point to a good demand from that quarter, and that lumber dealers in Canada need have no fear, but that their stocks of sawn lumber will meet with a rapid sale and a good price.

In the Upper Ottawa region everything is going on rapidly and well, and already there is a demand for men for the spring drives at fairly good wages. In conversation with Mr. Alex. Gordon, of the firm of Booth & Gordon, he stated that lumbermen on the Kippewa and Lake Temiscaminque are pushing things forward at a good rate, and anticipate a good supply of water for the spring drive. Logs, he says, that were stuck on the Kippewa and Gordon Creek last year, will be got out this year. Mr. Gordon is down here to wait upon the Postmaster General to urge the establishment of a post office at the firms depot on the Blanc France River.

LONDON.

The *Timber Trades Journal* of Feb. 27th says:—Messrs. Churchill & Sim, as we fully anticipated, had an excellent room to their sale on Wednesday last; not only were the seats fully occupied, but the tone of the bidding was better; things hung a bit at times, but on the whole better prices were obtained than when Mr. Churchill last held the hammer.

The £15 10s. to £15 15s., which the Archangel deals, ex Sea Gull, fetched could not be complained of; it is true that the shipment was Russianoff's, but even so, we think they were well placed. At any rate, no White Sea Deals this year have touched those figures.

The planks, ex Clematis, we think went rather poorly, being very nice goods and perfectly dry, and at £16 was undoubtedly cheap to the buyer. The deals by this ship at £4 10s. and £4 15s. might also have gone another 10s. higher, and yet been a bargain to the purchaser. Why this shipment was not more favored by the room we cannot quite understand.

The pine parcels were all well treated, and the broads ex Earl King at £30 a standard, was about the best sold lot that we have had to record for a long time; it was not as if they were all wide stuff, many of them being narrows, but the unusual width of 30 in. helped the bidding greatly. The 10 to 15 ft., 8 to 27 in broad, were proportionately well done by at £27 5s., as were the 2nds at £22; in fact, the whole parcel was evidently wanted by those who sustained the bidding. Michigan pine is not—now at least—so well esteemed as Quebec. This special shipment had nothing specially attractive about it, nevertheless it compared favorably with the reshipped Quebec goods subsequently submitted, for which the outside price for 10/16 ft. 3x14 to 16 in. was £24.

The influences operating to give these topping values to bright pine will, as our remarks indicate, be rather strengthened than otherwise, the increasing demand for the wood in the United States and the Dominion itself having a strong tendency in that direction.

LIVERPOOL.

The *Timber Trades Journal* of Feb. 27th says:—There has been a slightly better tone in business during the past week, although the continued severity of the weather retards building operations most materially, and it is to be hoped that this improvement, however slight it may be, is an indication of a return to that improvement in business which has been long expected and so often deferred. We hear that considerable sales of spruce deals have been made for future delivery, not only for this port, but round the coast, though prices are reported to show no advance upon those made during the past season.

Something also has been done in Quebec goods, but not, it is understood, to the extent of previous years. In the meantime, freights are quoted low, owing to the comparatively few orders for tonnage in the market. A large and influential deputation from Manchester waited upon the President ot the Board of Trade on Tuesday last to endeavor to enlist his support to the Bill promotrd by the Manchester Ship Canal Company, authorizing them to pay interest out of capital during the construction of the works. Mr. Mundella replied in a non-committal speech, but the result of the interview is looked upon by those interested as being favorable for the object in view, and sanguine opinions are now being held by many ardent supporters of the scheme that they will succeed in their endeavors, and, these being obtained, one the greatest difficulties they have had to contend with in raising the necessary capital will vanish. Should they succeed in getting the works started, it would be of considerable importance to the timber trade of Liverpool, as not only must a vast quantity of timber be required in the construction of wharves, piers, &c., but, when eventually successful, it will relieve the pressure from the trade here, which is often seriously cramped and hindered from the want of sufficient space in which to carry on a large and cumbrous business.

Rapids progress is now being made with the buildings of the Liverpool International Exhibitions of Travel, Commesce, &c., to be held here during the summer months, and from what we can here it is likely to be a success.

Extensive as are the buildings, the applications for space have been, according to the public statements of the secretaries, five times as greater than the capacity of the floor space will allow. We understand, there will be an interesting exhibition of various kinds of timber imported into this city.

GLASGOW.

The *Timber Trades Journal* of Feb. 27th says:—As will be seen from report of the sale of Quebec timber at Greenock, and cedar at Glasgow, transactions by auction within the past week have been pretty heavy. Arrivals to note since last writing have been unimportant.

In the Glasgow Town Council, last week, there was some conversation with reference to the erection of artizans' or laborers' dwelling-houses upon the vacant ground belonging to the City Improvement Trustees, and it was decided that in the meantime the matter be allowed to remain in abeyance, in consequence of the opinion got from Dr. Marwick, town clerk, to the effect that, although the trustees might agree to erect laborers' and artizans' dwellings as proposed, the parliamentary powers of the trustees did not warrant the contracting of new obligations for such a purpose.

At the annual meeting of the Glasgow Shipowners' Association a few days ago, Mr. Alex. Allen, in moving the adoption of the report, advised against the additions to tonnage being made especially in sailing ships, "until the tonnage afloat is more in proportion to the carrying needs of the world than it is at present."

It has just been brought out in connection with the depression in the shipbuilding trade that, owing to the number of vessels lost, an actual decrease is taking place in the registered tonnage of the country. Tonnage of steamers added last month amounted to 13,708; those removed,14,460; and sailing vessels respectively 8,545 and 17,080, although in the latter case 4,200 tons sold to foreigners have to be taken into account.

These facts point to an improvement in freights.

AUCTION SALES.

On 18th inst., at Greenock, Messrs. Edmiston & Mitchells, brokers:—

			Per c. ft. s.	d.		
Quebec waney boardwood—						
40 logs	44 c. ft. avg.		1	6		
20 "	48 "		1	10½

20 logs	40 "		1	1½		
Quebec 3rd yellow pine deals—						
14 & 15 ft.	7/11×3		1	0		
13 "	7/11×3		0	10¾		
12 "	6/11×3		0	10¾		
9 to 11 "	4/11×3		0	9¾		

On 23rd inst. at Queen's dock, Glasgow, Messrs. Wm. Connal & Co. sold a cargo of Mexican (Minatitlan) mahogany and cedar.

The following priees were obtained for the wood, which was all cleared out, viz., 510 logs mahogany, at 2¾d. to 11¼d. (2 lots at 2½d.), averaging 4 5-32d. Liverpool sale measure; 52 logs cedar, at 2¾d to 4¾d., averaging 3 5-16d.; 2 lots mahogony log ends at 3½d. and 2½d, one lot cedar log ends at 2½d.

There was a numerous company, and demand was good, especially for the larger squares. The cargo consisted chiefly of small logs.

After the above, Messrs. Edmiston & Mitchells offered by auction several parcels of walnut, ash, and birch. Sales were as under:—

Quebec black walnut—	Per c. ft.
22 logs 24½ in. avg. sq.	3s. 9d. to 6s. 1d.
(averaging 5s. 1¼d. per c. ft. string)	
Quebec waney ash—	
49 logs 15½ in. avg. sq.	1s. 5¾d. to 1s. 9d.
Quebec birch—	
18⅜ in. av6. sq.	1s. 8d.

TYNE.

The *Timber Trades Journal* of Feb. 27th says:—The arrivals of the past seven days are a little larger and more varied, but do not amount to much. The regular steamers from Gothenburg and Christiania, have brought their usual complements of pit-props, mining timber, and some manufactured wood. One cargo of Norwegian battens from Krageroe has come forward, and several smaller lots of pit-props will also be found in the list.

The weather remains very wintry, and entirely prevents any outdoor work going forward. Falls of snow have been very heavy, with more or less frost, while in the country districts many roads have scarcely been opened since about Christmas. An immense number of masons, plasterers, laborers, and others dependent upon the building trade, are thus thrown out of employment, and the distress on all sides is most severe.

A little more hopeful tone may be reported as to the prospects of a settlement in the shipbuilding trade, but it does not yet amount to a settlement. Both sides having now slightly modified their demands, it is earnestly to be desired that, at the ensuing meeting, now arranged for, the unfortunate strike will be brought to a conclusion.

It need scarcely be said that the demand for wood goods has not all improved. Work is as slack as it has been at any time for several years, and on all sides the lookout is of the gloomiest description.

MONTREAL.

From Our Own Correspondent.

MARCH 10.—Business in Montreal is moderately active, and distinct improvement can be noted during the past fortnight. The city trade is fairly good and quite a number of substantial country orders are coming in, which keeps up some activity at the yards in making the shipments.

Prices remain firm and payments are satisfactory.

The following are the quotations at the yards:—

Pine, 1st quality, ₱ M	$35 00@40 00
Pine 2nd " "	25 00@30 00

WOOD-WORKING PATENTS.

The following list of patents relating to the wood-working interests, granted by the United States Patent Office, February 23rd, 1886, is specially reported by Franklyn H. Hough, solicitor of American and Foreign patents, 925 F. Street, N. W., Washington, D. C.

336,782—Edger, gang—E. H. Barnes, Brooklyn, N. Y.

336,813—Lathe for turning irregular forms—O Kromer, Sandusky, Ohio.

336,674—Plane—J. A. Traut, New Britain, Conn.

336,697—Saw—G. N. Clemson, Middleton, N. Y.

336,730—Saw—J. J. Parker, Aitkin, Minn.

336,661—Saw hanging—T. W. Peck, Milwaukee, Wis.

336,671—Saw mill head blocks, nose guard for—C. Esplin, Minneapolis, Minn.

336,693—Sawing machine, band—J. J. Bowen, San Francisco, Cal.

PATENTS ISSUED MARCH 2.

336,933—Saw setting and gumming tool—D. McDonough, Eagle River, Wis.

337,083—Saw tooth—W. B. Risdon, Trenton, N. J.

337,103—Saw tooth—C. J. Wilson, Knoxville, Tenn.

THE PROSPECTS FOR THE TRADE

As the lumber industry is of vast importance to the inhabitants of the Ottawa Valley, we have by inquiry in well-informed quarters procured the following information.

Some days ago we published a list of sales, showing that the trade, so far as the manufacturers were concerned, was in a healthy condition, but as a general impression prevailed that these sales were more of a speculative, than of a genuine nature, we decided to investigate the matter for ourselves, with the following result: The American market, although not booming at present, is what a shrewd man would say in a most healthy state, as their stocks are low, and the dealers are confident of a good year's trade; and as the iron trade in the States is much healthier than it has been for some time, it is reasonable to forecast that they are about right. The English market is in much the same position, their stocks are also light, and although trade with them is now rather quiet, yet they too are looking for a good active year, and judging from the manner in which old and experienced dealers are buying up everything in the shape of deals, at sellers' prices it is only reasonable to expect a good trade from that quarter. The news from the South American is far from encouraging, and nothing like what it was at this time last year. The shipments there last year were greatly in excess of the requirements, and with the present unsettled state of the country, and the dread of cholera next season, the outlook in that quarter is, to say the least, very unsatisfactory. In any event neither our lumber kings, nor any of the parties in this section can be affected by a falling off of the trade in any of the above markets, as all of the cut of 1886 in the Ottawa Valley, is sold and in second hands, and at better prices than were ever procured in the previous history of the trade.—*Ottawa Journal.*

SUBSCRIPTION

FOR THE

Canada Lumberman

IT WILL PAY YOU, BECAUSE :

1. It is the only newspaper published in the Dominion of Canada devoted to the lumber and timber industries.
2. It is devoted to the development and utilization of our forest wealth.
3. It furnishes complete and reliable quotations of prices of lumber in all the leading markets.
4. Its columns are filled with interesting reading matter, valuable alike to the land owner, manufacturer or dealer.
5. It costs only $2.00 per year to have it sent, post-paid, to any address in Canada, and no land owner, lumber dealer, manufacturer or individual in any way connected with timber industries, can afford to do without it.

☞TO ADVERTISERS.

It has a circulation among saw mill owners, manufacturers, lumber and timber dealers and all classes connected with the timber business.

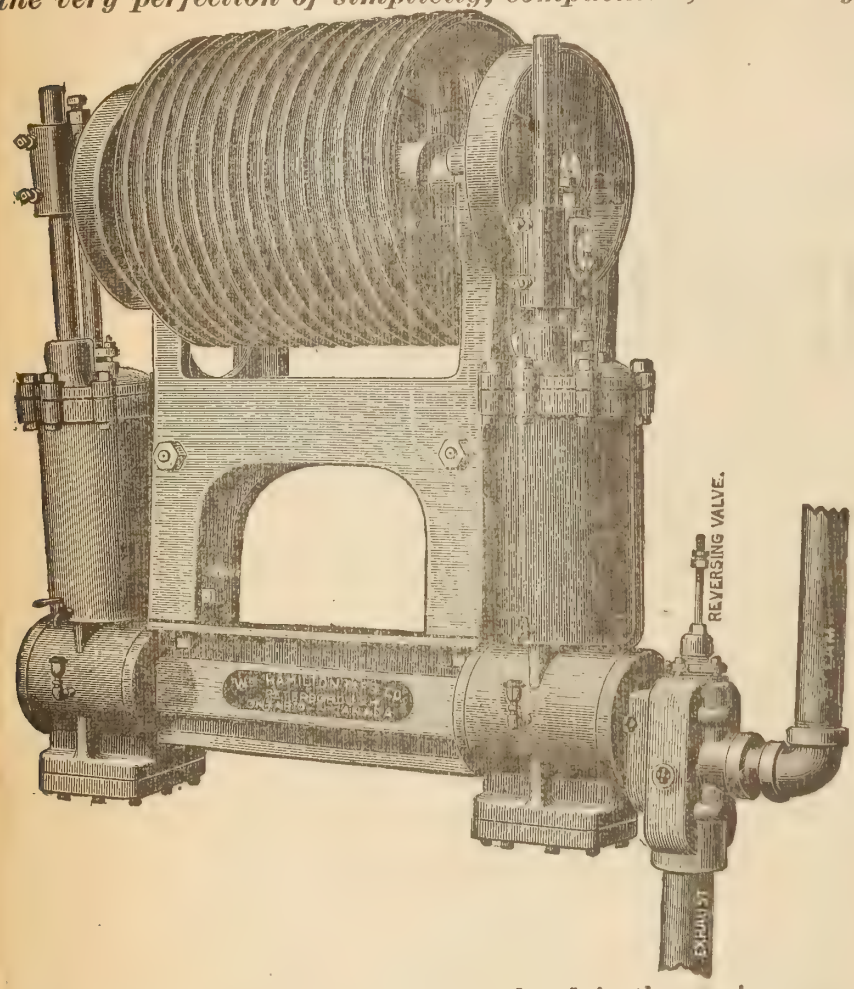
Examine the field, count the cost, and you will at once decide that the CANADA LUMBERMAN is the

——CHEAPEST, BEST, MOST RELIABLE and ONLY TRUE MEDIUM——

for placing your goods or wares before the saw-mill men and lumber and timber dealers of the Dominion.

CUNNINGHAM'S
PATENT OSCILLATING TWIN ENGINE
FOR STEAM FEED IN CIRCULAR MILLS WITH RACK OR ROPE.

This Engine has practically but two moving parts, aside from cranks and shafts. The whole array of eccentrics, valves, valve rods, connecting rods, cross heads, slides, levers, rock shafts, bell cranks, etc., is done away with, and the very perfection of simplicity, compactness, durability and cheapness attained.



The above engraving illustrates the Twin Engine, 10x16, for Rope Feed, for Saw Mill Carriages. The spool is 27 in. diameter, 30 in. face, is grooved 2 in. pitch for 1½ in. rope. The shaft is steel, 4½ in. diameter, with disk cranks. No connecting rods, eccentrics or valve rods to get loose and out of order. The ports are in the trunions, and worked by an oscilliation of the cylinders, and are held in their place in the downward motion by a steam cushion below. The sawyer's valve is a perfect balance, and by moving this valve the engine can be reversed, stopped or started almost instantaneously if necessary, as the sawyer has perfect control of it by his lever either to go fast or slow. Should the sawyer let go of his lever either by mistake or any other cause, it is balanced so that the valve will come to the centre and cut the steam off both cylinders and stop the feed. When standing, the lever is locked or fastended, so that is is impossible for it to start off itself. The engine stands upright below the carriage, and bolted to two upright beams, placed on the mill for the purpose. When a rack is preferred in place of the rope, we put on a steel wheel 30 in. in diameter, and the engine placed high enough to work into the rack on carriage bar, or if the beams come in the way, an idler wheel can be used between engine and rack segs; or, the engine can be placed at a distance and have a shaft from it to the carriage; or it can be placed in the engine room, where it is under the control of the engineer for oiling, thence by shaft and pinion to carriage rack bars. These engines are well adapted for cutting long logs, or where the logs are mixed, the advantage of this feed will be apparent to mill men. When the carriages are used in two or more sections, the couplin and uncoup- ling of each section is quick and simple.

There were two of these feeds working this summer and giving the best of satisfaction, one with rope feed at James Playfair & Co's Mill, Sturgeon Bay, near Waubaushene, and one at the new mill furnished by us to Francis Carswell & Co., at Calabogie Lake, on the Kingston and Pembroke R. R. This mill is working with the Rack and Pinion feed, and drops from fifteen to seventeen stock boards per minute. We have also sent one to the Rathbun Company, Deseronto, to put in to feed their heavy Circular Mills. They will also commend themselves for various other cases, especially for running Elevators, hoisting Engines, and wherever a simple and easily reversible motion is required.

We would also call attention to our Improved Hand Saw-Mill for cutting logs

☞ *We guarantee this to be the best Mill of its kind got up, and would ask any one wanting a good Band Saw-Mill to communicate with us. We would also call the attention of Mill Men to our new IRON GANGS, CIRCULAR MILLS and MILL MACHINERY. For further information, prices, &c., address the Manufacturers,*

VOL. 6. PETERBOROUGH, ONT., APRIL 1, 1886. NO. 7.

NEW BRUNSWICK'S WOOD TROPHY.

The St. John, New Brunswick, *Telegraph* says:—If one may judge by the numerous acclamations of surprise and pleasure from the visitors at Messrs. Howe's ware rooms on Saturday as the wood trophy was nearing completion, it is undoubtedly a success both artistically, and from a more practical commercial point. It will no doubt form the chief feature in the New Brunswick display at the exhibition. Much uncertainty was felt as to the effect of this undertaking, but it is gratifying to note that it has surpassed the most sanguine expectations. A more pleasing combination of nature and art could not be well devised, considering the limited grant and the shortness of the time allowed for completion. It has also been an object in this case to economize space and the largest display has been made in the smallest space possible, endeavoring to combine every natural condition of the wood as well as every artificial application.

The main portion of the trophy embraces all the larger or commercial woods, which are sufficiently abundant to form an important item for trade. These are divided into three sections. The left wing comprises the evegreen or coniferous specimens, including hemlock, red and white pine, black and white spruce, hackmatack, cedar and fir. The central section is made up of the dense woods, such as black and white birch, rock and scarlet maples and beech. The right wing consists of black and white ash, red and grey oak, elm, butternut, basswood and poplar. At the base of each of these fifteen large panels there is a log of the same wood, 20 inches in diameter and three feet one inch in height, while the sides of the panels are formed with saplings or young trees of the same woods, resting upon turned bases and surmounted with carved capitals representing the foliage and fruit or flower of these trees. These again are surmounted by a scroll saw and carved bracket, all of the same wood.

Between the large panels and the logs an inclined case or frame, made of ash, has been placed, and contains thirty small panels showing the smaller woods, and, also, several of the larger kinds, which are not sufficiently abundant for commercial purposes or of sufficient importance for the large panels. All of those embraced in these panels are, however, useful in the arts and for ornamental trees. Many of them are comparatively unknown, and their beauty and utility unappreciated. Some, valuable for economic purposes, are used for tool handles, bobbin stocks and novelty work, and are susceptible of a very high degree of polish. These panels consist of sumach, aspen, poplar, ground or pasture ash, choke cherry, wild red cherry, wild black cherry, witch hazel, red hornbeam and hop hornbeam, thorn-plum, water beech, small or white moosewood and black moosewood, striped maple, white or silver maple, mountain maple or whitewood, black alder, swamp alder, yellow birch burl, gray birch and matted birch, billbury, May cherry, rowan tree or mountain ash, swamp rowan tree, dogwood, slippery elm, white willow, balm of gilead or balsam poplar, wild crab apple and princess pine. Each of the panels is framed with strips showing the back, and the corners are transverse sections showing the end grain. The aim of the whole design is to show the woods in all forms, which will interest practically wood workers; therefore the combination in the large panels shows the slash of the grain, as well as an end section showing the density of the grain. These last named sections or quarters show at the base of the panels, also convey a better idea of the size of the growth of these trees being taken from more fully developed trees.

The cornice which surmounts these panels forms a very pleasing feature in the structure, and is composed chiefly of bark and specimens of each wood in mouldings. Above the central section is placed a poplar board with ebonized letters bearing the words "Woods of New Brunswick." The whole of the top will be surmounted by stuffed specimens of the best game of our forests, which is now being prepared by Mr. J H. Carnell A fine moose head will ornament the centre, with a cariboo head on the right and a red deer head on the left. Foxes, coons, beaver, porcupine, partridges, etc., are to be added. All of the panels, as well as much of the surrounding woodwork, have been highly polished, showing the capabilities of the woods in their different applications in the arts and manufactures.

An important point in the close grained woods, and those free from resinous tendencies, is their adaptability for staining, and, to illustrate this, oblique bars have been stained across the tops, showing the effects of satin wood, cherry, mahogany, walnut, rosewood and ebony.

The foliage, flowers and fruit have been beautifully painted on both large and small panels, by Mr. John C. Miles, A. R. C. A., and the work does him infinite credit, although laboring under numerous disadvantages as to hurried work and obtaining appropriate specimens to work from. This forms the most attractive feature, from an artistic point of view, and will be a very valuable addition in other ways. So near do the pictures approach nature that many have expressed doubts as to their being painted, and thought them the original foliage.

Messrs. Geo. F. Matthew and Geo. U. Hay, of the Natural History Society, of New Brunswick, rendered valuable assistance in the botanical arrangements, etc, while the society kindly loaned the floral specimens. Mr. Jas. E. Wetmore also loaned his large private collection and otherwise assisted with valuable information. Several of the logs for the base were obtained by Mr. Gabriel Merrit, of Moss Glenn, Kings county, showing that some fine timber still exists in the vicinity of this city. Mr. Thos. Crothers, of Upper Gagetown, Queens county, secured the handsome specimens of oak, elm and many of the smaller woods. Mr. Alex. Henderson, furniture manufacturer, of Woodstock, Carleton Co., also obtained some good samples.

Mr. George Draper, an experienced woodsman, of Southampton, York County, contributed many of the small woods. The carved capitals on the upper portion of the columns, or young trees, are the work of Edwin F. Erazer, John Rogerson, Lawrence Barry and Silas Hoyt.

The original idea as well as the design and construction, is due to the establishment of Messrs J. & J. D. Howe, furniture manufacturers of this city. It may not be out of place to mention that the grant, which was made jointly by the Dominion and Local Governments, was only sufficient to cover the cost of collecting material and other expenses incurred. Therefore the work may be considered a donation from Messrs. Howe, who have spared no pains or expense to insure the best results, and have utilized to best talent in every department. The firm express themselves as most gratified at the hearty spirit shown by all interested in endeavoring to make it worthy of the Province. Too much credit cannot be given to Hon. Mr. Blair and the Local Government for the spirited way in which they undertook this work, even before assistance was secured from the Dominion Government.

THE AGE OF FOREST TREES.

Royal Forester Gericke, of Breslau, in a recent treatise on forestry, gives expression to the opinion that the age of a thousand years attributed to German forest trees is fabalous, that it is impossible to prove a higher age than 700 to 800 years for even the so-called historical trees, and that no German tree can reach that age in a sound condition. Trees of so great an age are always hollow and only continue to grow as ruins. In connection with the question of the limit of endurance of our trees, it is evident that it will vary not only with the variety of the wood, but also with the climate and soil. Forester Gericke, through his own investigations as well as through communications received from German, Russian and Austrian schools of forestry on the age of the oldest woods to be found in their collections, arrives at the following conclusions. The highest age which a sound tree can reach is not reached by leaf-bearing trees, but by needle bearing trees. After the highest point is reached, the needle bearing trees decay rapidly, while the leaf-bearing trees continue to vegetate a long time after passing their limit of existence in a sound state. The highest age of trees obtained by actually counting the yearly rings is from 500 to 570 years, and the firs in the Bohemian forests and the pines in Finland and Sweden actually reach that age. The next highest age seems to be reached by the white fir in the Bohemian forests, which shows 429 years. The larch in Bavaria reaches 274 years. Of the leaf-bearing trees the oak appears to endure the longest, and the red oak of Aschaffenburg, the oldest healthy example, counts 410 years. The oldest long-stalked or white oak was only 315 to 320 years old when evidences of internal decay became visible. Notwithstanding this difference in endurance the white oak is much stronger than the red oak. The old red beeches were 226 to 245 years old. The maximum ages of other trees are as follows:—Ash, 170 years, elm 130, birch 160 to 200, red alder 145, common maple 224. The most frequent among the historical trees, the linden, is the most seldom found in the collections. Perhaps this fact may be taken to mean that it is very seldom possible to find a very old and sound linden. The most celebrated of the historical lindens is that in Neustadt, Wurtemberg, the branches of which were so long ago as 1448 propped up by 67 pillars.—*Exchange.*

THE MORRISON TARIFF BILL.

WASHINGTON, March 18.—The Ways and Means Committee resumed consideration of the Morrison Tariff Bill to-day. Mr. Maybury of Detroit offered a substitute clause, changing the phraseology of the provision in the Bill subjecting the wooden articles placed on the free list to an import duty when the country from which they are imported levies an export duty, and his substitute was adopted. It reads:—"Provided that if any export duty is levied upon the above mentioned articles or any of them by any country whence imported, all said articles imported from said countries shall be subject to duty as now provided by law." It was stated that the provision was intended to cause a relaxation of the export duty now levied upon Canadian logs sent into the United States.

A Timber Reserve.

The Quebec Provincial Cabinet have, it is understood, decided to reserve an extensive tract of country to the north of the Province for future timber supply. Forest rangers are to be appointed to watch and guard this domain. Hon. Mr. Joly has been the active agent in securing this from the Government.

ON March 18th Rounds' saw and planing mills, Welland, were burned. O. H. Round's loss is about $4,000; Ed. Round's loss is about $3,000. No insurance.

Chips.

THERE are fourteen steamers on the Lake of the Woods, Man., mostly employed in towing logs for the saw mills.

FROM six to 12 car loads of square timber are daily shipped from the upper Michigan peninsula for Quebec. Each car load contains about 500 cubic feet of timber.

THE kindling wood interest of Williamsport, Pa., is of some importance. One factory runs night and day to keep up with its orders, employing 30 to 40 hands in packing.

IT is estimated by a local authority that there is 1,649,140,000 feet of stand ing pine in Alcona county, Mich., 225,000,000 feet of maple, 140,000,000 feet of hemlock, and 74,000,000 feet of red oak.

A LUMBER section of the Toronto Board of Trade has been organized, with the following executive: J. Donogh (dep. chairman), S. C. Kanady (chairman), W. Kerr, A. K. McIntosh, W. Leak.

MR. FRANK BELL, lately manager of Messrs. Ullyott & Co.'s business at Minden, Ont., was tendered an oyster supper prior to his departure from that village to locate in Fenelon Falls.

THE Rathbun Company has purchased the entire stock of lumber of Boyd, Caldwell & Son, at Wilbur station, on the K. & P. The stock consists of half a million feet of pine, hemlock, ash and other woods.

THREE miles north of Corrunna, Mich., A. B. Steadman cut an elm tree that made 12½ cords of wood. In a branch, 50 feet from the root, a large bone was found embedded, which was supposed to have been that of an extinct species of animal.

WM. DUNLAP, a whisky seller and grocery keeper at Cloquet, Minn., in 1870, exchanged a $14 grocery bill for the larger share of the island in St. Louis river, at that place. He afterward bought the remainder of the island. He has already sold enough real estate on the island to realize $30,000.

IT is reported that the extensive lumber lands in Nicolet county, belonging to the estate of Mr. W. G. Ross, consisting of 30,000 acres in fee simple, were disposed of by the Union Bank a few days ago to a syndicate, composed of Messrs Mitchell, Phee & Church for $95,000 cash.

The Langstaff-Orm Manufacturing Company Paducah, Ky., has in operation a circular saw which is claimed to be the largest in the world in regular use. It is 88 inches in diametes, is given a feed of 15 inches or more each revolution and is said to be able to cut 8,000 feet of lumber in an hour.

IT is stated that the Michigan railroad managers have made arrangements with Secrectary Manning by which loaded platform cars can be sent through Canada on the route to the East, which has been contrary to the customs regulations hitherto. The new rule is hailed with satisfaction by the eastern Michigan lumber shippers.

A LOAD of logs was lately drawn by a span of horses belonging to Messrs. Lord & Hurdman, at Wm. Sourley's shany, on the Magnissippi river, near Deux Rivieres, containing 32 standards and 23 parts and is supposed to be largest load of logs ever hauled by one team on the Upper Ottawa. The load was measured by John O'Connor, culler.

THE Chicago *Times* says:—The Chicago, St. Paul, Minneapolis & Omaha Railway Company recently sold to R. D. Pike, of Bayfield, Wis., for $690,000. Several wealthy pine-owners have been figuring for the tract. It is said that the sale will nsure the building of another mill on the west side of Chequamegon Bay.

MR. MOSES ROBINSON, with an average of 18 men at Pickerel lake during the past five months, has got out and drawn upon the ice 2,250,000 feet of logs, and wants to know who can beat it.—*Burk's Falls Arrow.*

IT is reported that Hall & Buell, of New York, have bought the Patton pine lands on Waiskai river, Chippewa county, upper Michigan. This tract is said to comprise a large proportion of the pine lands that remain unstripped in the vicinity of Sault Ste. Marie.

TWO English exchanges, the *Timber Trades Journal* and *Timber*, arrived at the office of the CANADA LUMBERMAN soaked in the briny water of the Atlantic. They had evidently been on the Oregon, which was mysteriously sunk in the ocean, but the papers were brought to the surface and forwarded to their destination, little the worse for their bath.

COMPARED with Ontario, says the Hamilton *Spectator*, Connecticut land is poor. But a few years ago Connecticut owners of land that were unfit for farming, planted trees upon their farms, and now these places are worth $100 an acre for their timber. There are a good many places in Ontario where timber would be the most profitable crop that could be grown.

WONDERFUL activity is noticeable among the hardwood manufacturing establishments in Maine, New Hampshire and Vermont. The multiplicity of uses to which fine forests of oak, maple, white birch, beech and ash are adapted seems only recently recognized. Dealers in improved wood working machinery are finding some of their best customers among the New England lumber manufacturers.

WOOD intended for paper pulp is shaved so finely by an ingenious machine devised for the purpose that it takes 750 thicknesses to make an inch. The fineness of the cutting can be appreciated when it is understood that 200 thicknesses of ordinary paper make an inch. The cutting knives of the machine are kept sharpened while in operation by a unique arrangement of whetstones which are constantly at work upon them.

MESSRS. Sewell & McElvaney have a hundred men and a proportionate number of horses at work near the Allagash waters, and they will continue to the middle of April. They have already cut about four millions of pine and two millions spruce. The pine is of the finest quality and largest size, some logs measuring six feet across the butt. The spruce is also very good, free from flaws and extremely large. A spruce tree three feet in diameter is now a rarity here, but up in that district not at all uncommon.—*Fredericton Capital.*

GEORGIAN BAY OPERATIONS.

A letter from Midland, Ont., to the *Northwestern Lumberman* says:—As our logging season is about closed I am able to give you an estimate of the result of our winter's operations which will be found very near to the facts. On the Georgian Bay we will manufacture about 203,000,000 feet of lumber, if the logs all come out; at Gravenhurst and vicinity about 74,000,000, with about 1,500,000 cubic feet of square and waney timber for the English market, and about 16,500,000 feet of logs for export to the United States. The cut of white pine will be as follows:—

	Feet.
N. Dyment, Thessalon	3,000,000
Williams & Murray, Mississauga	2,250,000
Various mills on Manateulin island	15,000,000

Parker, Stephenson	1,000,000
Tait & Heath and others. Huntsville	4,500,000
W. Christie, Severn Bridge	5,000,000
Longford Lumber Co., Longford	14,000,000
R. & J. Strickland, Bradford	7,000,000

All the above are on the Georgian Bay, Muskoka, Black river and Severn waters All from Bracebridge to Sandridge are on the line of the Ontario and Pacific Junction railroad, just completed. In additi n the square and waney timber product is as follows:—

	Cubic Feet.
Cook & Bros., Mississauga, Serpent and Spanish rivers	250,000
Benton Bros., Grumbling point	200,000
Ontario Lumber Co., French and Muskoka rivers	200,000
McArthur Bros., French and Muskoka rivers	230,000
F. B. Maxwell, Muskoka	145,000
Isaac Cockburn, "	100,000
Strickland, Black river	190,000
Georgian Bay Lumber Co., Muskoka	210,000

We have had a good winter; everything is haulad and most of the camps are broken up. Some few are cutting and hauling, but there is very little inclination to get more than they started in for last fall, and the whole cut is likely to come out of the creeks, as they are all easily driven. The Ontario & Pacific Junction railway has just been completed, and will open for traffic about June 1st. It runs from Gravenhurst to Lake Nipissing, and connects the Southern with the Canada Pacific road. You will see that some of this year's cut is being manufactured on that line. There are several mills in operation on it now. In addition to the above there will be a large quantity of shingles made. Things are looking better here, and there is very little dry lumber in stock at the mills—not more than half the quantity there was last year at this time—and the cut of new logs does not exceed that of last year very much, and there are very few old logs left over.

Wonderful is the instantaneous effect of West's Pain King in relieving cramps, co ic and all bowel difficulties. Worth its weight in gold and costs but 25 cents Should always be kept in every household. Sold by J. D. Tully druggist

Take Notice

J. J. Turner has Something to Say.

If you want a good AWNING or TENT, send to the manufacturer who makes a business of it. Having had over twenty-five years experience in this business, parties in want of anything in my line are sure of getting satisfaction. Tents of every description in stock and made to order. Also Horse and Waggon Covers, Rick Cloths, Waterproof Clothing, in fact anything and everything from a needle to an anchor.

NOTE THE ADDRESS:

J. J. TURNER, Sail, Tent and Awning Maker, East Pier, Port Hope. d391

BUSINESS MEN

ATTENTION!

WE are now offering Letter Books and Account Books with the very best paper and binding far superior to any others manufactured. Also

Blank Books Made to any Pattern

AT THE VERY LOWEST PRICES.

GRATEFUL—COMFORTING

EPP'S COCOA.

BREAKFAST.

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately flavored beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame."—*Civil Service Gazette.*

Made simply with boiling water or milk. Sold o packets by Grocers, labelled thus:

I CURE FITS!

When I say cure I do not mean merely to stop them for a time and then have them return again. I mean a radical cure. I have made the disease of FITS, EPILEPSY or FALLING SICKNESS a life-long study. I warrant my remedy to cure the worst cases. Because others have failed is no reason for not now receiving a cure. Send at once for a treatise and a Free Bottle of my infallible remedy. Give Express and Post Office. It costs you nothing for a trial, and I will cure you. Address DR. H. G. ROOT,
Branch Office, 37 Yonge St., Toronto.

A BIG OFFER To introduce them, we will **give away** 1,000 Self-operating Washing Machines. If you want one send us your name, P O. and express office at once. **The National Co., 21 Dey st., N.Y.**

CONSUMPTION.

I have a positive remedy for the above disease; by its use thousands of cases of the worst kind and of long standing have been cured. Indeed, so strong is my faith in its efficacy, that I will send TWO BOTTLES FREE, together with a VALUABLE TREATISE on this disease to any sufferer. Give express and P. O. address.

MARKET BLOCK, PETERBOROUGH

FRICTION OF BELTS.

The friction of belts upon pulleys depends upon the extent to which they are tightened, the extent of circumference with which they are in contact, and their breadth. It is commonly believed that the greater diameter of pulley the more surely does the belt cause it to revolve without slipping. Theoretically, however, and we believe practically, says a writer in the *Circle of the Science*, it will be found that, with equal degrees of tightness, equal breadth of belt and equal circumference as to perfection of contact, the friction of a belt on the circumference of a pulley is the same, whatever be its diameter. The only circumference that can effect the constancy of the result, is that belts, not being perfctly flexible, lie more closely to surfaces curved to a large radius than to those of a smaller radius. When a certain amount of power has to be communicated through a belt, the speed at which the belt moves has to be taken into account, because, power being pressure multiplied by velocity, the greater the velocity with which the power is transmitted the less the pressure that has to be communicated at that speed. In this sense, then, it appears that the larger the pulley the less the slip of the belt, because the greater the circumference of the pulley, revolving at a given angular velocity, the greater is the absolute velocity through space, and, therefore, the less the pressure required to communicate a given power. It is found, practically, that a leather belt eight inches wide, embracing half the circumference of a smoothly turned iron pulley, and travelling at the rate of 100 feet per minute, can communicate one horse power. When less than half the circumference of the pulley is embraced the strap must be proportionately wider; and when more than half the circumference is embraced its width might be less. The law according to which the friction of belt increases with an increased arc of contact is of a peculiar character, but may be readily understood by comparing the friction on arcs of different lengths. If a pulley (of any diameter whatever) were prevented from revolving, and a belt passing over part of its circumference were stretched by a certain weight at each end, additions might be made to the weight at one end until the belt began to slip over the pulley. The ratio which the weight so increased might bear to the weight at the other end would measure the amount of friction. For example, in experiments made to test a theortical investigation on the subject, a belt passing over a pulley in contact with 60° of its circumference was stretched by a weight of 10 pounds at each end; one of the weights was increased until it amounted to 16 pounds, when the belt began to slip. The ratio of 16 to 10, or 16 divided by 10, equals 1.6, was then the measure of the friction. When 20 pounds at each end were used to stretch the belt, the one weight was increased to 32 pounds, giving the ratio of 32 divided by 20 equals 1.6, the same as before; and likewise, when five pound were used for stretching, the weight at one end was increased to 8 pounds, giving still the same ratio, 8 divided by 5 equals 1.6.

So far, then, the friction was precisely proportional to the stretching weight, as might have been expected from the ordinarily received doctrine on the subject of friction. On extending the arc of contact to 120°, the ratio was found to be 2.56, or 1.6-2. And, again, on embracing 180°, the ratio was found to be 4.1, or very nearly 1.6-2, the theoretical iuvestigation brought out this result independently, and the following law may, therefore, be taken as established: If for any given arc of contact the one weight bears to the other at the point of slipping a certain ratio for double the arc, the ratio will be squared; for triple the arc, it will be cubed; for four times the arc, it will be raised to the fourth power, and so on. In all cases, however, much depends on the tightness of the belt, the limits to the force with which it is strained being, first, the tensil strength of the belt itself; and, secondly, the amount of pressure that it may be convenient to throw upon the shaft and its bearings. New belts become extended by use, and it is, therefore, frequently necessary to shorten them. Before use they should be strained for some time by weights suspended from them, so as to leave less room for extension while in use. Wherever belts are employed they should be of the greatest breadth and travel at the greatest speed consistent with convenience, as it is most important to have the requisite strength in the form best suited to flexure, and the least possible strain on the shafts and bearings. When ropes or chains are employed, as in cranes, capstans, windlasses or the like, for raising heavy weights or resisting great stains, the requisite amount of friction is obtained by coiling them more than once around the barrel of the apparatus. It is found that one complete coil of rope produces a friction equivalent to nine times the tension on the rope, the barrel being fixed. Two complete coils of the rope produce a friction equivalent to nine multiplied by nine times the tension, and so on. The diameter of the barrel does not effect the result. Having regard to these facts, we may readily understand the force which a knot on a cord or rope resists the slip of the coils of which it consists, for the several parts of the coil act as small barrels, around which the other parts are coiled; and the yielding nature of the material of which the barrels are composed permits the coil to become impressed into their substance on the application of force, and prevents them from slipping more effectually than if they were coiled on a hard and resisting barrel.

THE MATTER OF PRICES.

The statistics show indisputably that prices of all kinds have been steadily sinking for the past four or five years. This decline has been so gradual and so general that it has not attracted as much attention as its importance has warranted and the people are beginning to see in a definite way that the process has method in it, and that the conditions which govern it are of a logical and irresistable character. It is difficult to believe that the general average of prices in this country at the present time is actually 20 per cent less than it was in 1860, and that accordingly the cost of living is one-fifth smaller than the rate which prevailed just before the war; and yet the figures prove such to be the fact beyond question. There it not a single article of ordinary food or clothing which commands as high a price as it did a quarter of a century ago, when we thought things were as cheap as they could possibly be grown or manufactured, and the tendency appears to be towards a still further reduction rather than in the opposite direction.

The situation is due to causes of a permanent kind—to the increased use of machinery, the development of new areas of farm lands, the regular growth and application of capital, and the multiplied facilities of transportation, and of easy and rapid commercial exchange. Our whole system of trade and industry has been revolutionized. We do business according to modes and calculations that were not present, or even dreamed of, twenty-five years ago. The old rules that were once deemed infallible have been trivialized and exploded, and the man who got his education in any pursuit before the war has to requalify himself for successful dealings with the circumstances which now exist. We cannot estimate values any more by certain universal standards. A bushel of wheat is no longer worth a given sum, below which it cannot fall in any event. There is no fixed limit that can be safely counted as to the coming price of pork or beef, regardless of all possible fluctuations. The only certainty in the case is that it is mainly a question of chance, with a probability of lower instead of higher rates than those previously obtained.

We are not differently situated in this respect from the people of other countries. The decline in prices has been general throughout the civilized world. It is an area of cheapness everywhere. The same causes which have steadily lowered the margins in the United States has operated to produce similar results in all other quarters of the globe. We have not constructed all the railroads or employed all the new and improved machinery, or opened up all the increasing areas of cultivation and production. The people of all the other leading nations have been using like energy and enterprise in those directions. We formerly enjoyed a monoply in several brances of trade—as cotton, grain, meat, etc.—but we do not hold it any longer. The markets that we once practically controlled are now filled with competing products, and our right to establish selling rates is disputed at every turn There are new sources of supply being reached and utilized all the time, with an appreciable effect upon the issue of values wherever there is such a thing as commerce; and we may as well open our eyes to the significant truth that a good many advantages which we have heretofore been blessed with have gone never to re turn.

Our position is still a surprising one in some regards and must always continue to be so; but it is evident we have reached a spirit and encountered a measure of competition that must deprive us of the power to dictate terms and regulate prices to suit ourselves. Like all other nations we are subject to those familiar laws and principles which are the basis of every true system of commerce. The rule of supply and demand extends to all sorts of products and all forms of traffic, and there is no way to subvert or avoid it. We cannot sell our surplus grain and stock and minerals at any higher rate than those at which some other country stands ready to furnish them; and when the world gets as much as it needs of a particular product it will not buy any more at any price. These are simple propositions but very forcible ones, and they have just now a peculiarly distinct and very practical bearing upon our affairs. It is folly to ignore or disparage the fact that we are face to face with influences that must shape our commercial relations and adjust our profits in spite of all resistances on our part, and with doctrines that are as old as civilization itself.—*St. Louis Globe-Democrat.*

COMPARATIVE COST OF FRAME AND BRICK BUILDINGS.

A very interesting article is found in the *National Builder*, giving the comparative cost of frame and brick buildings:

The first idea that naturally suggests itself, after the general plan of arrangements has been perfected, is what material shall mainly enter into the construction of a building, brick, stone, or wood? In nearly every portion of the Eastern, Middle and Western States these three building materials can readily be had, and the cost of production does not vary much in any locality. Assuming, therefore, that the first cost is the same in the above localities, we may easily arrive at the ultimate cost of production. For the purposes of this article we may assume the cost of good, common brick during the summer to be eight dollars per thousand; cost of labor and mortar to lay the same in the wall, $4 per thousand, wall measure. The cost of good quarry stone assumed at $10 per cord; cost of labor and mortar to lay the same in the wall, $8 per cord of 100 feet. The cost of framing lumber, $12 per thousand feet; labor and nails to put the same up $6 per thousand. With these prices as a basis, it is a matter of computation only to arrive at the proportionate cost of each material after it has been worked into the walls. As an example, suppose we have ten feet square of plain wall to build, what will be the comparative cost? Ten feet square equals 100 superficial feet. If to be built of brick, 12 inches thick, estimating 22½ brick to the superficial foot, it would take 2,250 brick; cost in wall, per thousand, $12, equals $27. To lay a good rubble stone wall it should be 18 inches thick; therefore 10 feet square, or 100 superficial feet, of stone wall 18 inches thick, at $18 per cord of 100 feet, would cost $27. In estimating a frame or studded wall, there should be included, 1st, the studding, say 2x8—12-inch centres; 2nd, the outside sheathing of 1-inch surfaced boards; 3rd, the siding of clear pine. For this example we have placed the cost of rough lumber at $18 per thousand feet up. We will assume the cost of the inch surfaced boards for sheathing to be $25 per thousand including labor, nails and waste. Ten feet square, or 100 superficial feet, 2x8 studding at $18 per 1,000, equals $2.43. The same surface covered with surfaced boards at $25 per 1,000, costs $2.50. One hundred and twenty-five superficial feet of siding, at $40 per 1,000 would cost $5, allowing one-quarter for lap and waste. Then we find the total cost of the frame wall to be $9.93. Add to this the cost of painting same, one square at $3, we find the cost to be $12.93. Comparatively, therefore we find the cost of 100 superficial feet of wall, built of the three leading building materials of the country, as follows:—

Common brick, $27.
Rubble stone, $27.
Frame, $12 93.

The cost of window and door frames, cornices, etc, may be estimated about the same in either building. In brick and stone buildings we find the additional cost of cut stone window and door sills, water table, etc, but the cost of these adjuncts does not enter into the first cost of the walls, and should rather be estimated on separately, or considered as additional items of cost that may be dispensed with if necessary.

TREE PLANTING.

E. P. Roe, in *Harper's Magazine* for March, 1886, has the following article in regard to transplanting trees:

"As a rule, I have not much sympathy with the effort to set out large trees in hope of obtaining shade more quickly. The trees have to be trimmed up and cut back so greatly that their symmetry is often destroyed. They are also apt to be checked in their growth so seriously by such removal that a slendor sapling, planted at the same time, overtakes and passes them. I prefer a young tree, straight stemmed and healty, and typical of its species or variety. Still, when large trees can be removed in winter with a great ball of frosen earth that insures the preservation of the fibrous roots, much time can be saved It should ever be remembered that prompt rapid growth of the transplanted tree depends on two things—plenty of small fibrous roots, and a fertile soil to receive them. It usually happens that the purchaser employs a local citizen to aid in putting his ground in order. In every rural neighborhood there are smart men; smart is the proper adjective, for they are neither sagacious or trustworthy, and there is ever a dismal hiatus between their promises and performances. Such men lie in wait for new comers, to take advantage of their inexperience and necessary absence. They will assure their confiding employers that they are beyond learning anything new in the planting of trees—which is true, in a sinister sense. They will leave roots exposed to the sun and wind; in brief pay no more attention to them than a baby-farmer would bestow on an infants appetite, and then, when convenient, thrust them into a hole scarcely large enough for a post. They expect to receive their money long before the dishonest character of their work can be discovered. The number of trees which this class of men have dwarfed or killed outright would make a forest. The result of a well meaning yet ignorant man's work might be equally unsatisfactory. Therefore the purchaser of the acre should know how the tree should be planted and see to it himself, or he should by careful inquiry select a man for the task who could bring testimonials from those to whom he had rendered like services in the past.

"The hole destined to receive a shade or fruit tree should be at least three feet in diameter and two feet deep It then should be partially filled with good surface soil, upon which the tree should stand, so that its roots could extend naturally, according to their original growth. Good fine loam should be sifted or sprinkled through and over them, and they should not be permitted to come in contact with decaying matter or coarse, unfermented manure. The tree should be set as deeply in the soil as it stood when first taken up. As the earth is thrown gently through and over the roots it should be packed lightly against them with the foot, and water, should the season be rather dry and warm, poured in from time to time to settle the fine soil about them. The surface should be leveled at last with a slight dip towards the tree, so that spring and summer rains may be retained directly about the roots. Then a mulch of coarse manure is helpful, for it keeps the surface moist, and its richness will reach the roots gradually in a diluted form. A mulch of straw, leaves, or of coarse hay, is better than none at all. After being planted three stout stakes should be inserted firmly in the ground at the three points of a triangle, the

tree being its centre. Then by a rope of straw or some soft material the tree should be braced firmly between the protecting stakes, and thus it is being kept from being whipped around by the wind. Should periods of drought ensue during the growing season it would be well to rake the mulch one side, and saturate the ground around the young tree with an abundance of water, and the mulch afterwards spread as before. Such watering is often essential, and it should be thorough."

EXPANSION OF LUMBER BY MOISTURE.

The supreme difficulty encountered by all manufacturers of wooden wares, materials, buildings and articles of every kind results from the shrinking and swelling—or, to put it more elegantly, the contraction and expansion—of wood when exposed to alternations of dry and moist situations. It may be asserted as a fact that no process of seasoning and no condition of dryness will render any wood unchangeable under varying conditions or moisture and dryness. The nearest approach probably that can be made to it is the oven-baked process for the closest grained of the hardwoods, such as ebony, ligumvitæ, boxwood, mahogany, etc., used by the instrument makers. Still, a general precaution, born of long experience, is observed by those who own them. In this connection there is a question that has never been settled in the public mind, and that is, does dry or seasoned lumber "stretch," or expand lengthwise when exposed to dampness, and "draw up" or contract in length after drying? Most people labor under the belief that lumber or timber is not effected endwise, or with the grain, by moisture and dryness, but such is not the fact. The expansion and contraction in the direction of the grain is not nearly so much as in a transverse direction, but is quite perceptible, and is common in a greater or lesser degree to all woods. A gate in the centre of a line of plank fencing that has an inch or more space between the posts will often be found difficult to open in wet weather. A long line of fencing put up with green lumber will often pull apart in one or more places in seasoning, more especially if the line of fencing crosses a knoll or sharp elevation. But the strangest phenomenon connected with the expansion and contraction of lumber is the withdrawal of a nail driven up to the head into two different pieces of wood. For instance, where white oak fencing plank are nailed to cedar posts, the nails will in time be drawn entirely out and fall to the ground. Unpainted poplar siding nailed to green oak studs will not loosen the nails. The acid in the oak rusts the nail so as to fix it immediately but will rot the poplar around the nail until the plank can be pulled off over the heads of the nails. No process of drying lumber will entirely prevent the expansion and contraction of lumber in any direction, but that which has been thoroughly air-dried and exposed for a long time to varying conditions of moisture and dryness will possess the minimum defect in this regard. —*Exchange.*

THE OAK.

The oak has not inaptly been called, says *Popular Science News*, the "king of the forest." The size and age to which it attains are noteworthy. Humboldt mentions an oak, near Berlin, which measured nearly ninety feet in circumference near the base. A tree in the same neighborhood was blown down in 1857 which measured 66 feet in circumference. Their ages have been estimated at from 1,000 to 2,000 years. Gilpin, in his "Forest Scenery," mentions a few old oaks. Of the most venerable of these monarchs is one in Norfolk, reputed to be the "Old Oak," during the reign of William the Conqueror, said to be 1,500 years old, a plate attached to the tree bearing the inscription: "This oak in circumference at the extremity of the roots is 70 feet; in the middle, 40 feet." This was in 1820. The "King's Oak," in Windsor forest, is represented as having been a favorite tree of William the Conqueror, and the largest in the forest, and is being reputed as being upwards of 1,000 years old, measuring, some twenty years ago, 26 feet in circumference at three feet from the ground. An oak in Dummington park ran up fifty feet before a limb appeared, the base squaring five feet. An oak in Holt forest, in Hampshire, measured, in 1859, thirty-four feet in circumference seven feet from the ground. An oak felled in Norbury, as stated by Dr. Platt, was of the enormous size of forty-five feet in circumference; so that when it was lying upon the ground, two men mounted upon horses, on opposite sides, were concealed from the view of each other. He also mentions an oak in Keicot, beneath whose branches it was estimated that 4,274 men could have stood. The largest sum ever realized from the sale of one tree was that of the Geronas oak, a few miles from Newport, Monmouthshire, felled in 1810. According to the *Gentleman's Magazine* for 1817, it was sold standing for 100 guineas, under the belief that it was unsound, and was resold for £405, and subsquently was sold again for £675, and was found to contain 2,426 cubic feet of timber. Its bark was estimated to weigh six tons The Wadsworth oak in Genessee, N. Y., near the river Genessee, was a giant of the forest. It grew in one of the most fertile valleys of the Middle States. Its trunk measured thirty-six feet in circumference, and the tree was a marvel to all who saw it. In Flushing, L. I., formerly grew a rare specimen of the oak. It measured a little short of thirty feet in circumference

The oak is acknowledged to be the most picturesque of trees. As a shade tree it cannot be excelled. Of the oak family there have been numerated by botanists more than one hundred and thirty species. Michaux the elder described twenty and Michaux the younger twenty-six species of North America; and Nuttall thirty-two. Emerson found twelve species growing in considerable numbers in Massachusetts. De-Condolle in his "Prodromus" described 281 species of the oak. The first to be named for planting is the white oak. This tree needs but little description as it is well known. Emerson said of the white oak that it is beautiful in every stage of growth, and is therefore a most desirable ornamental tree, and concludes with these words:—"Let every one who has an opportunity to do so plant a white oak." He measured one of the species in Bolton that was nineteen feet in circumference just above the surface of the ground, and one in Greenfield that was 17½ feet in circumference. The soil suited to their growth is a strong tenacious loam. There is ample room in the oak family to suit the most fastidious taste.

WOOD AS A BEVERAGE.

A sign in a Third avenue grocery window in New York City, read: "Pure Russet Cider, 4c. a Quart."

"That cider was never moved by a breath of country air," said a a man who was passing the window, "and it was never any nearer an apple than it is now as it stands in the barrel in the rear of the grocery."

"Made of sulphuric acid, then," suggested a companion.

"No; that's too expensive."

"What is it made of?"

"Sawdust. I work in a shop where it's made. Pure apple cider is worth thirty cents a gallon. Sawdust cider costs about one-fourth of that We take the sawdust from a couple of wood yards—hemlock, hickory, maple—every kind, just as it comes. We dump it into a big retort and heat with a coal fire. Just forty-seven per cent. of which boils over is crude vinegar. It has to be purified a bit and boiled down a little, but it is pretty good vinegar. When the wood reaches a certain point in the heating process it becomes charcoal, and is cooled off and sold to filter makers. We can beat the grangers on the vinegar business and not half try."—*N. Y. Tribune.*

VALUE OF A TREE.

A German railway which is building an extension at Niederlahustein has just paid six hundred dollars for one cherry tree. The owner asked nine hundred dollars for it and proved that it crops sold for sums equivalent to the interest on that amount. This is really the true way to estimate the value of a fruit tree. The value of a business or a house is usually estimated by regarding the annual income derived from it as interest on the capital and there is no reason why the value of an orchard should not be estimated in the same way.

No doubt this tree was exceptionally fruitful, but if any Canadian farmer will estimate the average annual crop obtained from one of the best fruit trees in his orchard, ascertain its market price and then calculate how large a sum of money must be put out at interest in order to secure as large an income, he will be surprised at the result. Suppose the rate of interest to be five per cent., then a tree whose average annual crop sells for ten dollars is worth two hundred dollars. If the rate of interest be four per cent. the value of the tree is two hundred and fifty dollars. Of course in making calculations a certain allowance must be made for the aging of the tree. A tree may have a certain value apart from its crop as timber, and it is important to know how long it may be expected to bear fruit and what its value as timber will be after it is cut down. Certain kinds of wood are very costly, and trees that do not bear fruit at all often command very high prices. Unfortunately the profit from trees of this class usually falls to speculators or middlemen instead of to producers. There are men who make a business of inspecting logs and buying up the valuable ones, often paying a mere trifle for what they are sure of selling for a small fortune. A good walnut log is sometimes sold at a very high figure. It would pay the farmers of Canada to make a thorough study of tree culture, the best methods of packing fruit and the value of various kinds of wood. If farmers realized the real value of trees of all kinds they would treat them tenderly and with care and would view with horror their indiscriminate cutting. They would take care to replace the large trees that they cut down either for use or for sale, by young shoots that would grow into valuable trees.

Aside from the direct income to be derived from an orchard or a plantation of walnut or other high priced trees, if the farmers in general devoted more attention to tree culture they would all be directly benefitted. It has been demonstrated by experience both in Europe and America that after a country is denuded of its trees seasons of prolonged drought and annual spring floods are certain to follow. Some districts of Europe formerly renowned for their fertility are now desert wastes, owing to the destruction of trees, and in some sections of the United States similar results have already been noticed. The floods on the Ohio and Hudson rivers have only occurred during recent years, and all who have studied the matter unite in saying that they are due to the destruction of the trees. The snow in an open, treeless country melts rapidly instead of gradually, as in a well wooded country.

So far as the value of a tree concerns only the individual the Government is not called upon to interfere, but it is evident that each tree has a general as well as a special value, and it is the duty of the Government to see that this general value is not converted into a source of general loss.

American newspapers are almost unanimous in advocating the free admission of lumber into the United States, and the chief reason they advance for altering the tariff, in this particular, is the fact that the forests of the United States have almost disappeared, and that unless a stop is put to the cutting of trees, floods, drought and famine will inevitably ensue With the abolition of the American duty on lumber there is certain to be a wholesale slaughter of trees in Canada, and the Government should take every precaution to prevent disastrous results.—*Montreal Star.*

THE question has been asked of contemporary whether boards ever shrink lengthwise—that is, with the grain or not. The same journal answers: "The effect of moisture upon the length of boards is the reverse of its effect upon their width. That is, when the board is wet it is shorter than when it is dry."

THE oldest and the largest tree in the world is a chestnut near the foot of Mount Etna, Italy. The circumference of the main trunk is 212 feet.—*N. Y. Times.*

Perhaps the most extraordinary that success has been achieved in modern science has been attained by the Dixon treatment for Catarrh Out of 2,000 patients treated during the past six months, fully ninety per cent. have been cured of this stubborn malady. This is none the less startling when it is remembered that not five per cent. of the patients presenting themselves to the regular practitioner are benefitted, while the patent medicines and other advertised cures never record a cure at all. Starting with the claim now generally believed by the most scientific men that the disease is due to the presence of living parasites in the tissues, Mr. Dixon at once adapted his cure to their extermination; this accomplished the Catarrh is practically cured, and the permanency is unquestioned, as cures effected by him four years ago are cures still. No one else has ever attempted to cure Catarrh in this manner, and no other treatment has ever cured Catarrh. The application of the remedy is simple and can be done at home, and the present season of the year is the most favorable for a speedy and permanent cure, the majority of cases being cured at one treatment. Sufferers should correspond with Messrs. A. H. DIXON & SON, 305 King street west, Toronto, Canada, and enclose a stamp for their treatise on Catarrh.—*Montreal Star* 1y22.

Cards not occupying more than 12 lines (1 inch) for six months	5 00
Cards not occupying more than 6 lines per annum	5 00
Cards not occupying more than 6 lines, for 6 mo's	3 00

Special rates will be made for page, half page and column advertisements.

Advertisements intended for insertion in any particular issue should reach the office of publication at least four clear days before the day of publication, to insure insertion.

All communications, orders and remittances should be addressed and made payable to THE PETERBOROUGH REVIEW PRINTING AND PUBLISHING COMPANY (LIMITED), Peterborough, Ont.

Communications intended for insertion in the CANADA LUMBERMAN, must be accompanied by the name of the writer, not necessarily for publication, but as a guarantee of good faith. Communications to insure insertion (if accepted) in the following number, should be in the hands of the publishers a week before the date of the next issue.

The CANADA LUMBERMAN is filed at the Offices of MESSRS SAMUEL DEACON & CO., 154 Leadenhall Street, London, England, who also receive advertisements and subscriptions for this paper.

PETERBOROUGH, Ont, APRIL 1, 1886.

FOREST RESERVES.

THE report that the Province of Quebec has determined to establish a large forest reserve to the northward, is, if well founded, an evidence of a great improvement in the management of our forest wealth. We can well believe that to the efforts of Mr. Joly, this wise determination is to be largely attributed, and, if so, he has done a good service to the country in a matter which he has always seemed to have at heart.

In the Province of Quebec there has often been shown a more enlightened appreciation of the very important question of the conservation of our fast diminishing forests, and it is therefore only natural that Quebec should now lead the van in this marked change of policy. The other Provinces would do well to note her proceeding and imitate her action in this respect.

The first great desideratum in our forest economy is that there should be such a setting apart of our timber lands from agricultural lands. Settlement not only should not be encouraged, but should be absolutely prohibited in the section set apart for forest. In Canada with its enormous extent of country there is ample room for such forest reserves without denying to the agriculturist space for his plough. We certainly can afford to set aside a certain portion of our territory for this purpose at least as well as France, Germany, Austro-Hungary or even Russia.

There are in fact large tracts of country that are far better fitted for forest than for agriculture, and these should be determined, set apart and reserved from settlement. This would be no hardship to the farmer, for it is indeed no kindness to him to induce him to clear and break up land that can never give him an adequate return for his labour, while we have fertile soil in abundance for all who wish to till it. Even an exceptionally fertile spot in a forest region is not an advisable locality for a farm since the certainty that it can never become the abode of a populous and flourishing agricultural community, must add to the expenses and diminish the facilities of the isolated farmer, as compared with his position in a good agricultural district. On the other hand the forest would not be exposed to the risks that necessarily follow a sparce agricultural settlement, with its burning of fallows and other dangers from fire.

All the Provinces should consider this matter before it is too late, and should immediately proceed to survey the lands that are adapted to be held in forest, and reserve them apart. This in itself would be a great gain even for the present, and it might facilitate hereafter the adoption of a system of scientific forestry, one of the few things in which Canada lags lamentably behind the rest of the civilized world.

RECIPROCITY.

To the Editor of the Canada Lumberman.

MR. EDITOR,—The more I look forward to reciprocity with the U. S. in lumber the more convinced I am it would eventually lead to a greater curse than a benefit. Many inexperienced persons in lumber would think none but a fool would express himself as such, but the day is drawing near when our home consumption to furnish the little world now getting a start within the bounds of our Dominion will require all the lumber it has got. Let those who are so anxious for reciprocity inquire and get posted up about our lumber resources from any old reliable lumber cruiser, and he will at once be informed that at the rate our forests are slaughtered a very few years will stop the output of it. On the river St. John, N. B., above the Grand Falls, not a stick of spruce was cut for St. John market. It was all large pine timber and pine logs thirty-two years ago; now no pine timber, now and then a pine log, and spruce taking from 8 to 10 trees to make one M feet, and now our cedar forests are getting slaughtered by the wholesale by Americans and manufacturers across the lines to save the duty.

I would ask those who are anxious for reciprocity, to show what we can expect to gain by it if we must lose the export duty. From Lake Superior to Nova Scotia, on the millions of feet of lumber we will be deprived of manufacturing, now growing in our forests, which will be utilized by Americans. It will be far better for the Dominion to not allow one stick to leave the country unmanufactured, and pay all import duties to any country we want to ship to. There are plenty of markets for our manufactured lumber besides Uncle Sam's, which would yield fully as good returns, and reap the benefit of its manufacturing to build up our army of labourers and consumers.

If I understand the object of our N. P. it is to build up and tear down factories, by protecting their interests, and I fail to see the justness to discourage the manufacture of our own staple article which is lumber, and encourage the staple article of foreigners, to manufacture cotton, sugar, etc., etc.

If an export duty is to be put on it will be necessary to know how to frame it, to place our mills on an equal footing with the Americans, to manufacture our forest lumber. For instance one cord of cedar will make 3 M shingles, American import duty would be $1.05, which should be charged on every cord export duty. And 1,000 superficial feet of cedar logs will make 13 M shingles, and the import duty would be $4.55, consequently any less than $4.55 export duty on each and every M feet would be offering Americans a premium to manufacture our lumber.

Very respectfully

Yours,

March, 1886. P. D. BYRAM.

THE TIMBER SUPPLY.

To the Editor of the Canada Lumberman.

SIR,—We are again turning our eyes southward closely scanning the distant horizon for the appearance of any sign indicating the lessening or removal of the duty on lumber.

While we are so engaged it might be well to pause and take a retrospective glance, and learn some lessons from the past. The future may be big with coming events, but prior to their development, and while still shadowy, it were well to make preparations for their advent, and for what will most inevitably follow.

The past twelve years teach us lessons which are necessary to be learned and considered well in their relations both to the present and future. The consequence of pursuing a certain line of action must be taken into consideration, more particularly when the evidence of what resulted from following the same elsewhere are clear, and declare in no ambigious terms, that identical results will assuredly follow, whatever we may think to the contrary. We are not free; nor can we escape, from the punishment awaiting those who will not profit by the experience of others, however much we may delude ourselves with false hopes; nor can we expect posterity to avoid the penalty due to the descendants of the improvident and prodigal.

It is not the writer's intention to weary your readers with a long array of figures, but to place before them, as briefly as possible, a few facts from which they must deduct their own conclusions.

In 1874 the Lumbermen's National Association of the United States presented to Congress a memorial and remonstrance against free trade in lumber. From this document we learn as follows:—

The amount of standing pine and hemlock in the United States was estimated by Col. B. Wait to be 325,000,000,000 feet, with 100,000,000,000 feet in the Dominion of Canada The United States Commissioner of Agriculture in his report for the same year stated: "If for 20 years to come the demand for lumber shall increase in the same ratio to the population as in the past 20, the timber on 10,000,000 acres of land will be needed each year for sawn lumber."

During the same year the amount of lumber cut was estimated to be 12,500,000,000 feet. Coming down the stream of time to 1880, we find the amount to be 18,000,000,000 feet, and, in 1884, according to N. H. Eggleston, Chief of the Forestry Division of the Department of Agriculture, Washington, the cut reached the enormous total of 28,000,000,000 feet.

Assuming for all practical purposes the estimate made by Col. B Wait was about correct, the time is not far distant when the supply shall be exhausted. That such is the case evidence is not wanting. Prof. Sargent, special forest statistician of the United States Census Bureau, estimated in 1882 that there remained but eight years' supply. Mr. Leathers, Grand Rapids, in 1885, gives it as his opinion that there are but five years of lumbering in Michigan. He, however, looks to the south to supply the deficiency. It is needless to quote other authorities; the best of all evidence lies in the fact that enormous sums of money are being paid for pine lands. That the Southern and Pacific States possess an abundance is true, but true in a limited sense. The supply being exhausted in the Northwestern States as well as in the Eastern, in which are centred the principal manufacturies, the amount to be required for them will be an increased consumption which will fall on these two areas. This consumption together with a rapidly growing foreign trade, will speedily deplete the forest treasury.

The unavoidable consequence of denuding the ground of trees will rapidly follow, in fact in many places they are now felt, and measures have been taken to remedy the evil so far as can be done at present.

Admitting the estimate of Col. B. Wait for the Dominion of Canada to be correct, we learn from the memorial, etc., that in 1884 the cut amounted to 1,600,000,000 feet. Ten years later it had reached 2,700,000,000 feet. This means that in about 40 years, provided the cut does not exceed 2,000,000,000 feet each year, our supply will be exhausted. This period of time is about the same as that given by so good an authority as Mr. J. K. Ward. *En passant*, the writer desires to acknowledge his indebtedness to both Mr. Ward and Mr. Little, from whose addresses, &c., he has obtaiued much valuable information.

When we consider that in the list of exports of the products of Canada, next to animals and their produce comes lumber, amounting in 1885 to nearly $21,000,000.00, it behooves us to look well into the source of its supply, and endeavor to get at some ida of the results following an unhealthy development of the trade. Of the 2,700,000,000 feet we export 1,600,000,000 feet, the balance representing home consumption. Have we no faith in the future of Canada that we must hasten to destroy the source of one of the most important, in fact the most important, of her products, exporting to foreign climes that which can scarcely be replaced in a life time, and for the reproduction of which we are making no adequate provision? The fact of our having what to-day seems a superabundance of a comparatively cheap material, is no warrant that the near future will not be in want of that same commodity. Bad as it is for this to be done by ourselves, how much worse to permit aliens to strip us of what is most requisite to the building up of our country. What is a forty year supply in the history of a nation; and that supply based on the assumption that no increase of consumption will take place during that period. The increase already in ten years amounts to 1,000,000,000 and that during the time when lumber was comparatively abundant in the U. S., how much greater will it be now that a scarcity has come? Inroads are being made upon our forests by the painfully expeditious and destructive Americans. Attention has been called to them and hopes are entertained that our Government will place a heavy export duty on logs. Neither the difficulty of collecting, nor the gloomy anticipations of American sympathizers, need be a barrier to the imposition of a prohibitory rate of duty. We shall ere long require every stick for our own consumption.

What is to be done must be done at once. Our country is young and in the natural course of events we may look forward to an increased demand for own wants, with a constantly decreasing supply.

Coming generations have claims upon us which we cannot and must not ignore. Let us leave them a portion of a goodly heritage, from which they will know that, instead of squandering our forest wealth in barbaric splendor, or still worse, barbaric sensuality, we, looking down the long vista of coming years, were mindful of them ere yet they reached this tenestrial scene.

A. SIMPSON.

Toronto, March 20th, 1886.

LUMBER PROSPECTS.

"Lumber prospects are exceedingly good this season, indeed better than they have been for many," said Mr. J. R. Booth this morning. "We have had no good season in the woods, and there has been a great cut made."

"How are the foreign markets?"

"Well, we don't often have both the markets English and American, good at once, but this season both are lively. There is a great deal of speculation is the English market, more than there has been of late years."

"Has much square timber been made?"

"Yes, a good deal, more I think than there will be demand for. The consumption has been steadily dicreasing."

"For what reason?"

"Chiefly owing to the increased facilities for carrying small lumber, and again because the price has not yet been remunerative. The increase use of small lumber has also affected the making of square timber."

"Do you think this decrease favorable or otherwise to the trade?"

"It is doubtedly a benefit to the trade. You see in making square timber only the best trees are used, the inferior being left standing. Then in order to square it there is a great deal of waste left in the woods. When small lumber is cut the best, and inferior trees are taken out together and the logs are brought down, and in cutting at the mills the waste is avoided. I think in the interests of trade it is desirable to discourage the making of square timber, and hope to see the cut altogether done away with." —*Ottawa Free Press.*

A MAN named Carey, employed at Hurdman's shanties on the Mississippi river, Ont., was instantly killed a few days ago by being struck upon the head by a falling tree, his brains being scattered all around.

HARD WOODS.

A steady consumptive demand exists for a variety of our hard woods, and a constant change and substitution is going on in the kind of woods used for certain purposes in building. fitting and furnishing. The demand of cherry is steady and we quote $60 to $75 per thousand, for Nos. 1 and 2 of this kind of wood in this market. A car was sold this week at the high er figure. Walnut is firm and in request, more selling at $95 than at $85 per thousand, dealers tell us. Birch, although plentiful enough in the forest, is not easy to find in the market of the quality and dimensions most called for. There is very little selling at $17.00, buyers pay $18.50 to $20 as a rule. Chestnut is quiet and not much sought after. There is more requiry for buttenut, which we now quote as high as $40 to $50. Basswood is an article in very steady request. Soft elm is higher and rock elm unchanged.

The *Lumberman* had recently the following about the Chicago market: "Stocks on hand in the city yards are large and ample for all immediate requirements. The only exceptions are, perhaps, in whitewood, which is very scarce, in dry walnut culls, and in red oak finishing lumber and quarter-sawed stuff. No one can tell why, but red oak actually seems to be more popular than white oak for inside finish, and often commands a higher price."—*Monetary Times.*

THE CAUSE OF DISCOUNTS.

First and last a great many articles have been written setting forth the demoralizing influence upon trade of the practice of making discounts. In this matter, as well as in all others, we find two sides to the question, and both present objectionable features. The habit of perpetually kicking prevails to a greater or less degree in every business house in the country. There are many firms who have a reputation as kickers, that acquire such a distinction entirely through the acts of employes, and while morally responsible are not personally dishonest. A salesman, inspector, or other employe, may become possessed of the idea that he can advance the interests of his employers if he shuts his eyes to justice and secures an advantage over some person with whom they are dealing, by means, which, to use a mild term, we will designate as sharp. There are plenty of employes whose idea of honor does not extend beyond the confines of the lumber yard in which they work, and who believe that to gain an advantage, just or unjust, is to advance the interests of their employer and that it will be appreciated by him and make their services indispensable.

There are dealers who ship lumber and deal with customers on the principal that every identical one of them intends to cheat on the count of inspection, and to offset that possible result will skin the grades or stretch the tally to the utmost limit. Such a policy does not go unnoticed and the average person will retaliate by adopting the other extreme and the ultimate result is a request for a discount. A shipper undertakes to load a car, and from various causes the job extends over a space of several days. It may be that two or three different persons have taken a hand at the tallying, or even if but one is engaged on that duty, the fact of dropping the work and starting again at odd times is sufficient grounds for asserting that an error could very easily have been made in the count. A car load arrives at its destination and the party who holds an order for its delivery sends a truck and hauls away a load or two to one customer and the balance to his yard. The teamster has taken tally of the loads he hauled away, and one or more tally boys in the yard measure the balance and if it does not hold out to the invoice, a claim for discount is made.

A shipper in measuring pieces which contain a fraction of a foot either throws off or adds on the remainder or adopts the just rule of give and take. The firm receiving the lumber may refuse to add on or divide and of course there is a shortage. The system of tallying by hundreds and placing the score on the side of the car or on a shingle, and in other unbusinesslike ways is frequently the cause for a great many unjust kicks, and the allowance of a great many discounts.

There are salesmen by the score who have occasionally so far forgotten themselves as to sell lumber by sample, taking the standard from a pile shown them in the buyer's yard. If a car load shipped on such an order turns out satisfactory it is the exception, not the rule, and the salesman is largely to blame for the discount which is claimed.

The competition of the last two years has caused certain shippers to elevate the standard of grade made by them beyond the limit of any commonly accepted rules of inspection, and now a great many buyers insist upon making the standard severely rigid, and the manufacturer who ships an honest, straight grade of lumber is frequently obliged to discount because a competitor is giving away some of his lumber as an advertisement to secure orders.

These are but a few of the many methods that are in vogue to secure a discount on shipments, and it will be observed that the blame is not to be cast all on one side. The manufacturer in his greed for orders will practice what is commonly called "stuffing;" the salesman will overrepresent, or accepting a low offer will attempt to get out whole by working in a portion of an inferior grade, the consummer will kick because from a laxity of system he has made a purchase fall short, or from a preconcerted determination to secure a discount he authorizes his employes to cut the measurement for defects, and to make the standard so high that the system verges on robbery.

This combination of affairs produces the inevitable result—discount.—*Northwestern Lumberman.*

LUMBER AND TIMBER.

It is a matter of satisfaction that the prospects of the lumbering trade, as a whole, are good. The demand from the United States is strong. The discussion in the American Congress on the Morrison Tariff Bill, and its passage through committee, are held to be of a hopeful character, though they are far from being a guarantee that the measure will pass. Were it not for conflicting interests continually fighting for supremacy, and the side issues introduced into the discussion, there seems no room to doubt that the duty of two dollars a thousand on lumber would speedily be taken off. The effect of this would be to enhance the value of our lumber products generally, and the lower grades especially. It is these lower grades that are more and more difficult to dispose of, and to the export of many of them the duty is an insuperable obstacle. There seems to be an opinion in lumber circles in the States that the abolition of the duty is only a question of time and contracts are being made in advance, on this assumption.

Our exports of timber and timber products to England are not so satisfactory as a whole. Deals have done well, and are likely to do so still; but heavy timber is very slow and difficult of sale, and prices are not encouraging. A good deal of timber has been held over at Quebec for more than one season. If trade were to revive in England an entirely different aspect would be put upon matters; but that appears far off, even yet.

The lumber and timber trade occupy so prominent a position in our industries as to affect the whole mercantile and financial condition. To a certain entent this is true of every part of Canada; but it is more particularly the case in the whole of the regions watered by the Ottawa, certain portions of the province of Quebec, the whole of the Trent Valley district, and the region north of Lake Simcoe.—*Monetary Times.*

GRAPHITE AS LUBRICATOR.

The following interesting matter relative to the use of Graphite (better known under the name of "black lead") is from Prof. John A. Walker's report in "Mineral Resources of the United States" for the year 1893-84:

"With the introduction of heavier machinery the service demanded of a lubricant has become more and more severe. For much of his work it is found that oil will not answer at all, and for much more it answers only at great expense, hence the uses of greases and the more solid lubricants, such as graphite, mica, soapstone, sulphur, etc. When graphite first began to be as a lubricant, anything which gave a stove-polish luster when rubbed was assumed to be "black lead" and fit for lubricating purposes. Experience soon proved it to give varied results—sometimes very good and sometimes the reverse; in fact, it was not reliable because of a lack of uniformity correct sizing and purity and soon fell into disrepute among practical men, though continuing to be be well spoken of in the books. In 1886, however, systematic experiments were begun in this country with a view to producing a reliable lubricant from graphite, and the final result has been very satisfactory.

"Water-dressed dry foliated American graph ite is a little thin flake of graphite of extraordinary properties. Its superiority as a lubricans has been attested by all recent writers on friction. Its coefficient of friction is very low. Its enduring qualities are several times greater than those of any oil. Unlike either oil or grease, it is not effected by heat, cold, steam, acid, etc., and acts equally well under varying conditions of temperature and moisture.

"Many and carefully conducted experiments in the laboratory with Professor Thurston's testing machine, and experience in shops, have shown that for the highest usefulness the flake must be of a certain size and dressed perfectly pure. Graphite never occurs of the proper size and purity for use. Its natural impurities contain substances fatal to anti-friction purposes. Its proper selection, sizing, and perfecting for lubricating purposes is a matter requiring large skill, much machinery, and great experience. The difference between a perfectly pure graphite and one almost pure, but still totally unfit for lubricating, can not be detected by either sight or touch.

"It is recommended dry for steam and air cylinders, mixed with grease for heavy bearings and mixed with oil for light bearings. On being applied to a bearing, it readily coats the surface with a shiny, unctuous veneer. These surfaces then slide on each other with very little friction On being applied to heated bearings, the graphite soon fills up any inequalities of the bearing surfaces due to cutting, abrasion, etc., making them smooth and even, after which the bearing soon cools down and is equally useful for wood or metal surfaces: in short, in all cases where friction exists. If the bearings are loose enough for the introduction of this thin flake graphite, it will prevent heated bearings, cool those already heated, and reduce friction better than anything else. In all cases where the service required of a lubricant is very severe graphite will be found specially useful, as in mill steps, gears, heavy bearings, bed plates, etc.

"This is the most rapidly growing use of graphite. In 1884 a single company sold 250,000 pounds of it for this purpose, branded as 'lubricating graphite,' and probably as much more not so labeled, which was used for the same purpose."

Cholera Preventative.

In order to withstand Cholera and such like epidemics a perfect purity of blood, and the proper action of the stomach, are required. To insure that end, in the cheapest, most available and complete manner, use McGregor s Speedy Cure for Dyspepsia and Impure Blood. There is no purer, safer or more reliable remedy in existence for Indigestion, Dyspepsia, Costiveness etc. Ask your neighbor or any person who has used it. Sold by John McKee. Trial bottle given free

Health is Wealth

DR. E. C. WEST'S NERVE AND BRAIN TREATMENT, guaranteed specific for Hysteria, Dizziness, Convulsions, Fits, Nervous Neuralgia, Headache, Nervous Prostration caused by the use of alcohol or tobacco, Wakefulness, Mental Depression, Softening of the Brain resulting in Insanity and leading to misery, decay and death, Premature Old Age. One box will cure recent cases. Each box contains one month's treatment. One dollar a box, or six boxes for five dollars; sent by mail prepaid on receipt of price. We guarantee six boxes to cure any case. With each order received by us for six boxes, accompanied with five dollars, we will send the purchaser our written guarantee to refund the money if the treatment does not effect a cure. HARDWOOD LUMBER

MERCHANT

Car Lots sold on Commission, railway switch in to yard and plenty of room for storage. Yard corner of Stachan and Wellington Ave. Office, 9 Victoria St.

Telephone Connection.

FOR SALE

VALUABLE

Timber Limits

AND

50,000 SAW LOGS

ON SEVERN RIVER

The undersigned being desirous of confining their operations to their Lakefield Mills on the Trent waters, offer for sale the following limits:—

Township of Hindou, 70 square miles.
" Oakley, 45 " "
" Redout, 22 " "
— An area of 137 square miles.

These limits are estimated to contain 180 million feet of Logs, well watered, and afford means of short hauling from all points, and quick and cheap driving to Georgian Bay. Are offered for sale together with plant, depots, farms, 1,200 acres deeded lands and 50,000 logs, nearly all of which are on the main river, a large proportion of which are 16 feet long. Apply to

R. & G. Strickland,

3mL LAKEFIELD, ONT.

NOTICE.

SEALED TENDERS, addressed to the undersigned, and endorsed "Tender for Indian Supplies," will be received at this office up to noon on TUESDAY, 20th APRIL, 1886, for the delivery of Indian Supplies during the fiscal year ending 30th June, 1887, consisting of Flour, Bacon, Beef, Groceries, Ammunition, Twine Oxen, Cows, Bulls, Agricultural Implements, Tools, &c. duty paid, at various points in Manitoba and the North West Territories.

Forms of tender, giving full particulars relative to the supplies required, dates of delivery, &c., may be had by applying to the undersigned, or to the Indian Commissioner at Regina, or to the Indian Office, Winnipeg.

Parties may tender for each description of goods (or for any portion of each discription of goods) separately or for all the goods called for in the Schedules.

Each tender must be accompanied by an accepted Cheque in favor of the Superintendent General of Indian Affairs on a Canadian Bank for at least five per cent of the amount of the tenders for Manitoba and the North-West Territories, which will be forfeited if the party tendering declines to enter into a contract when called upon to do so, or if he fails to complete the work contracted for. If the tender be not accepted the cheque will be returned.

Tenderers must make up in the Money columns in the Schedule the total money value of the goods they offer to supply, or their tender will not be entertained.

Each tender must in addition to the signature of the tenderer be signed by two sureties acceptable to to the Department, for the proper performance of the contract.

In all cases where transportation may be only partial by rail, contractors must make proper arrangements for supplies to be forwarded at once from railway stations to their destination in the Government Warehouse at the point of delivery.

The lowest, or any tender, not necessarily accepted.

L. VANKOUGHNET,
Deputy of the Superintendent-General of Indian Affairs.

Department of Indian Affairs.
Ottawa, 3rd March, 1886. 9d5

LAKE MICHIGAN TRADE—AN IMPENDING CHANGE.

That the lumber trade of the Lake Michigan districts is passing toward an important change can be plainly seen. The tendency to transition is especially visible in this city, where a large portion of west Michigan, upper peninsula and Green Bay lumber finds a market. The past two years of general depression and close competition to sell on a weak market has nearly wiped out the profit margin between mill and retail yard, when the lumber has to be handled in a wholesale or jobbing way. This has caused manufacturers here, who have distributed their lumber as wholesale dealers, to conclude that lumber at the mill, or by the cargo, has more profit in it than when run through the yards in the line of assorted stock. Some of the Menominee manufacturers are seeking to place their business on a more profitable basis by reliuquishing their yard trade in this city, piling at the mills and shipping direct to retail yards or consumers. Others contemplate throwing up the grading and finer manipulation of lumber entirely, and substituting therefor the selling in cargo lots, or in any way the call may come to them.

It is the general impression among the wholesale dealers of this city that the carrying on of yards here is so costly that a handling bill cannot be made in the sale of lumber, to say nothing of fair profits. But this cannot be the real reason of the merchants' dissatisfaction, for with the exception of difficulty of obtaining a safe line of insurance, and a late increased rate of insurance, it costs no more to run a yard now than it did five years ago. Indeed it may be asserted that a yard can be conducted more economically now than it was before dock rates weakened as they have done during the past two years, if it were not for insurance.

The fact is that the cause of so much dissatisfaction with the yard trade is the fierce competition between the various manufacturing districts, which has grown worse under the influence of depressed demand, low prices, and the new transportation facilities that have been furnished. By reason of the last named evolution, new fields of production have been made accessible, and new avenues to market have been opened up. It has come to this, that a buyer in Kansas, Nebraska or Iowa, can have a choice of any market along the river from St, Louis to St. Paul, of any mill stock in Wisconsin or the upper peninsula, or he can even go around the lake in lower Michigan, if he likes, and thus steal a march on the Chicago wholesale dealer—all because the railroads and the seller will part the Chicago profit in the middle and divide it between them. Thus the manufacturers are brought to the conclusion that there is no object in trying to distribute their product through yards when it can be sold at a fair profit at the mill, without so much risk and worry as the yard business involves. Besides, an important factor in the new departure is increasing demand in the east for product—a requirement that has recently taken a longer reach westward, and grasped larger handfuls than formerly. In order to get what they want, eastern buyers are offering a little more for lumber than it would bring in this or other western markets. This tends to a stiffening of cargo values compared to prices in the yards. The mill owners along the lake shores have also acquired sufficient capital to hold their lumber for all they can get for it. In other words, the conditions that prevailed a few years ago have been reversed. Whereas once the dealers or factors in lumber held the purse strings and permitted the mill men to go on with their sawing by loaning them money, now the manufacturers are the capitalists of the heavier calibre of the two. This change in circumstances enables the mill owners to more nearly hold the balance of power than formerly, and insist on prices that are not favorable to the wholesale handlers.

Besides, the tendency of the retail dealer and the contractor is to go to the mill for their lumber. Retail handlers are also becoming capitalists, for they have relatively made more money within the past two or three years than the wholesale merchants, for the reason that they have been able to buy at almost their own figures. The handlers of large stocks in a retail way are more than ever inclined to buy of first hands, and thus secure the profit that the wholesale dealer is supposed to make by assorting.

What, then, will be the result of the change in tho lake white pine trade that seems inevitable? Will the wholesale trade of this city, South Chicago, Michigan City, Milwaukee and Racine be wiped out? Probably not; but it will, within a few years, fall below its present proportions. While the white pine that is accessible to lake ports lasts, there will be stocks held in this city and at other points for sale by wholesale. The business of assorting will be maintained, if for no other reason than that retail handlers are constantly running out of sorts that have to be supplied at short notice. But the jobber will also more and more cultivate the retail trade at home as well as throughout the country. The time will come when the holders of stock here will lose their distinctive character of "wholesalers," and will sell in round lots at wholesale prices only as an incident of their business, as do large country retail dealers of merchandise sometimes. But this market will always remain a large repository of assorted stocks, which can be drawn upon as occasion requires, by the trade at large.—*Northwestern Lumberman.*

WARPING OF TIMBER.

W. S. Stevenson writes as follows to the *Timber Trades Journal*:—There is a great amount of popular error associated with the wood of the south as compared with the wood of the north side of the tree, it being held that the centre or pith is nearer to the north, and that the annular layers of wood are thicker on the south, and that they possess various degrees of density, shrinkage, &c. This is put forward as a rule, whereas it is only a rare exception, and, wherever it is pronounced, it is invariably traceable to local and other influences. In forest-grown trees, the heads of which are small and uniform in height, the growth of the tree is upwards, and the branches and foliage form umbrageous heads fairly equal all around. In the sections of such trees the woody fibres are found fairly and evenly disposed, the pith, or medulla, in the centre, and the wood on the north and south sides identical in every way. It follows from this, that, as forest grown trees furnish the bulk of the woods of commerce, the question of north or south side wood has no practical appreciable bearing upon the trade. In trees grown in the open, as in the centre of our fields, the stems will be short, the lateral branches large, and the heads, as a whole, well rounded. The reason of this is that the light which is the life of the trees, is all around them. The sides towards the sun, say the south, may possibly be the most verdant, but as the sun is at a great altitude during the few months of the year it has influence upon vegetation, but no marked action upon the disposition of woody layers on the south or north sides of timber trees. The above close and open-grown trees for the rule of vegetation, and we must look to the exceptions for any details touching the questions advanced by "Zero." Take a wood or plantation occupying a given area of ground, the trees surrounded by others will be of straight and uniform growth, whereas those on the outside fringe or skit will be distorted. Such trees, from being partially shaded from the light, will grow all upon one side, the side to the light. Here they will put out large lateral branches, and form thick layers of wood upon the stems, and develop great roots to correspond with the branches above. Such trees in sections will show annular layers of woody matter, those towards the open side thick, soft and porous, and those towards the shaded side thin, hard and horny. It matters, say, in England, little whether the light or open ground is on the east, west, north or south, for, wherever it is, there we shall find the thick and thin layers of woody matter, irrespective of polar position. To this rule of one-sided growth there is the exception of trees depositing their woody fibres in spiral form; the position of the pith, or medulla, in such trees would be erratic. You might in a section, say three feet from the ground, expect to find it inclining to the shaded side, whereas it might be found directly opposite. It is true you may find exceptions in forest growth, for where trees are grown on a hillside, one stepping above another, the foliage will all be produced on the side of the trees towards the light, and the pith or medulla, be found, where spiral growth does not intervene, inclining to the sides where the vegetation is weakest It would matter but little whether such hills rose towards the east, west, north, or south, the vegetation would all incline to the light. In the far north of Europe the case is somewhat different, there the north and south have distinct influence, the trees being stunted, and only putting out branches towards the south Linæus noted such trees in his travels in Lapland, but was unfamiliar with them in the centre of Sweden. He remarked that the wood on the north sides of the fir trees (Pinus Sylvestris) was so hard, tough, and close grown that the Laplanders made their bows of it, and had recourse to it for purposes where hardwood was required. It is fair to suppose that "Zero," in his experience of wood, will never come across trees so influenced in their growth by the south and the north; but if he does he will find the south sides soft, light and shrinkable, and the north sides hard, heavy and subject to little change by the extraction of the moisture. "Zero's" question is put under the erroneous supposition that all trees are influence in their growth towards the south and north; I therefore find it impossible to fram a clear or fitting answer.

LARGE OR SMALL ENGINES—THE SAFE SIDE.

The natural and commendable desire to be on the "safe side" in making a calculation may be, and often is, carried to an extreme, which leads into a greater error than that which it is sought to avoid. A man is going to put in an engine; he has often heard and read of the wastefulness of too small a motor; and so, to be on the safe side he orders an engine which is correctly proportioned for about four times the load which it will be run under, reasoning that a big horse can drag a little load but a little horse cannot drag a big load. There is this difference between a horse and an engine; that while the big horse might not cost any more to buy or to keep, both the selling price and the cost of running an engine increases with its size, owing not only to the increased friction of the larger engine, but to the fact that in order to keep it from exerting its great power it must be run with low steam, a high grade of expansion, and at a very low speed. The owner finds in consequence that he has paid a number of hundred dollars more than he needed for a machine which is less economical than the smaller and cheaper would have been, in order to be on the "safe side."

It is quite as possible, though not so frequent in occurrence, that the boiler power may be too great as it is too little, and as for the boiler material the government authorities are obliged, in the interests of safety, to restrict the fire sheets to a given thickness.

Many superintendents and managers will, to be on the "safe side," fit their boiler room up with all manner of patent traps and get it where it will almost run itself, or so that anybody can run it, and then to be on the "safe side" of the ledger they put any "thing" in to run it. Any "thing" depends upon the safety automatic machinery to look out for everything—he does not even look after the machinery itself, and when it slips up at some critical moment with more or less damage, who is to blame? Any "thing," the automatic safety appliance, or the man who substituted it for brains, to be on the "safe side."—*Saw Mill Gazette.*

BIG WEEK'S BUSINESS.

It is almost impossible to interview T. W. Hastings, the stirring, pushing, enterprising head worker in the business of Mosher & Fisher, of West Bay City, Mich., without getting some interesting and reliable facts for the ear of the reading public.

"How is business, Mr. Hastings?" said the pencil pusher.

"Business is excellent, if we may judge thereof by our own transactions," retorted Mr. Hastings. "During the week back the transactions of Mosher & Fisher have been on a scale of magnitude. Their sales and purchases have been as follows: 350,000 feet of lumber sold to Ohio parties; 4,500,000 to eastern parties; 1,100,000 to western parties. They have also purchased during the week 16,000,000 feet of logs from Thomas H. McGraw & Co.; 25,000,000 feet of logs from Sibley & Bearinger; these latter were intended for East Saginaw mills, but will be brought to Bay City for conversion into lumber; they also purchased during the week 5,000,000 feet of lumber, and invested a sum appropriating $50,000 in pine lands."

"How much do your sales amount to since the close of navigation," queried the seeker after news.

"At the close of navigation the firm had lumber on hand aggregating 21,000 000 feet.

"They have sold up to date 20,000 000 feet.

"The purchases during the same time amount to 5,000 000 feet.

"Leaving lumber on hand at this date 6,000,000 feet.

"Since January 1st, the log transactions of the firm are as follows: Purchased of Smith Bros., Cheboygan, 3,000,000 feet; of T. H. McGraw, 16,000,000 feet; of Sibley & Bearinger, 25,000,000 feet; they have cut on their own land 10,000,000 feet; and having 5,000,000 left over in the Tittabawassee, it gives them a stock for the next season of 59,000 000 feet.

"The mills of McLean. Son & Co., Malone & Co, Laderach Bros., Miller Bros., and Green & Stevens will do the manufacturing for the firm during the season of 1886."—*Lumberman's Gazette.*

BEARINGS FOR MAIN SAW MILL SHAFTING.

In reply to "W. S. F." the *Timber Trades Journal* says that bearings for saw mill shafting are in the latest and best practice made considerably longer than they used to be, with a very satisfactory result both as regards wear and tear and steadiness in running. If you are remodelling your mill we should recommend you to put in bearings about four times as long as the diameter of your shaft, and by all means have them arranged to pivot so that they can adjust themselves to any deviation in the shaft. This is an important matter, but one very often lost sight of, consequently there is a considerable daily loss through increased friction and wear and tear on the bearings, and more power is consumed in driving. It is astonishing how these important matters are neglected even in these days when people should know better. As an illustration we may say we recently went into a box factory where the power was conveyed by a twisted belt running at 10 ft. centres, and the saw benches were about the same distance off, and almost immediately beneath the main shaft. We need hardly say that, with this arrangement, the loss was large, probably nearly £100 a year from loss of steam, loss of speed on benches through slip on belts, increased wear on belts and bearings, less output from benches and worse work. When we pointed it out the reply was, "Yes, perhaps so; but it has done for us for some years, and I don't think we shall alter now." We had therefore nothing further to say.

MATCHES.

Many people now living can remember the time when there were no matches, and people were obliged to depend upon tinder boxes and similar contrivances when they wished to strike a light. It is possible that the time is not far distant when the matches now so universally used will again go out of use. At least a patent is said to have been granted in Russia for a lucifer match that can be used an indefinite number of times, the wood being impregnated with a special chemical solution. Match making is one of the Canadian industries that has attained a high state of development, and matches have usually been much cheaper in Canada than in the United States, partly because the American Government imposed an excise duty on matches, and every box sold had to have a Government stamp.—*Montreal Star.*

THE tug Nat Stickney has been chartered by the Cheboygan Lumber Company to tow logs from Spanish river, Ont., to Cheboygan, Mich., for the season to come.

LIVERPOOL STOCKS.

We take from the *Timber Trades Journal* the following Comparative Table showing Stock Timber and Deals in Liverpool on Feb. 27th 1885 and 1886, and also the Consumption fo the month of Feb. 1885 and 1886 :—

	Stock, 1885	*Stock, 1886.*	*Consumption 1885.*	*Consumption 1886.*
Quebec Square Pine	256,000 ft.	185,000 ft.	40,000 ft.	58,000 ft.

Chips.

TIES to the number of 20,000 are being got out near Neebing, Ont., Crawford & McDonald having a contract for 10,000.

WILMOT WILSON, of Pickering, Ont, was killed by a falling tree while cutting wood three miles east of Newmarket.

FOREST fires have caused great destruction of timber lately in Sussex county, Va. Considerable cordwood was burned.

AMONG the new firms announced in Quebec is M. Stevenson & Co., lumber, etc.; James Timmony and Walter Stevenson, partners.

IN some parts of Mexico precious woods are so plentiful that the natives build pig styes of rosewood l gs.—*Journal of Commerce.*

A FIRE was started in the woods south of Jamaica, L. I., N. Y., March 7th, by tramps who built a fire to cook. A large lot of timber was destroyed.

A JOURNAL in the interests of carriage builders says hickory axles have advanced 20 per cent. within a year, while good dry wood material is scarce and will naturally increase.

MAINE is one of the states in which great trees grow. A spruce was cut in Caribou, Aroostock county, lately, which at a distance of 105 feet from the ground measured 14 inches in diameter.—*Chicago Tribune.*

RAILWAY men complain of the weight of the passenger cars now built, and show by figures that an engine hauls between five and six pounds of dead weight for every pound of paying passenger weight, reckoned when all the seats are filled.

SOMEBODY has taken the pains to figure out that the United States produces enough lumber each year to load 1,428,581 railroad cars, each carrying 7,000 feet. It is also said that this would make a train 8,500 miles long, or about one-third around the world!

THE Parry Sound Lumber Company, says the *North Star*, have commenced fitting up their steam barge, the Lothair, for the coming season's work. Work on the other vessels of the company to get them ready for sailing by the opening of navigation will be commenced shortly.

A CONTEMPORARY says:—A feminine "Pooh-Bah" has just come to light: She is Miss McBrown, of Chesterville, Ill., and is station agent, baggage mistriss, and telegraph operator for the Midland Railway, at that place. Besides this she runs a lumber yard and a dairy, and holds the enviable position of village belle.

A REVIEW of the season's lumbering operations in Minnesota and Wisconsin shows that the lumber cut has been curtailed to the extent of about 123,500,000 feet, though the demand for lumber is equal to the supply, which covers large stocks left over from last year.—*St. Paul Press.*

IT is said that $15,000 was once paid by Messrs. Broadwood—the famous English piano makers—for three logs of mahogany from the same tree, each fifteen feet long and three feet and two inches square; that is something over $33 per cubic foot. The attraction was the unusual beauty of the "burls," which made it valuable for veneers.—*Wood and Iron.*

A REMARKABLE explosion which occurred in Germany shows the force possessed by dust. A sack of flower falling down stairs, opened and scattered the contents in a cloud through the lower room, where a burning flame set fire to the dust, causing an explosion which lifted a part of the roof of the mill and broke almost all the windows.

A NOTABLE example of the utilization of smoke is afforded in the case of a charcoal furnace at Elk Rapids, Mich. In this furnace, as stated, are manufactured fifty tons of charcoal per day; there are twenty-five charcoal pits, constructed of brick, each pit being filled with 100 cords of hardwood, and then fired. The vast amount of smoke thus produced is made to yield acetate of lime, alcohol, tar and gas.

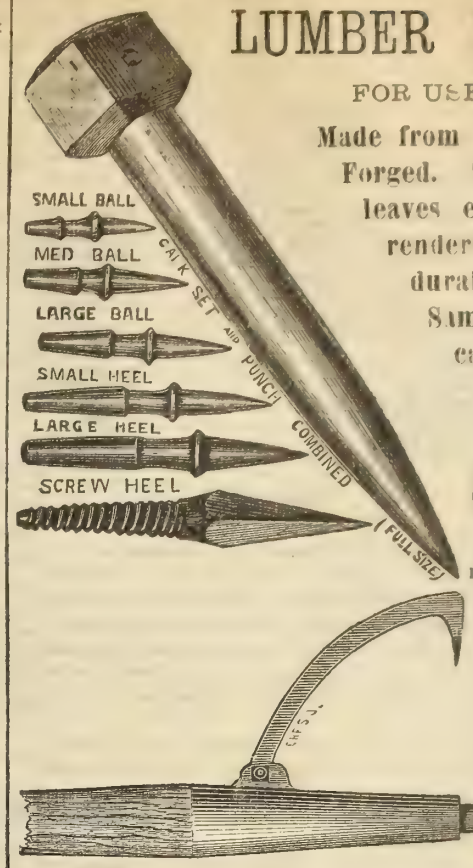
MESSRS. Scott & Scott, an enterprising young firm of lumber dealers in Toronto, have purchased the mill, machinery, plant, &c, together with the timber and limits belonging to the Medonte Lumber Company, near Hillsdale, Ont. The company's contracts for supplying timber, lumber, &c., will be carried out by the new owners. The purchasers have been operating the limits since December last.

As Murney Sills, working in the shingle department of the Deseronto cedar mill, was leaving the mill for his dinner on March 16th, and, while in the act of pulling on his coat, it caught in the driving shaft, pulling him up over it twice and breaking his right arm off about four inches from the shoulder. The unfortunate man was carried to his home, where he had to lie over an hour without a doctor, both physicians being out of town.

Wonderful is the instantaneous effect of West's Pain King in relieving cramps, colic and all bowel difficulties. Worth its weight in gold and costs but 25 cents! Should always be kept in every household. Sold by J. D. Tully druggist

Advice to Mothers.

Mrs. Winslow's Soothing Syrup should always be used when children are cutting teeth. It relieves the little sufferer at once; it produces natural, quiet sleep by relieving the child from pain, and the little cherub awakes as "bright as a button." It is very pleasant to taste. It soothes the child, softens the gums, allays all pain, relieves wind, regulates the bowels, and is the best known remedy for diarrhœa, whether arising from teething or other causes. 25 cent a bottle. Be sure and ask for "Mrs. Winslow's Soothing Syrup," and take no other kind.



LUMBER DRIVERS' CALKS

FOR USE IN STREAM DRIVING.

Made from the Best Refined Tool Steel and Forged. The method used in tempering leaves every one of the same temper rendering them stronger and more durable than any other Calks made Samples and prices free on application to the undersigned.

THE

Orono Cant Dog

Strongest and Lightest in the market. Made of Best Cast Steel by drop forging process. The Handles are made of best quality straight grained split and turned Rock Maple, 5 to 6 feet in length, bored specially to suit the pick. Prices on application.

Market Reports.

TORONTO.

From Our Own Correspondent.

MARCH 24.—All the retailers of lumber here agree that trade is unaccountably dull, and any stranger driving through our city at the present time, and viewing the large number of excavations for buildings now being taken out would come to the conclusion that all the lumber yards were doing a flourishing trade; but a close scrutiny would soon let him in to the secret, and fully explain why our retail men are not doing a brisk trade. Contract work has not yet fairly opened out, and nearly all the building operations that are now being so vigorously pushed forward is chiefly in the hands of speculators, and most of our retail men give them a wide berth, and it remains for the wholesale men to furnish such men by car load. Of course there are exceptions, some of our speculative builders have made their pile, and can command credit from any dealer. This is not the rule, however, wholesale dealers take more chances in this respect than the retail men, and frequently get severely bit for their temerity, as lumber sold in car load lots soon foot up a heavy account, and the lien law as it now stands on our statute books is quite inadequate as a means of protection for any one except a mechanic, consequently our dealers frequently suffer severe losses, and the only effectual way to avoid such losses is to insist that the parties advancing the funds for building shall secure the individuals furnishing materials.

Wholesale dealers are disposing of car load lots readily and prices have weakened on some kinds of stock in consequence of the action of the N. & N. W. R. R. Company in refusing to allow dealers to unload by side of track. The ostensible reason for this course is that the company intend to rearrange their tracks in view of affording more unloading room, which they hold will be needed consequent upon the opening of their extension, north from Gravenhurst to the junction of the C. P. R. R, and dealers have had to push off their stuff at best prices available to avoid demurrage. It is only fair to the railway company to say, however, that they have not pushed their customers at all closely as to time for unloading.

All who are interested are anticipating a good season's trade, and the demand for dry stuff will give the yards plenty to attend to before long, as nearly all the available supply from the mills will soon be forward, so that any one wanting dry lumber will have to go to the yards and get it there.

Some few cases of stocks and 1½ in. plank are still arriving here from Ottawa, but not of a class at all inviting to dealers, being nearly all composed of culls and outs; said outs being mostly thrown out of the clear and picks by reason of shakes. 1½ in. is so hard to obtain, however, at present, that anything that can be worked up will sell at fair figures, and as soon as the new cut is started this class of pine will have to be taken in its green state and put into the dry kilns. Lath are in good demand just now and no large stock of dry to come in. Shingles are plentiful and demand slow, and it is doubtful if the demand will equal that of former years in this city at least, as slate and metallic shingles are largely taking the place of wood and bid fair to come into more general use. There is constant inquiries for 1¼ flooring, and in the rough it is hard to obtain any large supply. All kinds of hardwood are in fair demand. Prices are ruling low, as compared with pine, although the freight is nearly double that of pine, and cost of hauling and cutting nearly double also, yet a good floor of ash or maple can be put down nearly as cheap as one composed of pine, and the day is not far distant when the owners of hardwood lands will come to the conclusion that their timber and time has been literally wasted.

MONTREAL.

From Our Own Correspondent.

MARCH 27.—The activity in business noted in our last report has continued during the past fortnight with regard to city distribution, and a large number of orders have been executed; but the snow storm of last week, and the usual bad state of the roads at the break up of winter, militated somewhat against the country trade.

Business generally compares very favorably with the corresponding period of last year, and some dealers are expecting that their sales during this month will nearly double those of March 1885.

There are no changes in the quotations to note, but the wholesale men are looking for better prices, and this fact seems to have encouraged contractors and others to secure a large portion of their supplies before the anticipated advance takes place.

The following are the quotations at the yards:—

OSWEGO, N.Y.

From Our Own Correspondent.

We cannot change quotations. The movement has been larger than usual since our last report; the better grades of lumber have been more in demand, and dealers having good selections have had a good trade. Stocks are very much broken and all are anxious for the opening of navigation to replenish. Collections are rather slow but prospects are fair for a good trade.

CHICAGO.

AT THE YARDS.

The *Northwestern Lumberman* of March 27th says:—Despite the railroad blockade at St. Louis and southwestern points, caused by the Missouri Pacific strike, the outward movement of lumber during the past week has been heavy. In fact it is doubtful if in any previous March there was more lumber shipped in one week than there has been during the current one. It is also an encouraging feature that the trade this spring is legitimate, not greatly forced, and the lumber is sold at prices within a narrow and positive range—a condition entirely different from that of last season, when prices were soft and yielding, and almost bottomless. Prices are somewhat higher than the highest last year, which gives some chance for profit on last season's purchases, but are yet too low in view of cargo prices for dry lumber.

The strike on the Missouri Pacific lines, and the blockades at St. Louis, Kansas City, Sedalia, and Atchison have been some hindrance to a speedy delivery of lumber on the lines affected, yet this has not checked trade as much as might have been supposed. Orders have continued to come in and cars have been loaded and sent out. The more serious embargo has been at St. Louis, and has been longer continued than at Kansas City. One heavy shipper to Missouri and southern Kansas points jocosely says that if the glut at St. Louis continues much longer the front end of his train will be in Missouri while the rear will be in his yard—thus hyperbolically indicating how heavy his shipments are in spite of the strike.

On Thursday morning the newspapers stated that the switchman's strike at Kansas City was over, and trains were moving on all lines except the Missouri Pacific. This was good news to shippers, and the vividly appreciated because on Wednesday they had been notified by the freight agents that no more lumber would be taken on the Rock Island and Alton roads. If Kansas City can be kept open, Chicago can get along fairly well, as a comparatively small portion of the aggregate of shipments go by way of the Gould lines, though in the segregate the amount is considerable.

It is probable that current shipments have been stimulated by the fear that has prevailed in the West that the railroad troubles would be long-continued, and that they would spread to other systems than those now effected. In fact the yard dealers here have used this motive in their letters and circulars to their customers and travelling salesmen Be sure that the latter have not failed to use the argument upon the retail yard men; and it is a good one it must be confessed. The trouble is not yet over, though it is hoped that the settlement at Kansas City, the vigorous measures being adopted in Missouri, and the cautionary signals being displayed by his highness, General Master Workman Powderly, may be the beginning of the end of the war.

The heavy drain on stocks since the middle of February has seriously broken up assortments that were not too complete in some particulars when trade went into winter quarters. Twelve-inch common boards, 10, 12, 18 and 20, feet long, are very scarce, some yards being out of them entirely. The same is true of some middle river markets, and dealers on the river are now buying boards here in order the eke out small stocks and keep along with their trade. In dimension there is a great scarcity of 2x12, and a considerable lack of 2x4, 2x6, 2x8, 2x10, and all small, and all long timbers and joists. Fencing is also in good demand, and is running low in numerous yards. Some houses have their assortments so broken up that they report having almost too much trade, for the reason that scalping around the district has become a serious matter, as holders are so firm in their views that buying from neighbors is unprofitable. It is expected that the mills will start rather late this season, and there will be little receiving by lake until May 1st. In fact there is no great surplus of dry lumber at the mills that has not been sold. Of course when the lumber was bought last fall or winter by the larger yards begins to arrive, it will ease the pressure for assortments somewhat, but the purchasers will need the bulk of it to keep up their own shipments. It cannot be seen how their is to be much relief to the scarcity of dry sorts throughout the spring if trade is maintained at its present volume. Home consumption is now calling for a large amount of lumber, and this demand will increase until May 1st, anyway. After that the eight hour movement may check building. Just now nobody can tell just how far railroad strikes may spread, and how complete will be the resulting freight embargo. If the labor storm that is prevailing shall increase until it covers the West, the effect would be disastrous to the lumber trade; if it should fair off distribution would continue in heavy volume.

The demand for shingles has been very large this spring, and the houses that make a specialty of carrying a heavy and diversified stock have done a rushing business in this line. Shingles are shipped in every direction. White cedar shingles are making their way into remote regions. One house ships a shaded a A brand, which is sold at 90 cents here, to Colorado, New Mexico, Arizona and California. Such shingles can be laid down in the Rocky mountain regions for $2.10 a thousand.

Redwood lumber from California is attracting attention among the pine dealers. Recent statements in the *Lumberman* about the low prices at which clear redwood can be delivered here has awakened general attention. Cut rail rates from the Pacific coast have brought the matter to the front. A car load of redwood has been received at the yard of Perley, Lowe & Co, Centre avenue and Twenty-second street. Circulars, with price lists, are being received by the dealers. Agents from the Pacific coast are here or on the way for the purpose of working up a trade in redwood. Considerable of this lumber has already been placed this side the mountains, especially at Missouri river points. If the railroads shall encourage this trade from now onward, a large amount of redwood will be distributed within the coming year in the territory tributary to this city.

Receipts of lumber and shingles for the week ending March 25th, as reported by the Lumberman's Exchange:—

LONDON.

The *Timber Trades Journal* of 13th says Messrs. Churchill & Sim were somewhat favored in the matter of attendence, there being a tolerably full room at their sale this week. On Wednesday, especially, most of the benches were occupied, and though the keen north-easter that was blowing keep the passage into Bishopsgate pretty clear, in the sheltered corners members of the trade were noticeable discussing the aspects of the market and the future of prices, those agents who had some yet unplaced stocks to dispose of being on the *qui vive* to buttonhole a country buyer, if any of these somewhat rare visitors just now attracted by the likelihood of getting a little lot or two that would bear the railway charges to this locality happened to be on the spot.

The pitch pine went cheap, only one lot reaching 57s. 6d., really nice logs too, a couple of lots going as low as 50s. Mobile and Apalachicola, however, are not generally so well appreciated as the Pensacola logs. The Quebec waney pine ex Queen of Beauty sold fairly well as things go, but we cannot recollect when £5 has been thought a reasonable figure. The parcel ex Queen of the North went at very low

figures, but the logs were chiefly under 20 feet. If a chivalrous buyer had not come to the rescue, so feeble was the demand that prices would have even faired worse for this description. The lot ex Hispania had to be withdrawn on account of no bidding. The square pine likewise was cheap at the prices obtained. The hardwoods were in better request, though the apparent demand assisted prices but slightly, the bidding lying amongst a few of the leading dealers, these having a limit of their own, which they took care not to exceed.

The Guysborough birch, described as fresh, went wretchedly, but the heavy stock in hand is sufficient of itself to account for the depressed prices, in addition the parcel was not a particularly choice one; nevertheless large dimensioned stuff at 50s. is a rare bargian to those who got hold of it.

The St. John timber was better received, though here again the buyers had it all their own way. The nine pieces of curly at 87s. 6d. read better, but this is a description that is not always come-at-able

The deal portion of the sale began with the Simo planks ex Rosa, which sell at £7 10s., 1st and 2nd yellow deals going at similar prices, and battens 15s. less, fairly good values.

Another of the well sold parcels was Soderham 3rd deals ex Abrota, at £10 10s to £10 15s. The mark O x x H is not the best known out side of London, and accepting them as not representing a leading stock the stagnant state of trade would not warrant much higher. The Skutskar, with which they would about compare, disposed of on the last occasion, went at much the same figures. There was a very large line of battens in this shipment, prices being about at their last level. We noticed 3x8 excited competition when under offer.

The Gefle deals ex Abergrange we consider well sold at £14 10s. for mixed 3x9, and the 3rd £10 15s., with 4ths at £8.

The Sundswall parcel ex Diana was cheap at £12 15s. for the mixed deals, and, though not so well favored in the upper sorts, the room apparently did not make any distinction in the price of the next lower qualities between the Gefle and the higher port.

We consider Sundswall 4th and 5th every bit as good as Gefle; in fact, in many respects, rather to be preferred, leaving out the two leading productions.

The room was a full one on Thursday's sale, and the trade seemed in rather better humor to buy, though with such a long spell of frosty weather and consequent stagnation in the building trade, dealers have no inducement to go in largely, and though in a few instances several lots fell to one buyer, the parcels were mostly distributed over the room. Battens appear to be a drug just now, the natural result of the check building operations have received, and most of the lots were bought speculatively rather than for supplying any immediate demand. We shall not be surprised to find this class of wood improving in price when the present frost disappears, which cannot, in the natural order of things, be much further delayed, that will be the time when those who have bought so cheaply now will reap the benefit.

There is no question that but that stocks now are very heavy, but the late opening of the shipping ports will come to the assistance of the market. We shall be having mild spring weather here to carry off the stuff weeks before the Baltic ports are open. The Swedish lower Gulf deals submitted without reserve were not the same fine stock usually coming from that favorite district, the Gefle ex Hispania being S P, and at £12 5s., though it reads low for 1st and 2nd red, was a fair enough price as things go. The flooring seemed a bit better, but we cannot say the demand took an active turn. A change to mild weather, we believe, would work wonders.

Hewn and sawn the dock deliveries are about 700 standards behind the corresponding week last year. That building has received a serious check by the severe weather is allowed on all hands. The trade seems to consider itself frozen up, and to acquesce in the visitation, jobbing a little here and there, just to keep its hand in, and thinking it useless to attempt to do more till a great thaw comes and melts the ice and the hearts of capitalists at the same time. On Monday, the 8th, the thermometer, in a sheltered situation, stood 20 deg. at 7 o'clock, the lowest of all the winter, and there have been eight to ten degrees of frost at the same hour ever since.

As illustrating the sanguine hopes which influenced many of the trade at the close of last season as to prospects improving with the new year, we may instance the Petersburg boards ex Ebrow sold by Messrs. Churchill & Sim, on last Wednesday, at £5 to £5 5s. per standard. When these goods were first brought in last November, we understood importers refused an offer of £6 10s. to clear the entire parcel of these sizes, some 120 standards 1x4, 4½, and 5, preferring rather than make such a reduction on the holding price of £7 5s. to take their chance of the market later on. From £7 5s. to £5 5s. is a great come down, leaving out of sight the dock rent and brokers' charges; yet we are assured things are rather improving—we may well ask since when?

LIVERPOOL.

The *Timber Trades Journal* of March 13th says:—The arrivals of timber continue very light in quantity, which is a matter for congratulation in the face of the small consumption going on at present. A visit to the docks shows an utter want of life and animation, and very little business is evidently being done, from the bare aspect of the carrying companies, wharves and railway stations.

Much of this depression is no doubt due to the continued severity of the weather, which is still so intense as to put a stop to what small quantity of housebuilding there is in progress.

In consequence of this, the distress amongst the laborers usually engaged in the various timber yards, and in the discharging of timber vessels, is assuming a grave appearance. To alleviate this as much as possible proposals are before the corporations of Liverpool and Bootle to commence public roadmaking and other works, and thus give some employment to those who are in such distressed circumstances,

The building for the forthcoming International Exhibition is making rapid progress towards completion, and happily is causing more work in the local joinery shops, which are now engaged in preparing the fittings for stalls, refreshment-rooms, etc., and this little spurt will be welcomed by a branch of the trade which for a long time past has suffered severely amidst the general depression.

We hear of little doing in arrival business, either for Baltic, Quebec, or pitch pine cargoes, and low as prices are, especially for the latter named goods, there is no disposition to buy ahead, the outlook being in no wise such as to induce prudent buyers to operate.

The freight market, in consequence, is in a dull and languid condition. The present quotations to Liverpool may be put down as follows: from Quebec, 20s. for timber, 45s. to 47s. 6d. per standard for deals; St. John, N. B., 17s. 6d. for timber, 42s. 6d. for deals; White Sea, 42s. 6d. to 45s. deals and boards; pitch pine ports, 29s. hewn, and 80s. to 82s. 6d. per standard for sawn timber and deals.

TYNE.

The *Timber Trades Journal* of March 13th says:—The snowstorm of the past seven days has been an effectual stoppage to all business, and has entirely laid aside all outdoor operations. Every railway leading from or to Newcastle has been more or less blocked with snow, some of them for days together. Your readers at a distance will have gathered from the daily newspapers some idea of the havoc committed and the amount of stoppages all works in progress must have sustained. To give to those at a distance some idea of the total stoppage of trade over the district, it may be remarked that the North-Easter Railway traffic return for the week ending March 6th shows a decrease of £7,733, in merchandise and cattle £14,962, and in minerals £12,650. The total decrease of the year up to March 6th as compared with last year amounts to £75,203, which are certainly most alarming figures to ponder.

No arrivals except a few parcels of hoops are reported from abroad.

A few charters for f.o.w. are reported as concluded during the last few days, but they are very few, the rates averaging about 24s. from Sundswall to Tyne.

Most of the saw mills have been closed the greater part of the week, and the time employed in carting away the huge masses of snow.

GLASGOW.

The *Timber Trades Journal* of March 13th says:—The indications of the state of trade afforded by the auction sales of timber and deals held here within the past week are not encouraging. Of a large catalogue, Quebec timber chiefly, submitted at Messrs. Allison, Cousland & Hamilton's sale at Greenock, on 4th inst., only a small proportion changed hands. The following were the prices:—

		Per c. ft.
Quebec waney boardwood—		
47 c. ft. avg. per log		1s 6d
Quebec yellow pine—		
60 c. ft. avg. per log		1s 1d
Quebec red pine—		
30 c. ft. avg. per log		1s 1½d
Quebec 2nd yellow pine deals—		
11 to 23 ft.	11/16×3	2s 0d

There were offers made for various other lots of timber and deals, but they did not come up to a figure satisfactory to the brokers the goods were withdrawn.

The sale at Yorkhill and Queen's Dock, Glasgow, on 10th inst., by same brokers, was also indicative of a dull state of trade.

Bay Verte spruce deals, 14 ft. 10x3, sold at 9½d. per cub. ft. A varied catalogue was gone over, comprising Quebec and Michigan pine deals, Pictou birch, &c., but failed to elicit bidding, the company showing unusual apathy.

The long-continued wintry weather is hindering outdoor operations and preventing improvement in the wood trade.

Imports during the past week have not been of importance. On the whole arrivals since the year began, chiefly made up at this season of teak and pitch pine, are under those of same period last year.

There has only been one arrival of deals since January—a cargo of spruce from Dorchester, N. B.

WINNIPEG.

The Winnipeg *Commercial* of March 22nd says:—There has been at last some indications of returning life in the lumber trade, though the actual movement has not yet assumed any decided proportion. The improvement noted has been principally in enquiries, which goes to show that contractors are now on the alert and making their calculations for the coming season's work. Dealers expect a fair trade to set in soon and with the steadier and firmer prices now ruling, together with the reduction in the supply, a more prosperous season may be looked for.

BOARD OF TRADE RETURNS.

The following are the returns issued by the Board of Trade, for the month of Feb. 1886; and also for the two months ending Feb. 1886:

MONTH ENDED 28TH FEB., 1886.

Timber (Hewn).	*Quantity. Loads.*	*Value. £.*
Russia	157	1,253

WOOD-WORKING PATENTS.

The following list of patents relating to the wood-working interests, granted by the United States Patent Office, March 16th, 1886, is specially reported by Franklyn H. Hough, solicitor of American and Foreign patents, 925 F. Street, N. W., Washington, D. C.

338,104—Rafting logs, &c.,—H. R. Robertson, St. John, New Brunswick, Canada.

338,005—Saw, drag—I. B. Warren and C. M. Potter, Waucoma, Iowa.

337,912—Saw machine, band—D. K. Allington, East Saginaw, Mich.

338,017—Saw mill, band—H. R. Barnhurst, Erie, Pa.

338,170—Saw mill, band—A. F. Griswold & & H. R. Barnhurst, Erie, Pa.

338,124—Saw mill, reciprocating—W. M. Wilkin, Erie, Pa.

338,125—Saw mills, saw sash for—W. M. Wilkin, Erie, Pa.

337,947—Sawing machine, circular—D. A. Greene, New York, N. Y.

PATENTS ISSUED MARCH 23.

338,669—Log turner—W. Ingalls, Mobile, Ala.

338,334—Lumber, device for binding together—J. T. Barber, Hanibal, Mo.

338,440—Lumber dryer—P. B. Raymond, Indianapolis, Ind.

338,570—Plane, bench—J. A. Traut, New Britain, Conn.

338,434—Saw mill set works—A. I. Loop, North East, Pa.

338,434—Saws, machine for rolling—L. O. Orton, Philadelphia, Pa.

THE HENDERSON LUMBER CO. Limited.

HUGH GIBSON,

MANUFACTURER OF

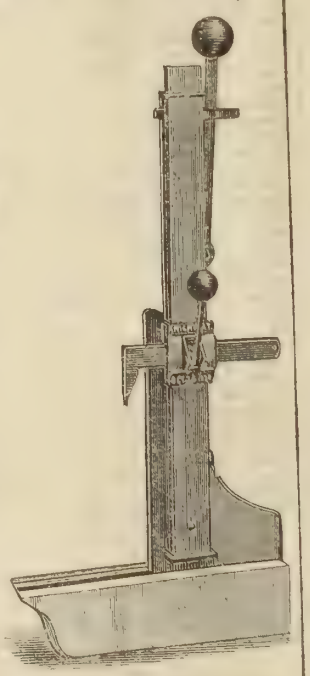
KNIGHT'S PATENT "EXCELLSIOR"

SAW MILL DOGS

The Sawyer's Favorite

For Holding Logs upon a Saw Mill Carriage while being Sawn into Lumber.

These Milldogs I guarantee to give satisfaction in every case. They will hold a frozen log as well as a soft one, for cutting Scantling, Square Timber, &c. These Dogs cannot be excelled, I sell them all on their own merits, give ten or fifteen days trial, and then, if not satisfactory, return them to my order, as I have no agents on the road this year, I will sell them at a reduced price. Send for Circular and price list.



EXCELSIOR DOG.

Manufactured by HUGH GIBSON, CHATHAM.

A. NORMAN, Medical Electrician

4 QUEN STREET EAST, TORONTO.

N. B.—Mr. Norman has had long experience in the Treatment of Diseases by Electricity, and will give his personal attention to every case, by letter or examination

Sisters of Charity

Charity, attached to St. Mary's Infant Asylum, Dorchester, Mass., certify to the inestimable value of Ayer's Sarsaparilla in the treatment of sore eyes and skin diseases, among the many unfortunate children under their care. Mrs. S. D. Bodwell, Wilmington, Mass., writes concerning the treatment of her daughter, who was troubled with sore eyes, as follows: "I gave Ayer's Sarsaparilla to

My Little Girl,

and must say that she never took anything that helped her so much. I think her eyes never looked so well, as now, since they were affected, and her general health is improving every day. She has taken but half a bottle." A. J. Simpson, 147 East Merrimack st., Lowell, Mass., writes: "My weak eyes were made strong by using Ayer's Sarsaparilla." C. E. Upton, Nashua, N. H., writes: "For a number of years I have been troubled with a humor in my eyes, and was unable to obtain any relief, until I commenced using

Ayer's Sarsaparilla

saparilla. I believe it to be the best of blood purifiers."

may be "fairest and foremost of the train that wait on man's most dignified and happiest state," but the dignity and happiness of man cannot long endure without the health that may be obtained in a few bottles of Ayer's Sarsaparilla. A. W. Parker, lumber dealer, 209 Bleury street, Montreal, Que., writes: "After being troubled with Dyspepsia for a year, and with Salt Rheum

For a Number of Years,

I was cured of both diseases by using six bottles of Ayer's Sarsaparilla." M. G. Traine, Duxbury, Mass., writes: "I have found Ayer's Sarsaparilla an efficacious remedy for bilious troubles and Dyspepsia." Henry Cobb, 41 Russell st., Charlestown, Mass., writes: "I was completely cured of Dyspepsia, by the use of Ayer's Sarsaparilla." Wm. Lee, Joppa, Md., writes: "I have tried Ayer's Sarsaparilla, and it has done me so much good that I shall always regard it as the best of blood purifiers." Eminent physicians prescribe Ayer's Sar-

saparilla

in all cases requiring a powerful alterative treatment.

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass., U. S. A.

For sale by all Druggists. Price $1; six bottles for $5.

SUBSCRIPTION

FOR THE

Canada Lumberman

IT WILL PAY YOU, BECAUSE :

1. It is the only newspaper published in the Dominion of Canada devoted to the lumber and timber industries.
2. It is devoted to the development and utilization of our forest wealth.
3. It furnishes complete and reliable quotations of prices of lumber in all the leading markets.
4. Its columns are filled with interesting reading matter, valuable alike to the land owner, manufacturer or dealer.
5. It costs only $2.00 per year to have it sent, post-paid, to any address in Canada, and no land owner, lumber dealer, manufacturer or individual in any way connected with timber industries, can afford to do without it.

☞TO ADVERTISERS.

It has a circulation among saw mill owners, manufacturers, lumber and timber dealers and all classes connected with the timber business.

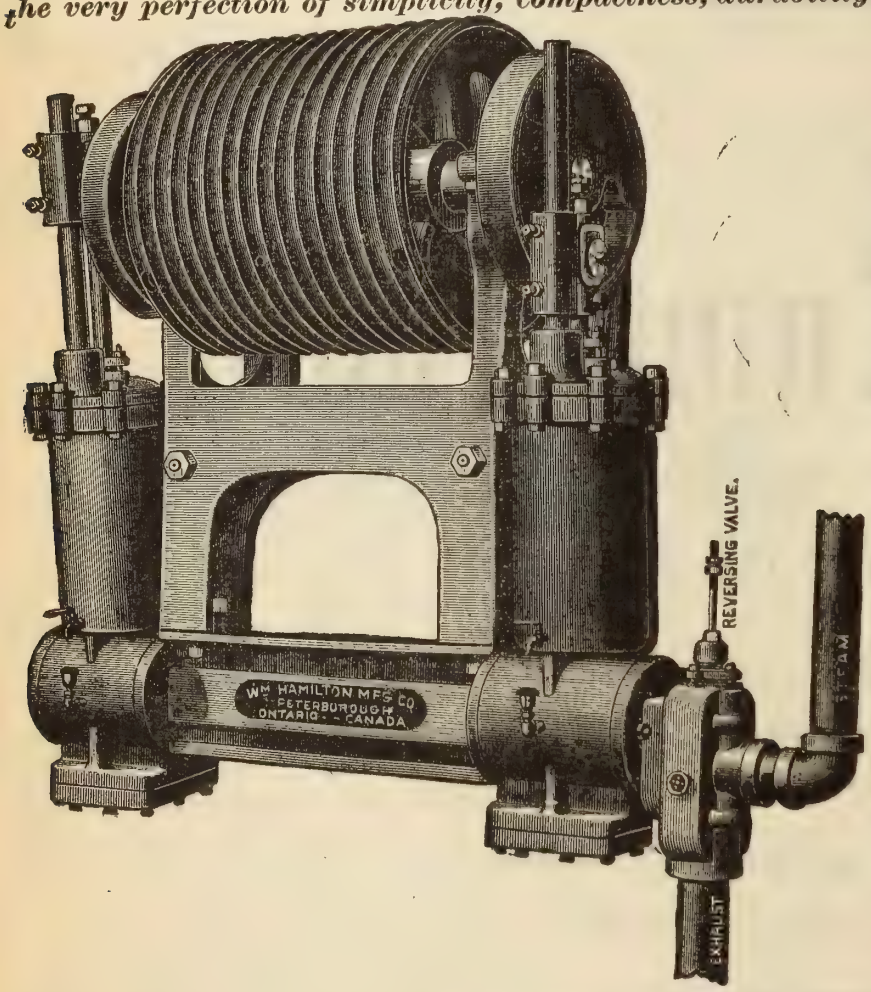
Examine the field, count the cost, and you will at once decide that the CANADA LUMBERMAN is the

———CHEAPEST, BEST, MOST RELIABLE and ONLY TRUE MEDIUM———

for placing your goods or wares before the saw-mill men and lumber and timber dealers of the Dominion.

CUNNINGHAM'S
PATENT OSCILLATING TWIN ENGINE
FOR STEAM FEED IN CIRCULAR MILLS WITH RACK OR ROPE.

This Engine has practically but two moving parts, aside from cranks and shafts. The whole array of eccentrics, valves, valve rods, connecting rods, cross heads, slides, levers, rock shafts, bell cranks, etc., is done away with, and the very perfection of simplicity, compactness, durability and cheapness attained.



The above engraving illustrates the Twin Engine, 10x16, for Rope Feed, for Saw Mill Carriages. The spool is 27 in. diameter, 30 in. face, is grooved 2 in. pitch for 1½ in. rope. The shaft is steel, 4½ in. diameter, with disk cranks. No connecting rods, eccentrics or valve rods to get loose and out of order. The ports are in the trunions, and worked by an oscilliation of the cylinders, and are held in their place in the downward motion by a steam cushion below. The sawyer's valve is a perfect balance, and by moving this valve the engine can be reversed, stopped or started almost instantaneously if necessary, as the sawyer has perfect control of it by his lever either to go fast or slow. Should the sawyer let go of his lever either by mistake or any other cause, it is balanced so that the valve will come to the centre and cut the steam off both cylinders and stop the feed. When standing, the lever is locked or fastended, so that is is impossible for it to start off itself. The engine stands upright below the carriage, and bolted to two upright beams, placed on the mill for the purpose. When a rack is preferred in place of the rope, we put on a steel wheel 30 in. in diameter, and the engine placed high enough to work into the rack on carriage bar, or if the beams come in the way, an idler wheel can be used between engine and rack segs; or, the engine can be placed at a distance and have a shaft from it to the carriage; or it can be placed in the engine room, where it is under the control of the engineer for oiling, thence by shaft and pinion to carriage rack bars. These engines are well adapted for cutting long logs, or where the logs are mixed, the advantage of this feed will be apparent to mill men. When the carriages are used in two or more sections, the couplin and uncoupling of each section is quick and simple.

There were two of these feeds working this summer and giving the best of satisfaction, one with rope feed at James Playfair & Co's Mill, Sturgeon Bay, near Waubaushene, and one at the new mill furnished by us to Francis Carswell & Co., at Calabogie Lake, on the Kingston and Pembroke R. R. This mill is working with the Rack and Pinion feed, and drops from fifteen to seventeen stock boards per minute. We have also sent one to the Rathbun Company, Deseronto, to put in to feed their heavy Circular Mills. They will also commend themselves for various other cases, especially for running Elevators, hoisting Engines, and wherever a simple and easily reversible motion is required.

We would also call attention to our Improved Hand Saw-Mill for cutting logs

☞ *We guarantee this to be the best Mill of its kind got up, and would ask any one wanting a good Band Saw-Mill to communicate with us. We would also call the attention of Mill Men to our new IRON GANGS, CIRCULAR MILLS and MILL MACHINERY. For further information, prices, &c., address the Manufacturers,*

VOL. 6. PETERBOROUGH, ONT., APRIL 15, 1886. NO. 8.

THE OUTLOOK FOR VESSELS.

The Kingston, Ont., *Whig* of a recent date says:—

There is considerable difference of opinion in regard to the opening of navigation and the marine trade. Some vessel men do not think the outlook is all bright, or that business will increase as the season advances. There are others who say that the vessels will be kept moderately busy, that there will be considerable freight to handle, and that some thing like living rates will be paid. Already in American ports the indications are favorable, and charters at Chicago are higher than they have been at this date in three years. "I know for a fact," said a vessel owner, "that Dunham's fleet have been chartered, some to go to Georgian Bay and some to go to Buffalo. The rate to Buffalo is 5½ cents per bushel on wheat, a figure higher than has been paid in very long time. I am also told that higher figures have been obtained by other vessels. A few days ago I read that charters to Oswego at 5½ cents per bushel was refused. That was higher than the rate paid during the whole of last year. Another thing I know, that more vessels have changed hands in Chicago and Detroit during the past three weeks than have changed in as many years previously."

The ore trade promises well. More furnaces are going in the States now than heretofore, and of course the best Canadian ore will be in demand. Considerable of the article will be shipped from Kingston. Vessels that have received only 70 cents per ton for carrying ore from Escanaba to Ohio ports have been chartered this year at $1.10 per ton. There will also be a good deal of phosphate handled here. Some of it will be carried across the lake, while considerable will go to Montreal en route to Europe.

Of lumber the sales have eclipsed those of many previous years. More lumber will be sent from Ottawa to Oswego by the Rideau Canal than ever before. Then there will be a good business in posts and ties. As far as square timber is concerned, much of that which came from upper lake ports will be carried by steam barges and consorts. Sailing vessels are not now given much of this freight. "The steam barges can handle it cheaper than we can, said a well-known captain. "Ten years ago a timber dealer would charter 100,000 cubic feet for a schooner, which would keep her busy the whole of the season; but now they can get that quantity handled at one trip by the barges and their consorts, and get the stuff to market early in the year." A vessel-owner has chartered his craft from Toledo to Kingston for four loads of timber at $50 per M cubic feet. This a remarkable low rate. "I imagine," said captain Booth, who was seen after the others had spoken, "that the marine business will be quick after navigation opens."

The longshoremen of Oswego have fixed the following sechudle of rates for handling cargoes: All vessels and barges of 300,000 feet capacity and over, 25 cents per thousand for the entire season; all barges and vessels under 300,000 feet capacity, 20 cents per thousand until August the first; after August 1st, 25 cents per thousand; shingles, four cents per thousand; lath, five cents per thousand; timber, board measure, 35 cents per thousand; hop poles, $3 per thousand; heading, 15 cents per thousand; hardwood 30 cents per thousand; posts, 30 cents per cord; stave bolts, 35 cents per cord; blocks, 30 cents per cord; cedar ties, 1½ cents apiece; all other ties 2 cents apiece; telegraph poles five cents each. Captains here, who have examined the list, say that the rates are such that they cannot pay, and they advise that in handling timber, etc, the contracts be made f.o.b. in and out, thus letting capital and labor fight the thing out.

Mr. Davis' shipyard is a busy one. The steam barge Freemason has been remodelled as to upper works; two steam yachts are being finished, to be ready for service in May. One of them is for Mr. Miller's use at Peterborough. A large sail boat has been built for Dr. Clarke The yacht Laura has been lengthened and in part remodelled.

The str. Rideau Belle has been lengthened 16 feet, giving room for an addition of four state rooms and a ladies' cabin. A compound engine, from a Detroit model, being manufactured for her by McEwen & Son, of Kingston, will greatly increase her speed, and make her more popular than ever. She will run to Smith's Falls on the Rideau, connecting with the steamer Olive for Ottawa and Montreal, thus making a through line on a most picturesque route. Captain Noonan, of the Rideau Belle, will make it very pleasant for passengers and tourists. He will be assisted by Captain Fleming, formerly of the steamer Gypsy.

At Breck & Booth's wharf considerable repairs have been made to the schooner F. J. King. She has been altered from a two-masted to a three-masted vessel. New decks have been added, and such other improvements made as will make her a first class vessel. The cost has been about $3,000. The schooner Jessie H. Breck has also been overhauled and repaired and will come out with a new suit of canvass. Her old sails were destroyed by the fire in Lewis' chandlery store. Captains of the vessels are: King, Capt. Griffin; J. H. Breck, Capt. E. A Booth, jr. The schooner Breck will clear as soon as the ice disappears, for Oswego, where she will load coal for Hamilton, bringing back a cargo of timber.

Extensive repairs have been made to the schooner W. R. Taylor. She has new decks, deck frames and other needed requirements. About three thousand dollars have been expended upon her. The schooners White Oak and Herbert Dudley have also undergone needed repairs.

The expenditure in fitting up the steam barge Tecumseh and her consorts, the M. C Cameron and Cavalier, will reach over $6 000 The work has been under the supervision of Capt. Theo. Allen. The officers of the crafts are:—Tecumseh, Capt. Manson; M. C. Cameron, Capt. J. Miller; Cavalier, Capt. Anderson.

The captains of the other vessels in port are: Schooner Annandale, Capt. Patterson; schooner Folger, Capt. Dandy; schooner Grantham, Capt Simmons; schooner Oliver Mowat, Capt J. Saunders; schooner Herbert Dudley, Capt. J. Parsons; schooner White Oak, Capt. Joseph Dix; schooner W. R. Taylor, Capt. James Dix.

Capt. R. Coutts, of Bowmanville, has been engaged to command the schooner Acadia Capt. Wellbanks, who was in command last year, has opened a lumber and coal yard at South Bay.

A Montrealer will ship over 1,500 tons of iron to the west. The iron will be brought to Kingston on barges and transhipped for its destination into vessels.

A REMARKABLE LUMBER RAFT.

The St. Louis *Globe-Democrat* says:—The only raft of lumber that ever ran from the mouth of the Wisconsin river through to New Orleans was started in June, 1867. There was 1,100,000 feet in the raft. It required over two months to complete the trip, and cost the owners over $1 500 aside from the cost of pilots which was nearly $500. There was a change of pilots three times—one running from Wisconsin to St. Louis, one from St. Louis to Vicksburg, and one from there to New Orleans There was a crew of thirty men upon the raft, and they slept and took their meals on the fleet. Thousands of people viewed the raft after it had passed Vicksburg, for the people that far south had never seen a raft of such mammoth proportions, and long before it reached the Crescent City it was known as "the floating city." At New Orleans several tugs with city officials aboard and many prominent citizens came out to meet the fleet. A peculiar fact about this raft was that, after it was taken out on the bank at New Orleans, there was a sudden sharp advance in lumber figures at St Louis, and the owners concluding that they could make more money out of it here than at New Orleans, had it brought back on barges and cars at a greater loss than it was sent down for.

THE Michigan vessel men are endeavoring to form a combination for the purpose of delaying the shipping of lumber until what they regard as a remunerative price for freight shall be offered.

PECULIAR LUMBER SHIPMENT.

A Cumberland county, Nova Scotia, lumberman is engaging in a novel enterprise. He proposes to take about 3,000,000 superficial feet of piles, logs, spars, hardwood timber and boards to New York in the form of an immense raft. The dimensions are: Length, 410 feet; width, 55 feet; depth, 35 feet; and it will draw 21 feet of water. It is being built upon a well constructed cradle which will be launched with the raft and removed from it in the water, leaving the raft with the chains and binders to support itself. It is torpedo shaped at the bow and stern, and a cross section amidships will be in the form of an elipse. It will, when completed, weigh 8,000 tons The weight is so distributed over the four sets of launchways as to exert a pressure of eighty pounds to the square inch, which is about two-thirds the pressure allowable on ordinary launchways. When completed the cost will be about $20,000.

It is proposed to tow the raft to New York by an "ocean tramp" or by two tugs as soon as lauched, which is expected to be midsummer. There have been occasional lots of spruce piles fastened together and towed to Boston or New York but they have been very small compared with the proposed raft and inquiry among Boston dealers fails to reveal that any shipment approaching anywhere near the size of the one psoposed was ever before known.—*Ex.*

"WORTHLESS" LUMBER.

Furniture makers are to-day using lumber which was called worthless ten years ago. Whitewood or poplar is used in immense quantities. The growing scarcity of our natural supply of lumber leads manufacturers to experiment with so-called "worthless" varieties. Cypress is working into favor for architectural finish, and we would not be surprised if some enterprising manufacturer should come out with a most desirable piece of furniture, possessing a delicate, finely marked grain, and yet consisting of nothing but unpretentious cypress. Hard pine makes a nice looking job when finished in good shape, but has the serious objection of being full of pitch. Cypress has much the same appearance as hard pine, but the pitch is happily absent The wood commonly known as "gum" has been successfully utilized. It being worked into a great many forms, despite its well known warping qualities, which are represented as being so great that the lumber "will not stay in the same county two successive nights." We are informed that picture frames have been successfully made of gumwood, and rumour adds that the very qualities that have hitherto condemned it have been utilized in the manufacture of self-rocking cradles.—*Building.*

EFFECT OF SALT IN WATER.

It is well known that a salt dissolved in water raises its boiling point. A saturated solution of common salt boils under atmospheric pressure at between 227° and 228° Farenheit, instead of 212° as fresh water would have done. It was now an open question what the temperature of the steam or vapor which comes off from this brine will be. Some authorities claim that being in all respects like the steam from fresh water it will have the temperature of common steam at the atmospheric pressure, i. e., 212°, while others claim that the steam will be at the temperature of the boiling brine, and hence superheated or above the temperature due to its pressure.

It is obvious that at the instant of formation the steam must be at the temperature at which the solution boils. The increased cohesion of the molecules of water due to the solution of salt, requires more heating to separate them and the temperature, at which their cohesion is overcome, and they take the form of steam, is raised. Starting with the temperature of the solution, 228°, the bubbles of steam pass up through the hot brine, certainly losing none of their heat, for the brine is at their own temperature, and are freed at its surface. Now when these bubbles of steam appear at the surface of the solution from which they are generated, and fill the steam space of the vessel in which it is contained as fresh steam of atmospheric pressure, what becomes of the extra heat which it contains? A portion of it will be rendered latent in the evaporation of entrained water in the steam, a portion will be radiated from the walls of the vessel, but the steam will show a temperature considerably above 212 degrees, i.e., it will be a considerable degree superheated.

A florence flask holding a litre was filled with a saturated solution of common salt. By the application of heat the temperature was raised to nearly 258°, when violent solution took place, and a thermometer whose bulb was immersed in the brine became stationary. The long neck of the flask was by a cork having two holes, one for the thermometer and the other of a size sufficient to allow the steam to escape freely. This neck and that portion of the flask above the water line were therefore full of steam at the pressure of the atmosphere, and by drawing the thermometer out of the brine and allowing it to remain in the steam the diminution or increase of temperature could be noted. In every instance in which this was done the temperature fell from nearly 228° in the brine to 221° in the steam, no noticeable variation in the figure occurring with the change of position of the bulb in the neck between the lowest point which the water could not boil up upon it, and the highest position to which it could be raised in the neck.—*Boston Journal of Commerce.*

SOME REMARKABLE TREES.

In Madagascar is to be found a tree called the traveller's tree, yielding a copious supply of fresh water from its leaves. As it will thrive in any arid country where planted, its benefits to the traveller are great.

In Venezuela there is the cow tree, which grows on otherwise barren rocks. Its leaves are feathery and crisp, but by making incisions in the trunk a peculiar greyish milk comes out, which is tolerably thick and of an agreeable balmy smell. The natives gather around these trees at sunrise and bring large bowls with them to receive the milk, for towards mid-day the heat of the sun turns the milk sour. The sight of cow trees puzzles the innocent traveller, who cannot account for the trunk being plugged up all over with bungs and short sticks. The natives also use the milk as a gum.

The butter tree was first discovered by European travellers in the centre of Africa; from the kernel of the fruit is produced a nice butter, "which," says Livingstone, "will keep a year." On a par with this is the Manna tree, found in Calabria and Sicily. In August, when it is the custom to tap the tree, a sap flows out. It is then left to harden by evaporation, after which the manna, of a sweet but somewhat sickly taste to any but those accustomed to it, may be gathered. In Malabar there is the tallow tree. From the seeds of this, when boiled, is produced a firm tallow, which makes excellent candles. The guava tree of the Indies bears a fruit giving large quantities of a rich and delicious jelly.

But the most remarkable tree yet discovered flourishes on the island of Fierro, one of the largest of the Canary group. The island is so dry that not even a rivulet is to be found, yet there is a species of tree the leaves of which are narrow and long and continue green throughout the year. There is also a constant cloud surrounding the tree, which is condensed and falling in drops keeps the cisterns placed under them constantly full. In this manner the natives of Fierro obtain water, and as the supply is limited the population must of necessity be limited too.

In Japan and some islands in the Pacific there is the camphor tree. The camphor forms in the trunk of the tree in concrete lumps, and some pieces have been found as thick as a man's arm.

The sorrowful tree is found only in the island of Goa, near Bombay, and is so called because from morning until the time of sunset no flowers are to be seen, but soon after it is covered with them. As the sun rises the petals close or fall off. Stranger still, the flowers blossom at night all the year round and give out a most fragrant ordor.

There is another curious tree in Jamaica known as the life tree, on account of its leaves growing even after severed from the plant. Only by fire can you entirely destroy it.—*Lumber World.*

LINDSAY.

A Long Run.—About the 15th of April Mr. J. Coburn, well known as the oldest foreman in timber circles in this district, expects to leave with a force of seventy men, to bring down logs and timber for Rathbun & Co., Deseronto. The logs come from Deer Lake into Crow river, thence to Crow Bay, on the Trent river near Campbellford; and thence to Bay of Qunite at Trenton. The timber passes through Haliburton, Peterborough, Hastings, Northumberland and again Hastings, to Bay Quinte—a long run.

Factories and Workshops.—We have been 'looking around" to see what factories in addition to those already here would pay in Lindsay. Our people should not look forward to gigantic industries in many departments similar to Sylvester Bros' works; but there seems ample room in the fertile belt that lies between Lakes Simcoe on the west and Pigeon on the east and the "Pine Ridge" on the south and Nipissing district on the north to guarantee the support of other moderately large factories. Tin lined butter tubs, cheese boxes, woodenware, sewing machines, felt and leather boots and shoes, buttons, besides a dozen and one other industries might readily command an unlimited market at home. Let some of Lindsay's citizens with latent wealth invest their surplus capital and thus improve their own and their town's future. Efforts should also be made to induce the Grand Trunk to increase their workshops here. As a rule railway men are good citizens and add wealth to a town.—*Warder.*

Mr. Ralph Maxwell has completed his winter's bush work, broken camp and is now at the Cataract House. He has got out upwards of 75,000 feet of fine board timber for his father, Mr. F. P. Maxwell, of Toronto. It has been hauled onto the ice on Pickerel Lake and boomed, ready for the break-up. This fine lot of timber will be floated to Burk's Falls and shipped to Collin's Bay, near Kingston, via the Northern and Pacific Junction to Toronto, and by rafting to Collins Bay. If the railway is not ready to receive and carry freight in time, the timber will go the old route via the Maganettawan river to Byng Inlet, where it will be barged and taken through the Georgian Bay, Lake Huron, the St. Clair river, Lake St. Clair, Detroit river, Lake Erie, thence through the Welland canal, Lake Ontario to Collins Bay. Mr. John Wagner, Mr. Maxwell's clerk, says the winter has been a favorable one for the bush and that the timber they have taken out is of a very fine quality.—*Burk's Falls Arrow.*

THE

Gutta Percha & Rubber Mfg. Co'y

T. McILROY, Jr., Manager.

MAIN OFFICES and WAREHOUSE at the Factories, 135 to 155 West Lodge Avenue, P.O. Box 494. TORONTO

The largest Manufacturers in the world of Vulcanized India Rubber Goods for mechanical purposes.

Rubber Belting from ONE to SEVENTY-TWO inches wide. ***Hose,*** for conducting, suction and steam. ***Packing,*** Cloth Insertion and pure ***Tubing*** of all kinds. ***Rubber, Linen and Cotton Fire Hose. Leather Belting,*** Extra heavy American Oak Tanned.

☞ *A Full Stock always on hand. Write for Price Lists and Discounts.*

Works also at NEW YORK and SAN FRANCISCO.

New York Lumber Auction Co.

(LIMITED.)

OFFICE AND YARD, Foot West 21st Street, New York City.

REGULAR SALES will be held during the year 1886, as follows:

Tuesday,	*April 6th,*	*Tuesday,*	*August 10th,*
do	*May 11th,*	*do*	*September 7th,*
do	*June 8th,*	*do*	*October 5th,*
do	*July 13th,*	*do*	*November 2nd,*

and Tuesday, December 7th.

Sales commence promptly at 10.30 a.m. Wm. Easton, Auction'r

At each of these sales we shall offer a full and complete assortment of the best grades of

HARDWOODS AND PINE LUMBER.

Dealers and consumers will find it to their profit and advantage to attend. Catalogues giving the inspection of each lot offered can be had at the yard on the day of sale, or will be mailed on application. Address

DIRECTORS:

GEO. A. COX, President. J. R. DUNDAS, M.P., RICHARD HALL, Vice-Presidents. W. Cluxton. W. Gooderham. Richard Hall. J. Stevenson. E. S. Vindin. F. C. Taylor. J. M. Ferris, M.P.P. Robert Jaffray. D. W. Dumble.

BANKERS—Bank of Toronto and Canadian Bank of Commerce.
SOLICITORS—Dumble & Henry.

TO DEPOSITORS—Deposits are received by this Company both on current account and for periods of one year or longer. The rate of interest paid on amounts deposited on current account and which may be withdrawn by check in such sums as the deposit or may from time to time require, is FOUR per cent., either paid or compounded half-yearly, and the rate on yearly deposits is FIVE per cent.

TO INVESTORS—The five and ten year FIVE PER CENT DEBENTURES of this Company which are issued in denominations of $100, $200, $500 and $1000 each, transferable by endorsement, with half-yearly interest Coupons attached, payable at the Head Office of the Company in Peterborough, or at any Branch of the Bank of Toronto in Canada, afford a safe and convenient mode as investment.

The funds of the Company being invested in first mortgages on Real Estate, no better security can be offered to depositors or debenture holders, they having a first claim or mortgage on the whole Assets of the Company, the shareholders having the second. The annual statement shows that the amount invested was over $800,000, and on the security of real estate at least double that value.

By the laws of Ontario, Trustees, Executors and Administrators may deposit Trust Funds of the estate, which they control in this Company, and are free from all further liability, a privilege of which many have largely availed themselves.

TO BORROWERS—Money is obtainable from this Company on approved Real Estate security at the Lowest Current Rates of Interest.

The Mortgage may be repaid by yearly instalments, or otherwise, as may be agreed upon, the interest ceasing at once on all amounts paid on account of the sum borrowed.

Applications may be made either to the Head Office, or to any of the Agents.

Head Office, George Street, Peterborough, adjoining Bank of Commerce.

D. M. SIM, Secretary-Treasurer. GEO. A. COX, President.

FILING SAWS—THICK AND THIN SAWS—PITCH AND NUMBER OF TEETH.

The circular saw to-day is a tool that few have mastered. There is a vast difference between the kind of saws required for small mills and those needed for large, fast-cutting mills The great trouble with most circular saws is that they have too much set. Some 8 gauge saws have 5-16″ set. This requires 25″ more power, and the constant strain on the saw tends to buckle it, for it has no support, as the space between the saw and the log is 3-32″, and this allows the saw to bulge that much betwixt the teeth and the centre, which will soon cause it to buckle or dish. But the worst evil of all is that the saw kerf is nearly as great as if not more than the thickness of the plate, so most of the dust that is cut out by the set is allowed to pass down between the side of the saw and the log, and this heats the rim. It is clear that 5-32″ cannot carry 9-32″ ahead of it when the tendency is for the tooth to press through the dust. Saws that are sharpened on an automatic sharpener overcome this difficulty to a great extent, as the throats are kept square and the edges sharp. But we cannot afford to sharpen a pony mill by the automotic device, and the saw throat does not wear so much, as it carries only about two inch feed. This kind of saws should be gummed but little, but the operation should be performed very often to prevent gumming, as they always dread it, some mill men make the teeth 2″ long instead of 1¾″, and consequently the saw brings dust enough back to keep the sawyer and tail sawyer covered. If his teeth were 1¾″, the saw would be all right when it came from the gummer. It should be about an 8 gauge 56″ saw with 36 teeth, with as much pitch as possible.

For this mill the sawyer wants a good upset, not a good sawyer and a bad upset, and as the upset is used in nearly all mills of larger capacity I will state how it ought to be employed. The upset should fit the tooth exactly, and the first blow must be lighter than the rest, so as to guard against a break. The swage should not be held too far over or too near the operator, as the result will be a broken corner or point, or the saw will be out of round. Great care should be taken in holding it square across and level, otherwise, when the front is filed square, the tooth will be at an angle, and to overcome this there must be as much filing on the back as on the front to get the tooth square, and then the set is nearly all gone, so more swaging must be done. Probably the next tooth will be swaged better, and it will then be longer. Such work with an upset fractures many corners and weakens others so that before the first log has been sawed they break, then the saw maker and the upset are blamed. If the upset had been properly used the teeth would not have been broken. A few strokes of the file are sufficient and a light touch on the back, then side-file, and the saw is ready for work so far as filing goes. I am speaking to show the difference in the way saws are managed, I know plenty of just such sawyers, and their employers are no better.

A sawyer recently came into the mill I am connected with, and I happened to meet him in the yard, we were strangers, but being "brothers" soon got acquainted. Going over to the mill we passed a lot of newly sawed boards 12 feet long, and on seeing them my companion stopped me, looked at them, turned one over, put on his spectacles, looked again rubbed his hand over the board and then said to me:

"You carry pretty good feed."

"Sometimes we do," I answered.

"Yes," he said, "you were cutting over a 12 foot feed when you sawed these."

"Oh, no," I answered, "that's beyond all reason."

"No," he replied, "I have never been in a mill yet where I could not tell the feed as soon as I saw the lumber. I have been saw-milling since 1850 and know something about a saw, and don't you forget it."

I told him he must call the length of the board the feed.

"No," he replied, "show me the feed that saw cut if you can."

"I can't," I said.

"It is you who don't know what feed is, can't you see that saw cut that board before it made a revolution?"

"No," I said, "but tell me how you can always find out so easily the feed of a saw."

"Well, I'll tell you," he said, "When you see the marks on the board the distance between them is the feed, and I know the saw that cut these boards was cutting over 12-foot feed, because the lumber is smooth from one end to the other and has no marks."

"Look around," I replied, "and you will see that all our lumber is smooth. Our saws do not mark the lumber."

"How can you help it?" he asked.

"I keep my saws round."

"But when 'she' loses a corner or two.'

"But she 'keeps' them."

"But doesn't she mark anyhow?"

"No. I use the side-file which makes an even set."

"You file on the side. I file that way."

Then I told him I referred to a file made and put in a frame for the purpose. He had never seen one.

We went on to the mill, he looked around a little and then left without saying good-bye He was a sawyer of 35 years experience. So among sawyers there is as much of the "cutting out for a sawyer and missed in the making" as with the farmer and the merchant. The farmer who knows how to manage his farm will succeed, while his less skilled neighbor can scarcely make a living. One merchant will get rich, and the dealer next door will fail.

In using the file it is essential to be able to detect when it is working "square." The sound of the file must be the operator's guide If the files squeak, it is too far over and out of the timber. If it cuts a clear cut, it is too far in. When the file is pushed square there is a slight squeak, nearly a clean cut. About one sawyer out of 20 will file nearly right. I know that perfection cannot be attained, but as a general thing the sound of the file makes your flesh crawl.

A few sawyers file a clear cut in front and then to get the tooth square, it is squeak, squeak on the back of the tooth and the saw is then generally filed into the timber. To run a file straight without rocking is more of an art than square filing. When the file is pushed straight, the front of the tooth will have the same light from edge to edge, but if the least rock is in the file it will be shown by one side being a shade darker than the other. Only a good eye can apply this test. I would like to hear from some others on this subject.

When the tooth is finished, and the centre of the tooth higher the file has rocked a little. If the centre is apparently lower that shows good filing.

Mills of 25 M to 40 M per day require a saw entirely different from those I have been describing. I see some of my brother sawyers in writing for your paper omit to mention the difference in the saws of different capacity. The 8 gauge 56 inch, with 36 teeth, would run in our mill hardly long enough to saw up one log. We use No. 8x8 gauge, 64 in., 100 teeth; speed to 10,500 feet on an average feed of 6 in. and 8 in. and often 12 in. and 16 in. Our saws do not need as much pitch as the other and would not run with as much, § is what I give them with ¼ scant set. The teeth are 1§″ long, the back as high as I can run to clear, which is pretty close, as the teeth are close together, but none, on an average, cutting over 1-16 in., but no more than the former with 56 in. teeth. But they can be easily crowded beyond that, so the teeth are not keep in a strain by being forced to do all they can. We saw cypress have the fastest cutting mill on the principal Mississippi river and make the best lumber.

We cannot cut as much as the pine mills, for our timber is large and cannot be handled quickly, some sticks making as much as 8,000 feet board measure. We average 25,000 and 30,000 and have gone beyond this, on a 12 block and hand feed shingle machine. We cannot run thinner saws because the bark is of a hemp nature, which is very tough to cut. I hammer my saws about once a week, but have no regular time. The tension will last about two weeks (I am including all the saws for log sawing).

We change three or four times a day, but cannot be regular, as timbers covered with mud may necessitate changing a little sooner. I never file our board or log saws, but sharpen them altogether on Covel's automatic sharpener, which gives an edge that will last much longer than the file. The corners are not worn so much as they are by hand filing.

We use the Kinny swage. as it is generally known. It is sold by M. Covel, Chicago. It gives entire satisfaction, for it is much quicker in operation than the upset and saves saw plates. I had about the same trouble a great many have had in getting it properly adjusted, but it is indispensable in a large mill.

I am an advocate of thin saws. They save timber, power and are much to be preferred when fixed up in the mill, but they have one serious fault, and this is that they are very liable to get sprung. If the filer understands his business it is only a few minutes work to repair them, but where it is necessary to send them to a saw hammerer some distance away, expense and delay follow.

Thick saws "stand the racket" better. Thin saws need more teeth and require more hammering. They will not hold their tension long I am alluding now to fast mills. Thin saws work better than thick one in smalls. if the sawyer has a fair knowledge of his trade. If not a thick saw should be used It is never necessary for them to be sprung set. I believe in the work being regular on the point of the teeth, and as the corner does nearly all the work, sprung set teeth do nearly all their work on one side. They run heavier for several reasons, one is that the teeth do not cut clear, they wedge in cutting, and the side that has no corner is exposed to a great friction, and in knots will often spring and break out. A great many say the spring set runs lighter. They probably experienced with a saw that had twice as many teeth as it needed if the sawyer will take a saw with 100 teeth and another with 50 teeth and fix the latter up "double set" it will make smoother lumber and run longer than the other. There is exactly the same number of corners in both cases. but the spring set teeth will spring and lose their set. Some say the double set will lose their corners, but they never will if they have been fixed up right. They might if they had 5-16″ set, but we do not care about wasting that much timber, power, saw plate and money.

For shingle and small, thin circulars only spring set will do. The inserted tooth will not do; there are one or two makes which answer better than others and are used by a great many. I do not think they have dust room for the number of teeth needed for fast sawing, and if they have enough they are so close together as to leave hardly sufficient saw plate to hold them in. The throat soon lets the dust pass on each side, as I have described, heating and expanding the rim and loosening the teeth and soon out they come. These saws require more hammering than others, because the jamming and driving necessary in putting in new teeth and rivets stretches the rim. They are in use, as a rule, only in the small mills or for soft timber like white pine.

As regards the makes of saws I have but few preferences. Some are a little better than others, but they will all run. One thing may be said with reference to the manufacturers who make saws without hammering. Their saws generally show more hammer prints and lose their tension quicker than those of some other makers. The tension cannot be put in a saw to stay. Gumming, the constant strain and the centrifugeal force stretch the rim. But the worst trouble of all is the heating of the rim, for then the rim is laboring four different ways to give the hammerer work, and he soon gets it —*J. H. M. in Saw Mill Gazette.*

Messrs. Ira O. Smith, of Michigan, and J. H. Swan, of Chicago, within the past week or two have bought thirty-five million feet of pine timber in northeastern Missouri. Mr. Smith informs that they expect to buy about one hundred million feet of pine in that vicinity and are continually buying small quantities. "We have great faith in pine trees," remarked Mr. Smith, "and have bought these as a speculation."—*Muskegon Chronicle.*

MUTUAL INSURANCE.

A movement is on foot in England for founding a "Mutual Insurance Association for Saw Mill Owners" The idea was mooted a few years ago, but for sometime has been in abeyance. An effort is however, being made to give it practical shape. The scheme is outlined in the *Timber Trades Journal* as follows:—

"It is proposed that the insured become shareholders, in the proportion that they participate in the benefits of the company in the same manner that is now adopted by many shipowners, in the insurance of their ships, but that no one policy, in the early days of the Association, at all events, be larger than £2 000; that certain well-digested rules be laid down for observance by the insured, with the object of minimising the risk of fire occurring on their premises; that a scale of charges be laid down, regulated by the quality or condition of the risk, as favorable to the insured as can reasonably be framed to carry on the successful working of the undertaking, and it is hoped this would not exceed 1½ per cent. There would, of course, be various questions to be decided by the directors or other officers appointed, such as naming a time before which a loss shall be claimed in full against the Association in the event of fire, also the foundaton of a reserve fund and other details.

"The object of forming such an Association is to mutually assist owners of saw mill property to insure at reasonable rates of premiums, as the present system of being dependent upon companies, who do not specially lay themselves out for such business, is felt to be an injustice, especially so as their rates are at times out of all proportion to the nature of the risk.

"The rates of premiums imposed in many cases are such as to impose a heavy tax upon saw mill owners, such a tax that no small number are uninsured, or only partly insured, as they prefer to carry all or part of the risk themselves, and to become their own insurers, to paying extortionate premiums.

"We believe there is a desire on the part of many saw mill owners for the establishment of such an undertaking, as it cannot be sound or politic for them to pay extortionate premiums, or to become in all or in part their own insurers."

THE INVENTOR OF THE CIRCULAR SAW.

Referring to an article on the above subject *Timber* gives the following extract from a letter received from a Canadian correspondent:—

"Referring to the article 'The Inventor of the Circular Saw,' in the issue of *Timber* of the 19th December, I do not think Mr. Benjamin Cummings, the inventor of the circular saw, as I remember one brought from England some 63 years since, which was in use near my old place in Co. Queens, in this province, and can still be seen there. The arbor is used for an intermediate shaft, and the old saw is knocking about the shop; but I will hunt it up and take care of it, so as to fight the Yanks on it. The grinding was done across instead of as at present, circling. The old chaps ran it by a chain belt; the nut was placed on the wrong way and would yield to the strain, slacking the saw and puzzling the old chaps generally. It was discarded before I can remember, but when a lad, I recollect looking through the mill and amusing myself with it. I was born in 1819, and it was put up about 1822 or 1823; but your 'auld folk' can put the Yankee straight if they like. I do not know when circular saws came into use, but Mr Cummings, if he made the first, must have done so more than 60 years ago."

Mr. Chas. Mickle has purchased a mill site opposite the railway wharf, and has commenced to build a new mill. The size of the main building will be 40x90, two stories high, and attachment to one end of twenty feet. It will contain one circular and two shingle machines. Mr. Mickle has a stock of about 12,000,000 to cut, and in order to accomplish it it will require to run both mills to their full capacity through the season. Mr. Mickle is also building for his own use a steam tug of 40 feet keel—48 feet over all, and 11 feet beam. The contractor is Mr. Simpson who built the Kenozha.—*Banner*

NORTH HASTINGS LUMBER CAMPS.

The following letter in reference to the lumber camps in Hastings county, Ont., is published in the *Ontario* of Belleville:

DEAR SIR.—I intended when writing a few weeks ago to follow up my observations of the north country, but have been short of time. I have to add a few remarks: There is none of the older villages of our county that has shown the amount of improvement as Marmora for a few months back. It is, I suppose, the oldest village in the north, but for very many years went backward, but in the last two years has more than doubled its permenant buildings A large cloth factory, a number of fine blocks of brick stores and tasty private houses surprised me after a few months absence. The hotels are commodious and the stores well filled. Much of this, I think, is due to the enterprise of Mr. Pearce. Another feature of the importance of north Hastings is her lumber interest. Of this, from accident, I know more of the Gilmour firm, but I know that the Rathbuns, Eddys, Booth, McArthur's Brown sons and many jobbers are doing a wonderful business.

Turning to the Gilmours, I had business at their camp in Tudor a few weeks ago, and was pleasingly disappointed to find the large amount of timber still standing in that part of the county. But their most extensive operations are in Wollaston Chandos and Cardiff, although that does not by any means cover their limits west of Hastings county. Happening to be at Coehill a short time ago, and wanting to see some parties in one of the camps, I had the good fortune to meet with the superintendent, Mr. J. Nicholson, who informed me he was going the next morning to inspect the camps and kindly offered me a seat with him, and to him I owe very much both for information and the opportunity of seeing those I wished. Seated in his cutter behind a spanking team we visited four camps and travelled some miles on foot while he examined their work in the woods, and on the landing at Vaneleek, which was nearly covered for seven miles and rode between 30 and 40 miles. There again I was pleased to see large sections of standing pine and cedar timber and large quantities of cherry, birch, black ash, white ash and other timber for consumption, large quantities of which are being got out and landed on the track of the C. O. R for shipment by rail as it will not float. The Rathbun Company, however, is doing the most of that. To give your readers some idea of the magnitude of this year's drive the Gilmours alone have a million pieces, over 700,000 pieces of pine and the balance cedar. I did not learn just what the Messrs. Rathbun have, but I believe they are not far behind, and taken as a whole their timber this year is very fine. They had cut one tree alone in Cardiff that measured 9,042 feet of lumber. Their roads are the best. Nature would seem to have just fixed a pass through the hills for a road, yet they have to spend thousands in grading the roads. I was on one over seven miles long which was smoother than the streets of Belleville. Their sheboggan sleighs are monsters in that line, the runners six feet apart, the bunks eight feet long and their loads are almost incredible. The foreman reported a load the day before of nineteen standards and 42 feet, and when I tell you a standard is 20 inches beside the sleigh, you may have some idea of the load. The Gilmours this year have nineteen camps and two thousand two hundred men besides jobbers. I could not help but contrast the past with the present in board and other accommodations in camp. Thirty years ago we had but little variety in lumber camps. For breakfast, bread, cold pork and cold water; for supper cold water, pork and bread. If we wanted tea, sugar or potatoes, we were free to buy them and cook them too. But I had the pleasure of taking dinner both in Tudor and Cardiff in the dining camps. They were about the same and I took a note of the cusine at the latter. We had the best of bread—I wish some of our Belleville bakers could have seen it and—well, I won't say any more—stewed beef, boiled pork, potatoes sweet biscuit, apple pudding and pie, tea and granulated sugar; for supper we had the good bread again, butter, potatoes, two kinds of meat, apple sauce, sweet biscuits, apple pie, the best of fried cakes, and a dish they called friccasied—I don't know what it was made of, but it was rather too good, for I ate so much I was sick after—tea and sugar. The pastry was too rich for the stomach of us who are in the habit of eating the plain food of Belleville. I asked Mr. Nicholson if that was the every day fare. No, but they changed the class of pudding and pie and cake, that was all. You will ask how can lumbermen afford such board? The answer rather surprised me; said he, the actual cost per man per day was 21 cents, that included cost of material and expenses of running the camp, while in old times when men were fed on bread and pork, flour laid down $10 per barrel and pork $50, it cost about 70 cents per day. But I weary you.

Yours, etc.,

OBSERVER.

VALUE OF LINES OF EVERGREENS.

To the Editor of the Canada Lumberman.

SIR.—As spring will soon be here, will you allow me to suggest to your farming readers the importance of devoting a few days to planting windbreaks. The portions of forest retained where the country was cleared are rapidly fading away. In some parts of Ontario, indeed, it has been very difficult to preserve them as they blow down; and when this difficuty does not exist, they are largely drawn upon yearly, either for fuel or to obtain more land for the plough, so that in a few years much of the farm land in Ontario will be destitute of shelter, and will suffer all the evils which have resulted in other regions from the same cause.

The rows of deciduous trees which are being planted here and there will be very valuable: but there is not one planted, as yet, where there should be twenty. It is a subject which will very soon force itself upon the minds of our people; and there are two suggestions relative to it. The first is to begin before shelter is needed; trees take time to grow. The next is, why not grow trees which will be of use in winter, when shelter is most needed rom the wind and cold? Deciduous trees are of little use, the evergreens are much.

All through the country there are to be had, in unused fields, or the borders of woods, numbers of young evergreens—pine, spruce, or cedar. Either of these will answer—the last for the damper ground—the two first for the dry. All ground for trees, however, is the better for drainage. If quantities of these young trees were transplanted this spring, either directly into lines along the exposed sides of farms, or if very small into the garden to transplant again next spring, it would be the most paying work ever done on most farms.

The best time to transplant evergreens is the first week in June, but it can also be done very well in early spring. The most successful planting I have known was 750 trees, four feet high, transplanted when in spring, the ground had frozen again two inches deep, so that a good sized piece of earth come with each cut around. Only four were lost. Smaller trees, of course, are more easily managed. In Massachusetts, last year, I saw them, six inches high, being planted out by the thousand. As to distance apart, all will do, from a foot to six feet. Close planting is best, they can be transplanted afterwards.

I have let me say, obtained opinions and evidence on this subject from many practical men, who have watched the result of experiments of this class for many years, and have also seen many instances myself. I have no hesitation in saying that, if the country were properly sheltered by evergreen windbreaks, crossing every here and there, farm property would be worth one-fourth more for agricultural purposes than much of it is at present.

Yours, etc.,

Toronto, March 27th. R. W. PHIPPS.

THERE is a floating planing mill in the Allegheny river, at Pittsburg, 70x170 feet and two stories high, with windows and doors like any house. It is owned by J. W. Cook & Co., of Allegheny. It has been supplied with all the the necessary machinery. The same firm owns a floating saw mill. The two will be operated together.

Perhaps the most extraordinary that success has been achieved in modern science has been attained by the Dixon treatment for Catarrh Out of 2,000 patients treated during the past six months, fully ninety per cent. have been cured of this stubborn malady. This is none the less startling when it is remembered that not five per cent. of the patients presenting themselves to the regular practitioner are benefitted, while the patent medicines and other advertised cures never record a cure at all. Starting with the claim now generally believed by the most scientific men that the disease is due to the presence of living parasites in the tissues, Mr. Dixon at once adapted his cure to their extermination; this accomplished the Catarrh is practically cured, and the permanency is unquestioned, as cures effected by him four years ago are cures still. No one else has ever attempted to cure Catarrh in this manner, and no other treatment has ever cured Catarrh. The application of the remedy is simple and can be done at home, and the present season of the year is the most favorable for a speedy and permanent cure, the majority of cases being cured at one treatment. Sufferers should correspond with Messrs. A. H. DIXON & SON, 305 King street west, Toronto, Canada, and enclose a stamp for their treatise on Catarrh.—*Montreal Star* 1y122.

NOTICE.
SEALED TENDERS, addressed to the undersigned, and endorsed "Tender for Indian Supplies," will be received at this office up to noon on TUESDAY, 20th APRIL, 1886, for the delivery of Indian Supplies during the fiscal year ending 30th June, 1887, consisting of Flour, Bacon, Beef, Groceries, Ammunition, Twine Oxen, Cows, Bulls, Agricultural Implements, Tools, &c. duty paid, at various points in Manitoba and the North West Territories.
Forms of tender, giving full particulars relative to the supplies required, dates of delivery, &c, may be had by applying to the undersigned, or to the Indian Commissioner at Regina, or to the Indian Office, Winnipeg.
Parties may tender for each description of goods (or for any portion of each discription of goods) separately or for all the goods called for in the schedules.
Each tender must be accompanied by an accepted Cheque in favor of the Superintendent General of Indian Affairs on a Canadian Bank for at least five per cent of the amount of the tenders for Manitoba and the North-West Territories, which will be forfeited if the party tendering declines to enter into a contract when called upon to do so, or if he fails to complete the work contracted for. If the tender be not accepted the cheque will be returned.
Tenderers must make up in the Money columns in the Schedule the total money value of the goods they offer to supply, or their tender will not be entertained.
Each tender must in addition to the signature of the tenderer be signed by two sureties acceptable to to the Department, for the proper performance of the contract.
In all cases where transportation may be only partial by rail, contractors must make proper arrangements for supplies to be forwarded at once from railway stations to their destination in the Government Warehouse at the point of delivery.
The lowest, or any tender, not necessarily accepted.
L. VANKOUGHNET,
Deputy of the Supeintendent-General of Indian Affairs.
Department of Indian Affairs.

CRATEFUL—COMFORTING
EPP'S COCOA.
BREAKFAST.
"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately flavored beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame."—*Civil Service Gazette.*

Communications to insure insertion (if accepted) in the following number, should be in the hands of the publishers a week before the date of the next issue.

The CANADA LUMBERMAN is filed at the Offices of MESSRS SAMUEL DEACON & Co., 154 Leadenhall Street, London, England, who also receive advertisements and subscriptions for this paper.

PETERBOROUGH, Ont, APRIL 15, 1886.

DUTIES ON LUMBER AND LOGS.

THE proposal now before the United States Congress to take off the customs duty on imported lumber has been met by its opponents with the proviso that the change shall not take place in the case of any country that imposes an export duty on logs. This is evidently aimed directly at Canada, and is in pursuance of the policy of our neighbors of drawing upon our forests while conserving their own. Recently they have made large purchases of timber limits in Ontario with the design of taking logs thence to their own mills, and therefore they are more urgent than before to be unimpeded by an export duty.

From this proposal in Congress we may learn the lesson that we would do well to maintain our export duties on saw logs, or even to increase them. Those who attach great importance to the removal of the United States import duty on our lumber, may readily see for themselves that they are more likely to obtain this change if we maintain the leverage afforded by our export duty on logs. If we freely give them what they require they will assuredly be less willing to meet our views, which we can only hope to obtain by having something to offer in exchange.

There are, however, many who think it would be even more beneficial to retain the export duty on logs than to obtain the placing of our lumber on the free list. They object to see logs taken out of the country by foreign mill owners when we might have the profit of converting them into lumber at our own saw mills. On the other hand they doubt whether the remission of the duty on lumber might not be partially offset by a reduction in the price.

Whichever of these views is taken the natural conclusion is that it would be a very unwise policy to allow our logs to be exported without paying duty, at all events unless we secure some adequate compensation for yielding this privilege. The export duty should therefore be maintained, increased and enforced. It should indeed be increased to $2.00 a thousand so as to counterbalance the duty charged by the United States on our lumber.

It is said that already the payment of the duty is evaded as to many logs that are exported. From the extensive purchases of limits that have recently been made by our neighbors there is every likelihood that this practice of evading the duty will become more prevalent unless due precautions are taken. Some, indeed, argue that it would be impossible to collect the duty with such a long shore line, combined with close proximity to the international boundary. We cannot, however, see the force of this objection. Vigilant officers could make attempts at smuggling so hazardous and costly as to cause them to be abandoned as unprofitable, and surely our legislators could devise provisions that would make the vessels, the timber limits and other valuable property involved in such practices responsible for dishonest infractions of our laws. A few seizures and forfeitures would frighten all but the most reckless from a continuance of such illegal and fraudulent practices.

A RIVER DRIVING BILL.

ALTHOUGH the bill introduced by Mr. Murray, M. P. P., for North Renfrew, during the last session of the Ontario Legislature, was dropped by the special committee to whom it was referred, yet as it was generally conceded that some legislation in the same direction was desirable and that the matter would again be brought before the Legislature at its next session, we deem it advisable to place the bill as introduced by Mr. Murray before our readers in order that the trade may become fully informed as to the kind of legislation which some of their number are endeavoring to have placed on the statute book.

As the importance of such legislation can scarcely be overrated, and as too much legislation is passed in a hasty and undue manner at Toronto, we think it would be well for those directly interested to place their views before the public, through the columns of the LUMBERMAN, so that if a measure of this kind is passed it will be in the general interest, and not for the benefit of a few at the expense of the many —as some apprehended this one would have proved had it been passed in the shape in which it was introduced.

The following is the bill:

1. Any person putting or causing to be put into any lake, river, creek or stream, in this Province, any saw log or other timber for the purpose of floating the same to the place of manufacture or market shall make adequate provisions, and put on a *sufficient* force of men to break jams of such saw logs, or other timber in or upon such lake, river, creek or stream, and to run or clear the same from the banks or shores thereof, and to run or drive the same so as not to hinder the removal of any saw logs or other timber from the banks or shores thereof; nor obstruct the floating or navigation of such lake, river, creek or stream.

2. In case of the neglect of such person to make such adequate provision, and put on such sufficient force of men, as aforesaid, it shall be lawful for any other person engaged in floating or running saw logs or other timber in such lake, river, creek or stream, obstructed by reason of such neglect, to cause such jams to be broken, and such saw logs and other timber to be run, driven or cleared from the banks of such lake, river, creek or stream, at the cost and expense of the person owning such logs or other timber, and such owner shall be liable to such person for such cost and expenses.

3. The person so causing such jams to be broken, or such saw logs or other timber to be run, driven, or cleared, shall have a lien on such saw logs and other timber, for his reasonable charges and expenses for breaking jams, and for running, driving and clearing the same, and shall be entitled to take and retain possession of such saw logs or other timber, wherever the same may be found, or so much thereof as may be necessary to satisfy the amount of such charges and expenses, and all costs, and may after 30 days' notice to the owner, if the owner be known, and advertisement thereof for three successive weeks, at least one in each week, in a newspaper published nearest to where such saw logs or other timber may then be, sell by public auction, subject to the lien of the Crown, if any, for dues, the said saw logs or other timber, or so much thereof as may be necessary to satisfy the amount of charges and expenses, and all costs, rendering the surplus on demand to the owner.

4. If the owner of the saw logs or other timber is not known to the person claiming the lien, then such person may after advertisment thereof for four successive weeks, at least once in each week, in the *Ontario Gazette*, and in a newspaper published nearest to where such saw logs or other timber may then be, sell by public auction the said saw logs or other timber or so much thereof as may be necessary to satisfy the amount of such charges and expenses and all costs.

5. Any person whose saw logs and other timber in any lake, river, creek or steam, in this Province, are so intermixed with the saw logs or timber of another person, that the same cannot be conveniently separated for the purpose of being driven or floated to market, or place of manufacture, may drive all saw logs and other timber with which his own are so intermixed at the cost and expense of the person owning the same, unless such owner furnish a fair proportion of plant and men, and do or cause to be done a fair proportion of the work necessary to be done in driving all the said logs and other timber, so intermixed, and such owner shall, unless he so furnish a fair proportion of the work in driving said saw logs and other timber as aforesaid, be liable to such persons for such costs and expenses, and such person shall have a lien on such saw logs and other timber for his reasonable costs and expenses for driving the same, and shall be entitled to take and retain possession of such saw logs or other timber, wherever the same may be found, or so much thereof as may be necessary to satisfy the amount of such charges and expenses and all costs, and may sell the said saw logs and other timber in the manner mentioned in the sections hereinbefore mentioned, but subject to the provisions as to notice and advertisement thereof as in said sections mentioned.

6. If the owner of the said saw logs or other timber shall disput the amount claimed by a lien holder he shall, within five days from the receipt of the notice of sale, to be given by such lien holder to such owner, give notice in writing to such lien holder, that he disputes the amount claimed and thereupon the following proceedings shall be had unless the parties otherwise agree upon the amount to be paid:

1. Such notice shall state the name of an arbitrator and call upon the lien holder to appoint an arbitrator on his behalf within five days after service of such notice, and in default of such lien holder making such appointment it shall be lawful for the Judge of the County Court of the county, or the Stipendiary Magistrate of the Judicial District, as the case may be, in which such saw logs or other timber are situate, upon request of the owner to appoint such abitrator, and the two arbitrators so appointed shall forthwith appoint a third arbitrator in the matter;

2. If after the arbitrators have been appointed, as aforesaid, they fail or neglect for the space of five days to appoint a third arbitrator, the said Judge of the County Court or Stipendiary Magistrate shall, within four days after a request in writing made upon him by either of the two arbitrators appointed as as above, appoint a third arbitrator;

3. The arbitrators may require the personal attendance and examination on oath of the parties and their witnesses and the production of all documents relative to the dispute, and may determine by whom the expenses of the arbitration shall be defrayed, together with the amount thereof, and shall make and deliver their award and determination within twenty days from the date of their appointment, and the said lien holder may retain his lien and possession of the said saw logs and other timber until such award is made and delivered, and the amount found thereby and costs is paid by such owner to such lien holder.

7. If the owner does not forthwith pay the amount and costs which the arbitrators determine that he shall pay, such lien holder may proceed to sell by public auction the said saw logs, or other timber, or a sufficient portion thereof, to satisfy the award and costs, and the subsequent costs incurred by such sale, first giving notice of such sale by advertisement for two successive weeks, at least once in each week, in a newspaper published nearest to where such saw logs or other timber may then be.

8. Any person whose saw logs or other timber are intermixed in any lake, river, creek, or stream, with the saw logs or timber of any other person, and who for any reason desires to separate the same, or does not wish to continue the drive, shall at his own cost and expense separate his said saw logs and timber from the saw logs and timber of such other person, and securely boom the same to one side, in such manner as to allow a free passage for the saw logs and timber of any other person who may wish to continue the drive.

OUR CROWN DOMAIN.

THE following facts and figures with regard to the crown domain of Ontario for the year 1885 are taken from the annual report of the Commissioner of Crown Lands:—

The total receipts of the Department for the 12 months were $736,864.95, made up as follows:

LAND COLLECTIONS.

Crown Lands	$ 85,285 99
Clergy do.	9,403 23
Common school lands	18,981 58
Grammer do. do.	1,578 59
Rent	1,166 00
In suspense	10,000 00
Total on land account	$126,415 95

WOODS AND FORESTS.

Timber dues	$412,738 99
Ground rent	41,182 44
Bonus	151,402 70
In suspense	15 22
Total	$604,339 35

In this sum, however, is included the sum of $148,558 received on account of the special sale of limits held last October, leaving the actual ordinary revenue of the year but $455,781.

The only other receipts besides these two were $1,004 for casual and surveyors fees, and $5,105 for refunds on various accounts.

On the other hand the expenditure of this Department, besides the $36,350, which the Crown Land office in Toronto costs annually, footed up $242,787.55, made up as follows:—

Land agents salaries	$ 9,796 00
Timber agents salaries	8,290 00
Agents disbursements	1,529 37
Miscellaneous	268 85
Wood ranging and inspection of timber lands	20,170 86
Forest fire protection	7,911 00
Refunds	8,798 88
Colonization roads	121,435 32
Surveys	48,227 00
Contingencies	13,483 81
Two per cent. on timber cut on road allowances paid to municipalities	2,406 46
Board of surveyors	380 00
Total	$242,787 55

The total number of acres sold during the year was 102,826, for $92,092, or a little less than 90 cents per acre.

Of the $29,963.40 received on account of clergy, common school and grammar school lands, $14,385.70, or nearly one-half, was for interest on the original purchase money. The sales of lands belonging to these three trust funds during the year was but 2,908 acres for $3,075.

The number of persons located on free grants during the year was 1,296, who took up 176,351 acres as free grants, and 149 of these purchased 5,998 acres besides. The number of locations cancelled during the year was 563, and the number of patents issued but 581.

The number of persons located on free grants by each agent was as follows:—

T. C. Taylor, Bracebridge	160
Mrs. T. McKay, Parry Sound	81

S. G. Best, Maganetawan	152
E. Handy, Elmdale (Parry Sound)	115
J. S. Scarlett, Nipissing	145
Wm. Fielding, Minden	41
D. Anderson, Apsley	34
C. R. Stewart, Haliburton	17
J. R. Tait, L'Amable	98
G. W. Dawson, Pleona	68
Jas. Reeves, Eganville	65
John Whelan, Brudwell	87
J. D. Kennedy, Pembroke	34
B. J. Gilligan, Mattawan	71
C. P. Brown, Sault St. Marie	9
J. F. Day, Bruce Mines	3
A. G. Duncan, Marksville	30
Amos. Wright, Port Arthur	26
J. D. Cockburn, Nipissing district	0
A. Kennedy, Renfrew	0
R. Macpherson, Frontenac	0
W. L. Nichols, Algoma	0
Total	1,236
Number of agencies	22
Cost of agencies	$10,293

The woods and forest revenue of $455,781 for the year was drawn from the three districts into which the Province is divided as follows:—

From the Ottawa district $187,114; from the Belleville district $80,716; from the Western district $187,949. The amount derived from the auction sale was, of course, all obtained from the western district.

The area under license was:—

	SQR. MILES.
Ottawa district	6,503½
Belleville district	1,537½
Western district	9,174
Total	17,215

Or equal to 11,017,600 acres.

The quantity of white pine saw logs cut on the Crown domain, in 1885, was:—Ottawa district, 1,886,536 pieces, measuring 1,201,565 standards of 200 feet board measure; Belleville district, 1,099,277 pieces, measuring 537,912 standards, and western district 975,987 pieces, measuring 608,530 standards; total, 3,961,857 pieces, measuring 2,348,007 standards, average measurement per log 118 feet board measure. Average of Ottawa district 127 feet; Belleville district 98 feet, and of the western district 124 feet. The total quantity of "other" saw logs cut was 44,354 pieces, measuring 18,153 standards.

Of square timber the total make of white pine was 59,758 pieces, measuring 3,164,866 feet, and of which 24,566 pieces was made in the Ottawa district; 10,686 in the Belleville district, and 24,506 in the western, while that of red pine was 489 pieces, measuring 23,427 feet.

Of boom and dimension timber the total make was 139,240, equalling 149,611 standard logs.

The output in the whole Province of the undermentioned woods was as follows:—

	PIECES.	FEET.
Elm	252	10,617
Ash	710	26,655
Maple	9	241
Oak	9	519
Tamarac	59	1,963
Birch	7	276
Hemlock	963	39,620

The cut of railway ties was 43,707 in the Ottawa district; 33,440 in the Belleville district, and 930,246 in the western, or a grand total of 1,015,393 ties.

Of other woods there were got out: 1,611 cords of hard and 23,036 of softwood, 6,808 telegraph poles, 280 traverses, 215,523 lineal feet of cedar, 943 cedar posts, 3,127 cords of bolts, 1,695 spiles and 559,296 feet of bridge timber.

The total amount of trespass dues accruing during the year was but $4,987.

Why will you suffer when 25 cents will buy a bottle of West's Pain King and one dose will cure the worst case of colic or cramps and a few doses will cure summer complaint, dysentery, diarrhœa or flux. Go to J. D. Tully's and purchase a bottle without delay.

Chips.

THE *Banner* says Mr. Isaca Cockburn's cut of timber this season is 6,000,000 feet in addition to 100,000 feet of square timber.

GREECE is not commonly supposed to be a timbered country, yet a recent official report show that a ninth part of its area is forest land.

THE Minister of Education has set apart Friday, 7th of May, as "Arbor Day." On this day teachers, students, trustees and ratepayers, should join in planting trees.

THE amount expended by the Crown Lands Department of Ontario for Fire Ranging in 1886 was $7,911. The amount proposed to be expended in 1886 is $8,000.

A YOUNG man named Wm. Gainer, of Minden, Ont., was caught by the top of a tree he had cut down, and buried in the snow. His brother came to his rescue after a time and dug him out. He was not very seriously injured.

THE Lumber Exchange Bank has been organized, at Tonawanda, N. Y., with a paid up capital of $100,000. The officers are, Edward Evans, president; Joshua A. Bliss, vice-president, and James H. Rand, cashier.

THE New York Superintendent of Public Works has sent requests to all officials along the State canals to arrange for the opening of the canals at the earliest period practicable for the public benefit—if possible by April 25.

A MAN nammed Bennett, of Walla Walla, W. T., lately received 18,000 locust and box elder to set out on his farm in that vicinity. Isaac Chapman has also bought the same number of trees to plant on his ranch in the same vicinity.

AT Eganville, on April 8th, Edward Jessup, employed at the saw mill of Mr. J. D. McRae, got his left hand caught between to cog wheels and all the fingers and about half the palm was taken off. The thumb can be saved.

AN Ottawa despatch says that Messrs. Sherman, Lord & Hurdman have purchased from Messrs. J. & G. Bryen, of Port Cologne, timber limits on the River Kippewa. The firm proposes extending this business very largely this year.

THE Lieutenant-Governor of the Northwest Territories has set apart Saturday, May 1st, as "Arbor Day," and the people of the Territories are earnestly invited to set aside all other occupation on that day and go heartily into forest and other tree planting.

A LOCAL paper says that the Government tug *Bayfield* is having her upper works rebuilt, preparatory to her summer's work of exploring the Georgian Bay. Last summer she did some very useful work in locating hidden rocks and placing their position on the chart.

B. F. CRAIG, senior member of B. F. Craig & Co., Corning, Ark., has sold his interest in the firm's mill and lumber business to A. M. Edgar, of Edgarsville, Ont. Mr. Craig retires after having built a fine mill, and miles of standard gauge railroad, and established a good business.

THE Calgary, N. W. T., *Tribune* says:—Mr. S. J. Hogg went up to Cochrane on Sunday last, returning on Wednesday. He visited the timber limits of the Calgary Lumber Co., which embrace an area of about 8 miles square, and found a better range of timber than he had seen any other place east of the Columbia. The compay have their tramway to their mills about completed, and intend to commence operations at once, expecting to be able to turn lumber into the market in about a month. The timber is of the Cypress variety, and comparatively clear. The saw mill is fitted up with all the modern equipment, and is now in perfect working order.

IN the vicinity of Keene, N. H., there are 40 pail and tub lathes. Each lathe turns out an average of 100,000 pails a year, consuming 450 cords of sapling pine, giving a product of 4,000,000 pails to 18,000 cords of timber. The 20 tub and bucket lathes use a large quantity, and many staves are sold out of the district. It is probable that 40,000 cords of sapling pine is consumed in this industry.

THE lumber merchants of the Chaudiere, says the *Ottawa Free Press*, are quite jubilant at the prosperous outlook for their trade during the coming season. At present the mills are only waiting for the ice to break up, to start work. Several shantymen and others who have been lumbering during the winter are already making their appearance, so as to be in readiness for the opening of the mills. It is generally reported that the season's output of logs will be very large, and in some instances has even exceeded the expectations of the lumber merchants.

THE Orillia *Packet* says:—The second log which was to have been cut in Mr. Tait's mill this spring caused a serious break down. In canting it on to the carriage an unlucky inequality and the enormous weight of the stick combined, proved too much for some of the castings, and although rhe shingle department was kept running, the rest of the mill had to be shut down for a few days. The log in question very much resembled those of Californian fame, and must have been an older resident than M. Quinn himself.

THE MORRISON BILL.

The *Lumberman's Gazette* says:—"The Canadian journals have stated that the Morrison tariff bill does not propose to put manufactured lumber—that is pine timber cut into boards, etc., such as are manufactured at the Ottawa and other Canadian mills—upon the free list, but the bill only covers the various kinds of wood used in the manufacture of furniture. One of these clippings we sent to the Hon. Wm. C. Maybury, M. C., at Washington, with an inquiry as to the correctness of the statement of the Canadian journal. Mr. Maybury kindly replies that the Canadian journal is wholly mistaken. The intention of the tariff bill is to admit pine timber (lumber) free of duty, with a proviso against an export tax on the part of the Dominion Government. The *Gazette* did not misunderstand the intention of the bill, but thought it would be well to fortify its opinion by the statement of a member of the committee of ways and means. Mr. Maybury's views are too pronounced to lead us to believe that he would countenance a bill that was a mere jugglery of words and did not fairly and squarely knock out the Michigan manfacturers of lumber by admitting the Canadian manufacture into the United States free of duty."

RE-SURFACING WOODEN PAVEMENTS.

Some interesting experiments have be lately made with a view to cutting and re-surfacing the London wood pavements that are already raid to have become uneven through excessive wear or other causes. The machine for the purpose is the invention of Arthur C. Bicknell, Chester; in appearance it is not unlike an ordinary traction engine, propelling itself and carrying in front of it a large revolving horizontal head fitted with cutters and driven by friction gearing. The experiments have been carried out in Manchester; a number of old wooden blocks that had been taken up from a worn-out, road, and were full of stones and grit, were obtained, and were relaid in concrete and fitted in wirh cement and sand, the usual method of making a road. A week was then allowed for the cement to thoroughly set before the cutting head was applied, the surface was then taken off, the cuts varying from one-half to three inches in depth; the deeper the cut the better the machine appeared to work, the cutters getting below the grit and and stones on the surface. The speed at which the cutting head advanced was about one foot a minute. It is expected that further experiments will come into general use, thus making locomotion more agreeable, prolonging the life of our roads and lessening the vexatious stoppage and delay to traffic that so frequently occurs when roads that are really only half worn out have to be taken up and entirely relaid.—*London Engineers.*

AMONG the appropriations made for the improvement of streams, for the driving of timber, during the recent session of the Ontario Government, was one for $2,750 to meet one-half the cost of reconsturcting dam across Burnt river at Kinmount.

THE Ontario Government proposes to expend $20,000 in erecting barns, stables, farm offices, carpenter's shop, blacksmith's shop, implement shed and experimental diary, during the present season to replace the buildings burned at the Model Farm at Guelph last year.

A SUBSCRIBER writes that the season's cut of Messrs. Scott, Scott & Co. (successors of the Medonte Lumber Company, Hillsdale) will exceed 4,000,000.

If you are afflicted with rheumatism call on J. D. Tully, druggist, immediately and procure a bottle of West's World's Wonder or Family Liniment, it is a certain and positive cure. It is infallible for sprains, cuts, bruises, burns, scalds and all diseases requiring external application. Price, 25 and 50 cents per bottle. Sold by J. D. Tully, druggist.

It is a fact that can be verified everywhere that West's Cough Syrup is the only compound known to science, that can eradicate the seeds of consumption in its early stages, and completely cure Coughs, Colds, Asthma, Bronchitis and all Throat and Lung difficulties. Sold by J. D. Tully, druggist. Price 25 cents, and 50 cts and $1.00 per bottle.

FOR SALE
VALUABLE
Timber Limits
AND
50,000 SAW LOGS
ON SEVERN RIVER

The undersigned being desirous of confining their operations to their Lakefield Mills on the Trent waters, offer for sale the following limits:—

Township of Hindou, 70 square miles.
" Oakley, 45 " "
" Redout, 22 " "
An area of 137 square miles.

These limits are estimated to contain 180 million feet of Logs, well watered, and afford means of short hauling from all points, and quick and cheap driving to Georgian Bay. Are offered for sale together with plant, depots, farms, 1,200 acres deeded lands and 50,000 logs, nearly all of which are on the main river, a large proportion of which are 16 feet long. Apply to

R. & G. Strickland,
3mL LAKEFIELD, ONT.

Chips.

McCURNEY & Co. have three million feet of logs boomed on Lake Joseph, Ont.

THERE are 17,000,000 feet of logs in the North river, Lovering, Ont., which is greater than at any previous season.

MAXON & Co., at Au Gres, Arenac county, Mich., recently finished a hoop mill, and will turn out 10,000 a day.

THE talk is that the Menominee river drivers will this spring be paid $2.50 a day, an advance over last year's wages of 50 cents to $1 a day.

DON. J. LEATHERS, of Grand Rapids, Ira O. Smith, of Muskegon, and J. H. Swan, of Chicago, have been prospecting in Minnesota for a tract of 125,000,000 feet of pine.

NOYES BROTHERS and John Saxton recently sold Merrick & Murphy, of Menominee, Mich., 130,000,000 feet of logs in the vicinity of Florence, Wis, for $7 a thousand. John W. Molloy sold 250,000 feet of logs for $8 a thousand.

J. T. HURST, of Wyandotte, Mich., is reported to have sold to West Bay City parties a tract of pine, estimated to cut 8,000,000 feet, situated on the Mackinaw division of the Michigan Central railroad, at a consideration of $40,000.

THE Bow River Lumber Company, the concern composed of Eau Claire, Wis., men, that bought timber lands on Bow river, Alberta, in the British Northwest, has concluded to build a mill in that region, with 50,000 or 60,000 daily capacity.

THE annual report of the Board of Trade, of Toronto, states the exports of the forest products from that port for 1885 to have been valued at $256,139. The principal item was 19,398,000 feet of plank, boards and joists, valued at $245,183.

HUNTRESS & BROWN, of Duluth, have bought the Gibbs & Mallett tract of pine, in the vicinity of Beaver bay, north shore of Lake Superior, 60 miles from Duluth. The price was $1.50 a thousand stumpage. The pine is estimated at 40,000,000 feet.

WM. WOODBARRY, a lad 17 years of age, had one of his hands taken off by a circular saw in Atcheson's wood-working shop in Toronto on April 5th. The wounded boy was taken to the general hospital, where the injured member was attended to.

IT is reported that a party of capitalists have bought all the white oak timber on the bottom lands of Tallahatchie river, Miss, from Tippah down to Wyatt, and work has already been begun in converting the timber into pipe staves for the European market.

EXPORTS of lumber and coal from Puget Sound ports, B. C., are growing. The lumber exports for February were 16 608,000 feet valued at $200,000; the coal exported aggregated 20,890 tons, valued at $117,000. Steamships carried away oats, wheat and other produce, valued at $50,000.

THE institution of Arbor Day was a new departure in Ontario schools last year. It seems to have been as successful as could reasonably be expected the first year. The total number of trees planted was 30,648 in 38 counties, Simcoe heading the list with 3,560, Wentworth coming next with 2,700, and Middlesex next with 2,100. All the others planted less than 2,000, the metropolitan county of York having only a petty 1,200 to show.

A DESPATCH from Ottawa says that it is expected that a larger number of men than usual will be employed this season in the Chaudiere lumber mills. The outlook on every side is regarded with satisfaction, and a demand for lumber from several new centres is expected. The cut, it is also believed, will be in the neighborhood of 300,000,000 feet. Prices are somewhat firmer and a further improvement is confidently expected.

THE tolls from lumber on the Ottawa and Chambly Canals are less by $7,000 than during the previous year, which is attributed to the shipments by the Canada Atlantic Railway. And to the slides and booms, the accrued revenue from which is less than that of the previous year by 42 per cent. Mr Miall says: "Three causes have contributed to this result: 1st. The quantity of timber cut was less than the previous year; 2nd. The quantity of square timber carried by rail was greater; and 3rd. There is an increasing disposition to locate the mills nearer to the timber limits, and to transport the sawed lumber by rail."

NEW BRUNSWICK lumbermen complain that that the stumpage dues are excessive; and, says the *Monetary Times*, the fact that the receipts from them showed a decrease of $24,000 last year, would seem to show that they are not exceptionally productive. But the reply of the Government to a deputation of lumberers which asked for a reduction, was that the Government could not spare the revenue, and there the matter ends for the present. The lumber trade of the Province can ill afford to bear exceptional burthens; and if the experience of another year of this charge be unfavorable, perhaps the Government may, by that time, find some way out of the difficulty.

ART OF WOOD CARVING.

It is quite impossible to say in what century wood carving was originated, but there is no doubt it is a very ancient art, having been practised in Assyria, Babylon, Egypt and Greece from the earliest times of which we have any record. About the year 1491 B. C. it is said that one Bezaleel, of the tribe of Judah was specially selected for his skill as a workman in gold, silver, brass, gem cutting and setting and carving in wood, to execute the work upon the tabernacle and its furniture. The Egyptians were justly renowned for their skill in carving, as is abundantly shown by their chairs, biers, couches, arms, chariots, etc. It is recorded that the ornamentation of the Temple of Solomon and its furniture about 1005 B. C. was beautifully executed, the doors being of olivewood, and on them were carved "cherubim and palm trees, and open flowers." The carving was overlaid with gold. Other doors were of fir similarly carved.

BEFORE PARLIAMENT.

In the Private Bills Committee, at Ottawa, Mr. Wright's bill to incorporate Messrs. E. B Eddy, G. H. Millen and S. S. Cushman, of Hull; and R. R. Dobell and Thos Beckett, of Quebec, and others, as the E. B. Eddy Manufacturing Company, with power to carry on the business of lumberers, lumber merchants, manufacturers of matches, sashes, doors, woodenware of all kinds, packing boxes and packing box shooks, wood pulp and pulp from any other material, end all kinds of pulp and paperware or chemicals, and timber and lumber in all its branches, and also the business of general merchants, manufacturers, forwarders, common carriers, wharfingers, warehousemen and ship and vessel owners, was passed with amendments.

Mr Sutherland's (Oxford) Bill to grant certain powers to the Sable and Spanish Boom and Slide Company, Algoma, was passed with amendments.

OILING WOOD.

Waggon makers or repairers can save their stock from worms by oiling with linseed oil. Singletrees, doubletrees, neck-yokes, spokes and cross-bars that are of white hickory and are kept in stock for a year or more will be eaten by worms if not kept in a dark place or otherwise protected. Coal and korsene oil are good also, and the expense of applying is but little. Linseed oil is preferable, as it acts to some extent as a wood filler, filling the pores and thus aiding the painting which follows in its proper place. A boy can take a rag dipped in the oil and go over a large number of pieces in a day's time, or a vat can used long enough to admit of several dozen at a time, and put where they can drip for one or two minutes. The expense of this is much less than those who have not had the experience might imagine, and far less than the loss of stock by worms. Some manufacturers oil all their white hickory stock before shipping.—*Ex.*

THE FURNITURE WOOD MARKET.

Lumber dealers say that retail dealers and consumers generally are rapidly comprehending the fact that all the mechanical part of furniture manufacture can be done as cheaply upon mahogany and rosewood as upon cherry or maple, and the finishing with probably less cost, since artistic staining is not necessary, and are beginning to demand that add tional cost of lumber alone shall enter into the calculation of the advance in price. Manufacturers are said to be rapidly seeing the justice of conceding as much, and the consumer is no longer so easily balked in his hunt after articles in the precious woods. Already the trade in mahogany lumber has felt the impetus of this, and dealers in this wood state there is now more mahogany, baywood and rosewood sold to manufacturers of furniture than in any preceding period, and they say that consumers already seem adepts in figuring the addition that is just in the price of a mahogany over a cherry or walnut suit, whether parlour or bedroom and the more precious woods seem upon the eve of assuming the place they occupied of old in the estimation of the public. Cherry is said by lumber dealers in the city to have long held a place of prominence, partly on account of being a hard and durable wood, easy to manipulate, but chiefly because it is so easily stained to imitate more precious woods. They say walnut has a field of its own, but the same reason of substitution no doubt contributed to its long held popularity. They declare that cherry, which has been so nearly entirely esteemed for its imitative qualities, must, under the broad light of the plentitude of mahogany, rosewood and ebony, lapse to the place in the catagory of lumber to which it properly belongs. *Carpenter and Builder.*

B. C. LUMBER INDUSTRIES.

The Vancouver *Herald*, in giving a sketch of Voncouver, says:—

The lumber resources of British Columbia are very great. A dense forest of giant firs and Douglas pine lines the coast and reaches far up into the mountains, a source of wealth upon which the people may draw for generations to come. The Douglas pine is the most abundant and possesses the greatest commercial value. It covers the coast and islands in great dense forests extending as far north as the Skeena river. It grows to gigantic proportions and straight as an arrow. For shipbuilding it is specially adapted, and its great length and toughness make it peculiarly adapted for masts and spars. The seat of the greatest lumbering industry in the Province is Burrard Inlet, and one of these mills, the Hastings saw mill is on the site of the city of Vancouver, the other is directly opposite on the north shore of the Inlet and known as Moodyville saw mill.

The Hastings Saw Mill Company, cuts about 20,000,000 feet of lumber annually, and the Moodyville Co. nearly 25,000 000. It is shipped to South America, Honolulu, China, and Australia, while spars and masts are sent to Europe. This industry might be developed to immense proportions and never be without a market.

Building materials are cheap. The price of the several classes of lumber are as follows:—Rough lumber, $12.00 per thousand feet; rustic, 2d class, $15 to $17; do., 1st class, $20 to $22.50; finishing lumber $22.50 to $25; laths and shingles, $2.50 per 1,000; bricks, from $8 to $10 per 1,000; lime from 50c. to 70c. per bushel

Vancouver will become the capital of the Province, and probably the commercial capital of the Pacific coast of this continent. It is the terminus of the great Canadian Pacific railway, and is one of the transhipping points of the world. It will become the centre of all industries and the distributing point of all manufactures, produce and imports of Canada, and a large portion of America, by the close connections it will have with India, China, Japan, Australia, South America and the Pacific islands by steamship lines.

With such a connection in commerce Vancouver cannot fail to become one of the great cities of the world—a London, a New York, a Liverpool or a Glasgow. May we add one word more—let the council have this greatness always before their eyes and mar it not by that loathsome thing that has done so much to spoil the beauty of other cities on the Pacific. We have exaggerated nothing, and will leave it to those who come to visit us to judge, and the result of their judgment will be their becoming permanent citizens in this the foundation of a future great city.

AN IMPORTANT LUMBER CASE.

In this important case, in which Mr. Donald Guthrie, Q C, of Guelph, and the other defendants were charged with misrepresenting the business which the company was formed to take over in order to induce subscriptions for stock, the Supreme Court of Canada recently gave a unanimous judgment, affirming the judgment of the Court of Appeal and of Mr. Justice Ferguson in favor of the defendants, dismissing the action. Mr. Justice Gwynne wrote the principal opinion, and the concluding sentence of it was as follows:—

"Now, having read with the greatest care every particle of the evidence, and having given the best consideration I could to the argument of the learned counsel for the appellants, as delivered orally before us; and as expanded at large in his printed factum, I feel compelled to say that in my opinion the defendants are not only free from any just imputation of the gross fraud with which they are charged in the statement of claim, but they are equally free from any reckless disregard of the truth or falsity of the statements made in the prospectus, and that they prepared that document with an honest intention of fairly representing according to their knowledge the condition of the business for the taking over of which the company was proposed to be incorporated, and that they *bona fide* believed to be true every statement made in the prospectus, both as to the condition of the business in which they were engaged and as to the prospects of the proposed company, of which, I think, they have given in addition to their evidence upon oak in the cause the strongest possible proof by having taken among themselves $40,000, or more than 50 per cent. of the preference stock issued by the company. And I cannot but add that the fact that the plaintiffs in these suits voted for the defendants as directors of the company after they had made the investigation in which they acquired all the information upon which they based these actions and caused them to be brought, seems to my mind to show that the plaintiffs themselves did not believe the defendants to be guilty of the frauds now imputed to them, the charges as to many of which, as appears by the examinations of the plaintiffs, seem to owe their origin to the zeal of the pleader who prepared to statement of claim rather than to the plaintiffs or any information derived from them."

THEY MADE A SALE.

As it comes to the ear of the *Lumberman* there was a very amusing transaction in maple flooring in this city not long ago. Such flooring is now sold for about $28 a thousand, which, considering the value of strips, and the planing mill charge of manufacturing them into flooring is a low price. The salesman of a concern doing a large maple business got a customer in tow and offered him flooring for $27. Immediately after this offer had been made a member of the same concern came around who was informed by the gentleman who wanted to buy that he had been offered flooring at $27.

"Oh, they are cutting prices, are they?" said the member of firm. "If that's what they are up to I'll give it for $26."

The gentleman said he would consider the proposition. The salesman soon called again and his customer told him of the $26 offer.

"They think they are smart, don't they. If that's the way they are going for us I'll make it $25 50. We'll see what kind of stuff there is in them anyway," said the salesman.

Following his lead the junior member of the firm called around again, and was told by the gentleman who wanted to buy that if he desired to sell the stuff it would be necessary for him to go a little lower as it had been offered at $1 50 a thousand less than the price he last named.

"It has. Well, to settle it, we'll give you that flooring for $24 50."

"It's a bargain," the gentleman replied. "I'll take it."

When the member of the firm returned to the office he booked the order. "I sold this flooring almighty cheap." he said to his salesman, but I'll let them fellows know that we can sell flooring as cheap as the best of them." And he smiled triumphantly as he stuck a cigar between his teeth and lit a match.

The salesman stepped to the book and looked at the name of the gentleman to whom the flooring was to go in blank astonishment.

"And have you been bidding for that man's trade?" he asked.

"You bet I have!"

"And so have I," said the salesman.

Then they struck an attitude, and looked at each other after the manner of two dromios.

The member of the firm turned around, elevated the tails of his Prince Albert, and said, 'Kick me!"

The salesman turned his back to the member of the firm, and pulled his short sack coat close around the small of his back, and echoed, "Kick me!"—*Northwestern Lumberman.*

THE STATE OF TRADE.

Private reports from various lumber centres to the *Lumber World* are given below:

GRAND RAPIDS, Mich.—Lumbermen here post no changes in prices. They profess to be cheerful over the outlook.

PITTSBURGH, Pa.—No changes in prices are published. The conditions reported last month are about the same.

MILL SPRINGS, Mo.—No prices have been changed. On account of the railroad strikes business has been suspended.

OSWEGO, N. Y.—Quotations are unchanged and the business outlook has not materially altered since last month's report.

BOSTON, Mass.—Some changes in the price of spruce and lath, an increase in both cases are posted. Business is promising.

MUSCATINE, Iowa.—The list of prices remains unchanged and the business conditions show no alteration since last month's report.

CHICAGO, Ill.—Cooper stocks remain about the same as last month. Business is moderate and better things are hoped for the spring trade.

ST. LOUIS, Mo.—There is nothing to note in the way of changes at this time. Conditions same as reported last month. The bad influence of the strikes is being felt.

TOLEDO, Ohio.—Prices remain about the same. Trade is increasing slightly but the uneasiness caused by the strikes in the southwest is being felt by all consumers.

NEW YORK CITY.—Steadiness and cheerfulness characterize this market. Immense building operations promise well for our trade. The manufacturers of wood finishings are busy. The spring trade will open brisk.

NASHVILLE, Tenn.—No special changes are noted. Prices are firm, dry stocks scarce and orders numerous. The Nashville Lumber Co have sixty days work ahead and are putting in a band saw to be ready for operation April 15th.

BAY CITY, Mich.—The list of prices show few changes and the business outlook is the same as last month. Logging estimates have not been realized. Unfavorable weather is said to have materially reduced the intended cut. Dealers are hoping much from the season about to open.

MILWAUKEE, Wis.—Few changes in prices are recorded except in flooring, dry common boards, timber, joists and scantling. The southern strikes have had a bad influence on trade, as they have tended to diminish demand. Quite an extended movement has now set in and prices are firmer as dry stocks are reduced. The prospects are more encouraging than at any time heretofore.

THE LUMBER OUTLOOK.

Owing to the absence in Europe of the senior member of the firm of E. B. Eddy & Co., the gentleman interviewed at Hull was not disposed to make any statement. The cut, however, is calculated to exceed 50,000,000 feet. The party interviewed was not inclined to gush over the situation, unlike many of those engaged in the industry across the river. He thought that the activity which has given the market such an appearance of strength has been thoroughly speculative. He also as firmly asserted that there was nothing in the outlook to warrant the activity reigning just now.

All the Chaudiere lumbermen speak highly of the project to extend the Canada Atlantic tracks into the lumber yards. They claim that it will result in more benefit to the city than any scheme adopted during the past ten years.

A member of the firm of Grier & Co. ridiculed the idea of the lumber supply running short in the near future, in consequence of the continued encroachments of the lumbermen in every direction. He said that there was still an inexhaustible stretch of pine extending that had not yet been reached while the areas cut upon years ago can be visited again in the course of a few generations. Advices from the road showed that the weather was favorable for getting out logs. The snow has not yet disappeared, and has facilitated teamsters in the task of hauling out to the rivers. The shanties of the firm are seven in number, and are located on the Coulonge, Petewawa river, Bissett's creek, and Lake Temiscamingue, employing in all over 350 shantymen.

Mr. Booth could not be found by a reporter. The cut of this firm is estimated at over 55,000,000.

From private information received by a gentleman in this city from the Hon. H. G Burleigh, an extensive lumberman in New York State, now at Washington, it is learned that there will be no change in the tariff on lumber this year. It was generally expected among the trade, that the duty would this season be removed entirely from lumber exports; and consequently there was something like a boom in cutting and shipping circles. We are pleased to learn however, that our Canadian lumbermen will not be seriously affected by this prospect, as the cut for 1886 is already in most cases disposed of.—*Ottawa Journal.*

AN EXTRAORDINARY OFFER.
To all Wanting Employment.

We want Live, Energetic Agents in every county in the United States and Canada, to sell a patent article of good merit, on its merits. An article having a large sale, paying over 100 per cent profit, having no competition, and on which the agent is protected in the exclusive sale by a deed given for each and every county he may secure from us. With all these advantages to our agents and the fact that it is an article that can be sold to every householder it might not be necessary to make an "extraordinary offer" to secure good agents at once, but we have concluded to make it to show, not only our confidence in the merits of our invention, but in its saleability by any agent that will handle it with energy. Our agents now at work are making from $150 to $600 a month clear and this fact makes it safe for us to make our offer to all who are out of employment. Any agent that will give our business a thirty days' trial and fail to clear at least $100 in this time, above all expenses, can return all goods unsold to us and we will refund the money paid for them. Any agent or general agent who would like ten or more counties and work them through sub-agents for ninety days and fail to clear at least $750 above all expenses, can return goods unsold and get their money back. No other employer of agents ever dared to make such offers, nor would we if we did not know that we have agents now making more than double the amount we guaranteed, and but two sales a day would give a profit of over $ 25 a month, and that one of our agents took eighteen orders in one day. Our large descriptive circulars explain our offer more fully, and these we wish to send to every one out of employment who will send us three one cent stamps for postage. Send at once and secure the agency in time for the boom, and go to work on the terms named in our extraordinary offer. We would like to have the address of all the agents, sewing machine solicitors and carpenters in the country, and ask any reader of this paper who reads this offer, to send us at once the name and address of all such they know. Address at once or you will lose the best chance ever offered to those out of employment to make money.

RENNER MANUFACTURING CO.,

Market Reports.

TORONTO.

From Our Own Correspondent.

APRIL 9.—The building season has now fairly opened and all the yards are doing a good stroke of business, the main drawback being the wretched condition of the roads between the railroad yards and the main street leading thereto, good teams not being able to bring as much lumber from the cars as should under favorable conditions be hauled by one horse. The railroad yards are a disgrace to the companies owning them, and the approaches leading to them a serious reproach to our city corporation. If the real value of the work is taken into consideration it is worth more money at present to deliver a car of lumber from the track to the yards than to bring the same car from the mills to this city. However, in spite this, by a liberal expenditure of oaths by the teamsters and a large waste of horse flesh, considerable lumber is now being moved from cars to yards and filling of contracts. The most serious question presenting itself to dealers just now is, where to procure enough dry lumber to meet demands until the new cut is fit to move. Nearly all the lumber piled off by track side is of the coarse grades of boards and plank, certainly not 50 per cent would run dressing and better, and the demands from the American side will have the preference for any of the better grades now at the mills.

Shipments from the docks have already commenced, the first cargo of 250,000 having left here for Oswego, ex schr. Jessie Drummand, shippers and owners, Messers. Christie, Kerr & Co. A second vessel is now loading for the same firm. It is generally conceded, however, that shipments during the early part of the season will be light, as all the available stock of last season's cut will soon be shipped out, leaving the present season's cut for early fall shipments.

Lath are coming in more freely, and good demand for dry stock. The ruling price for car load lots is $1.90 per M pieces, on car here. 12 in. stock boards are scarce and numerous inquiries for the coarser grades is made daily.

More attention is given to the various kinds of hardwoods by some of our wholesale firms this spring, and considerable quantities will be shipped eastward to Boston and other places during the coming summer. To sum the whole matter up the outlook for the present season's trade is bright and a general spirit of hopefulness pervades all those interested in the lumber trade.

OTTAWA.

From Our Own Correspondent.

MARCH 26.—With the dawning of spring things about the great lumber mills at the Chaudiere are beginning to put on a bustling appearance, and men and horses are busily employed in getting things ready for the cutting season. It is confidently expected that this year will witness the largest cut of lumber at these mills ever seen before. The prospects, according to the mill owners themselves, were never so bright, and they expect that all their energies will be fully taxed to meet the demand. A project has been on foot here for a considerable time to extend the line of the Canada Atlantic railway to the lumber yards, and the city council and the railway officials have finally agreed on terms, and now preparations are going on actively to carry the project to completion. When this scheme is carried through, which will be accomplished in a few months, lumber can be loaded actually from the saw without the intervention of horse appliance. With the advent of this extension the lumbermen are to put up planing mills immediately on the site now occupied as piling grounds, and the lumber cut to be shipped, will, in future, be piled along the railway track. It is wonderful the expectations of this project. It will undoubtedly be an immense saving to the lumbermen as well as a great convenience, and will also give a largely increased carrying trade to the railroad. This extension, it is estimated, will cost the railway company about $140,000. Heretofore it was felt awkward the shipping of lumber from the mills, owing to the distance it had to be hauled, but with this scheme all that will be done away with and the shipping can be done much more speedily. The lumbermen are to be congratulated on the increased facilities which will come of this scheme. They will now be in a better position to compete than ever before and will not be slow to use the advantage thus placed within their reach. The cutting of the logs in the woods is now practically over for the season, and the drawing is almost completed and weary men and horses can be seen daily coming down from the woods in droves. There are no fears entertained about the logs cut being brought down, as the peculiar kind of a winter gives abundant hopes that water for the drive will be plentiful. In the bush there is a great accumulation of ice and this will keep the spring freshets feed until all the logs cut on the different small streams can be got into the Ottawa river.

APRIL 9.—It was expected with more or less confidence for some time past that the duty on saw lumber to the United States would have been taken off, but by recent advices from the United States agent of the Chaudiere lumber dealers this expectation is doomed to disappointment. This United States agent states most positively that the contemplated relief will not take place, as the duty is to be maintained. The Michigan and other lumber dealers in the United States brought to much pressure to bear on the authorities at Washington, and the tariff will remain just as it was. It might have been known that as long as a tariff was for the benefit of their own people Congress would not consent to remove it, and this being the case, why cannot our Government put an extra export duty on logs, and protect our forests? is the question asked by more than one. It would certainly be to the benefit of the Dominion at large, this protection of our forests, not to speak the protection due the Canadians who have a large capital invested in this industry. As long as the United States sees fit to tax our exports they certainly should be made pay something for our raw material. The cut throat policy of allowing American lumbermen to deplete our forests at their own sweet will, and only pay a nominal price for this privilege, is bound to work anything but beneficially, and now that it has been ascertained without a doubt that the United States are determined to keep up a stone wall against our lumber dealers, why, our Government should reciprocate the feeling and endeavor to either protect our forests by a reasonable export duty, or else gather into the country's treasury some recompense for the wealth taken away. This question has to be met sooner or later, and every day lost in delay will work disastrously. It will not do to find this thing out when the fine forests along the Lake Superior shore are shorn of their wealth, and this wealth gone to enrich a foreign people. Our Government will certainly be very lax in the duty they owe to the country if by their neglect any waste or loss occurs.

In a very short time now the buzz of the saw at the great mills at the Chaudiere and other districts in this locality will be heard, as the spring is evidently at hand. Every preparation has been made for the seasons operations, and all that is required now is balmy weather for the hum to commence. The prospects for getting down the logs to the mills is excellent, and no difficulty is expected as the water will be high. Already large droves of men are penetrating to the different shanties ready with the going of the ice to engage in the drive.

MONTREAL.

From Our Own Correspondent.

APRIL 10.—A brisk business continues to be done here, and considerable activity prevails at the retail yards; car load lots are also moving freely.

The improvement in the market noted lately is expected to be still bettered on the opening of navigation.

It is reported that the last year's supplies are almost exhausted in the lumbering districts, and that large sales have been effected of next season's supplies. These facts make the dealers here look for better figures.

There are no change to note in the prices since last report.

The following are the quotations at the yards:—

Pine, 1st quality, ℔ M	$35 00@40 00
Pine 2nd " "	25 00@30 00

Long Beech "	5 00@5 50
Tamarack "	5 00@0 00

CHICAGO.

The *Northwestern Lumberman* of April 10th says:—Though there is still a fair distribution of lumber from the yards, it must be admitted that trade is somewhat quieter than it was a short time ago. Orders are not coming so numerously, and the trains on track are smaller. The dealers themselves acknowledge a percentage of falling off. The shrinkage is attributed to several causes. Some say that the labor troubles in the southwest have had a depressing influence on the demand; others that the low price of grain is preventing sales among farmers, retail dealers for this reason fearing to stock up. The muddy state of the roads is a hindering cause in the view of some. It is said by a few that the firmness with which lumber is held in the leading markets induces timidity or hesitancy on the part of country dealers; they prefer to get along with as small purchases as possible until the afflux of green lumber shall soften the market. All these propositions shall have weight, and are influencing, to some degree, the present volume of trade. But the wholesale yard men of this city repeatedly overlook the fact that there is usually a falling off of demand in April, and are always disappointed on that account, when it is something they should each year expect.

The reason why the country demand for lumber falls off after April 1st is because the flush of the spring trade is then over. The southwestern spring requirement begins to show up about the middle of February. During the fore part of March Nebraska, Iowa, Illinois and Indiana wake up and call for lumber. By the last of March the retail yards have bought in the stock necessary to carry them along for several weeks. It is natural that country dealers should then wish to pause and consider a little. They know that the mills will soon start, and that there is likely to be a softening of prices in consequence. When April comes dry stocks in the wholesale yards have been broken up in assortment by the early spring trade, and holders are insisting on firm prices. This is especially so this year on common and cull lumber, classes most needed in the western shipping trade. It is probable that some are now hesitating about buying on this account.

While there is usually a falling off in April from the rushing trade of March, it does not follow that absolute dullness is characteristic of April. On the contrary it is month of steady demand, and probably the current month will be no exception to the general rule. The call for local building purposes commonly increases as spring advances. The railway and manufacturing demand also rises as warm weather approaches, so that a healthy trade is maintained, but the flush of the country spring demand is over by the first of March, as has been said. Under ordinary circumstances there is no more rush and vim in trade until August and September.

Receipts of lumber and shingles for the week ending March 25th, as reported by the Lumberman's Exchange:—

GLASGOW.

The *Timber Trades Journal* of April 3rd says:—The arrivals of wood goods at Clyde ports continue light, comprising for the past week one cargo of pitch pine and sundry small imports of oak planks, staves, etc., per steamers.

The only public sales to note is one of deals, which took place here at Yorkhill Wharf, on 25th ult., Messrs. Edmiston & Mitchell brokers.

There was a fair attendance; advantage was taken of the recently opened underground railway, which, having a station at Yorkhill, affords a convenience for buyers coming to the sales The catalogue submitted comprised Michigan pine deals and Quebec and lower port spruce deals; only a small proportion changed hands the demand being very quiet.

The output from the Clyde shipbuilding yards for March was nine vessels, 8,169 tons, an unusually small monthly return. For the quarter the tonnage launched amounts to 28,669 tons, as against 38,316 tons in 1885, and 63,309 tons in 1884 at corresponding date. It is some satisfaction to note, however, that of the work in hand there is a substantial increase, as compared with the state of matters in March, 1885, it being computed that there are at present in the course of construction over eighty vessels, of all kinds, representing, in the aggregate, some 150,000 tons, as against between 50 and 60 vessels, of about 90,000 tons in March of last year.

Among the applications granted at the last meeting of the Glasgow Dean of Guild Court was one of some importance, by the Glasgow Athenæum (Limited), to take down existing buildings and erect new buildings in St. George's Place. The new Athenæum is estimated to cost about £15,000.

The following is a note of prices:—

Michigan 1st pine deals—		Per c. ft.
16 ft.	7/10×3	2s. 9d.
12 to 18 "	10/24×2½	3s. 2d.
Do. 2nd—		
12 to 16 ft.	14/20×2½	2s. 1d.
St. John, N. B., spruce deals—		
22 ft.	9×2	0s. 9½d.
17 "	9×	0s. 9½d.
13 & 14 "	9×3	0s. 9d.
11 "	9×3	0s. 9½d.
9 & 10 "	9×3	0s. 8½d.
Dorchester, N. B., spruce deals—		
16 to 22 ft.	11×3	0s. 10½d.
16 "	9×3	0s. 9½d.
Do. Battens—		
9 to 11 ft.	6/7×2½	0s. 7½d.
Do. ends—		
2 to 8 ft.		0s. 7½d.
Shediac, N. B., spruce deals—		
13 & 14 ft.	9×3	0s. 9½d.

LIVERPOOL.

The *Timber Trades Journal* of April 3rd says:—With a total absence of public sales during the past week there has been but little animation shown in the whitewood market, though an improvement in the demand is perhaps perceptible. This, of course, is in a measure attributable to the sudden change in the weather, which has affected the building trade by affording it a chance of building into life, though we are sorry to say it appears by no means in a vigorous condition.

Though the general grumble all round of the bad state of trade loses nothing of intensity, yet locally there is an impression that we may have now seen the worst and live in hopes that the "good time coming," which has been so long deferred, may soon be within view. At present buyers are still holding off the market, presumably in the hope that, if prices do not go lower than they are now, they will, at any rate, not advance materially; but really the market rates have dropped to such a depth that any slight disturbance of the position might cause an advance before the over-cautious buyer dares to make a move.

The stocks on hand of the principal articles in the market, notably yellow pine timber, spruce deal, Norwegian flooring, and other goods, compare favorably with those held at this time last year, and holders of spruce deals especially are inclined to be firmer in their demands than they have been for some time past.

LONDON.

The *Timber Trades Journal* of April 3rd says:—Business seems to be very quiet around the coast, but some fair lines have been sold during the past week at current prices, and very considerable sales of good stocks could have been made had sellers been disposed to give way in their quotations. The amount of sales effected for leading makes compares very favorably with last year's statistics, and we believe that the total quantity placed this season equals or exceeds that sold during a similar period last year. Sellers, therefore, feel themselves justified in maintaining a firm attitude, especially considering the lateness of the season, and the fact that many leading importers, both in England and France, have not yet filled a tithe of their requirements.

London buyers seem holding back as much as ever, and we learn of little f.o.b. business being actually effected, although agents have done their best to carry contracts through. When dealers here can purchase at auction ordinary goods at 10s. to 15s. less than it would cost to import, it is hardly to be expected that they will purchase on f.o.b. terms until they can see their way clearer than is possible at present. This condition of affairs is likely to continue so long as over-production forces shippers to send forward to the London market unsold goods, which are either sold to arrive at excessively low rates, or knocked down at auction at ruinous prices.

Things are very quiet at the sales; and many of those attending being onlookers, although now and again putting in a bid, the proceedings were unmarked by any animation beyond what always appertains to goods put up without reserve by public auction. We noticed that one or two large dealers who were not buyers last week, were again in the field, and one of them went in for considerable lines, probably influenced by the fact that he got them nearly all at his own price, competition being of the most limited kind.

On Thursday the attendance at the saleroom was rather better, and if there was any difference, the back benches struck us as being better filled; but we cannot say the same of prices. If these were equal to those of the day before, it was as much as they were. The Gefle deals, ex Abeona, went fairly well for mixed, as did the 3rd plank; but the Petersburg best yellow Gromoff's, did not reach £12, and most of the other descriptions and sizes were equally cheap.

Flooring prices ruled low, though we were glad to observe that now and again a reserved lot was bid for; but this is very little to go upon, and merely indicates that sellers have put the limit pretty much on a level with market rates. Mr. Alexander B. Sim occupied the rostrum, and the sale, notwithstanding that prices ruled low, did not hang about much, the bidding at times being fairly active.

Nobody seemed to have an encouraging report of the outside market doings, and we hear on all sides that the building trade is even worse than it was last spring.

In the Canadian trade, says the *Journal* of March 27th, things seem to be going on in the even tenor of their way. We have just heard that a couple of vessels have been chartered by Messrs. Bryant, Powis & Bryant, limited, Three Rivers to London, all deals, at 47s. 6d., the charter we recorded last week also being for the same firm. We may observe, *en passant*, it is very seldom that any hardwood is shipped from Three Rivers. At the present rates of freight shipowners must be out of pocket. How long this will last it is difficult to tell, but at present there are no signs of any improvement. The shippers from the other side of the Atlantic, who generally pay the mother country a spring visit, appear to be making a longer stay than usual in the metropolis. Amongst those whose names have come under notice now in town are Mr. Dobell, Mr. Burstall, Mr. Murphy, all from Quebec, the lower ports being represented by Mr. Snowball, of Miramichi, and Mr. Girouard, of Betsiawitz. Mentioning the spruce ports reminds us that, though this class of wood continues dull, Mr. Snowball has nevertheless made his usual contract with the Leadenhall street firm.

Considerable quantities of pine deals have been sold for forward delivery at satisfactory prices. The market in London continues to be well sustained, especially in the lower qualities, stocks of which are about to be somewhat limited. The demand for fourth pine appears to have grown with the supply. A few years back this quality was unknown, and now it is inquired for on all sides. Thirds also have become a staple article of consumption amongst users of pine.

WOOD-WORKING PATENTS.

The following list of patents relating to the wood-working interests, granted by the United States Patent Office, March 30th, 1886, is specially reported by Franklyn H. Hough, solicitor of American and Foreign patents, 925 F. Street, N. W., Washington, D. C.

338,967—Morticing machine—A. J. Heuse, Baltimore, Md.

338,967—Planing and matching machine—C. Johnson, jr., Baltimore, Md.

338,787—Saw filing machine—S. C. Rogers, Hamilton, Ontario, Canada.

339,000—Saw mill, reciprocating—H. Mc Evilla, Muskegon, Mich.

338,884—Saw mills, log pusher for—R. W. Shelburne, Blandville, Ky.

338,693—Saw setting device—C. J. Belch, East Minneapolis, Minn.

339,020—Saw vice—O. Seely, Syracuse, N. Y.

PATENTS ISSUED APRIL 6.

339,195—Boring machine, square hole—A. E. & J. C. Lake, Big Prarie, O.

339,554—Boring tool and holder, combined—S. P. Graham, Galt, Ont.

339,109—Lumber, compound—J. Marris, Philadelphia, Pa.

339,s39—Saw mill, band—C. Esplin, Minneapolis, Minn.

339,576—Saw sharpening machine—L. O. Orton, Philadelphia, Pa.

339,314—Turning wooden spirals, machine for—V. Merklen, New York, N. Y.

THE Muskoka *Herald* says:—The Mills of the Georgian Bay will munufacture this year 203,500,000 feet of lumber. In addition to this there will be 16,500,000 feet, for export in log. The cut at Gravenhurst and vicinity will be 52,500,000 feet an the mills of Severn, Lethbridge and Longford will turn out 22,000,000 feet of lumber. The cut of board pine on the Georgian Bay, Muskoka and Severn rivers, including a small quantity of square timber on the Severn, will be about 1,532,000 feet. This is a large cut and it looks as if the manufacturers expect better times in the lumber trade.

JOHN A. A. BENSON, representative of the Waterous Engine Works Company, of Brantford, who has just returned from North Bay, *via* Ottawa and the C. P. R., having driven from Gravenhurst across through Muskoka and Parry Sound district, reports sales in their line good. Jobbers are happy, the winter being as if it was made to order, and snow is plentiful from the terminus of the Northern to the Dominion capital.

LUMBER IN ALASKA.

THE *Alaskan*, of Sitka, Alaska, in its issue of February 27th, remarked as follows:—

The lumber question, unless congress gives us at once some legislation which will authorize the purchase of timber lands, or timber, in Alaska, is going to be a very serious one, and produce much trouble in the immediate future. Letters from Juneau mention the fact that a great deal of building would now be going on there, but for the fact that there is no lumber at all on hand. There can be no doubt that a large influx of population will commence next month; indeed the tide has already begun to set in. It is certain that works looking to the thorough development, and continued operation of several ledges which have thus far been worked only to the amount of the necessary annual assessment labor, and designed by the ledge owners, will be commenced as soon as the material can be got together. Every year adds something to the known placer area of the territory. All this steady growth of the mining enterprises carries with it a corresponding increase in all kinds of business used to a growing country, and there is no article the importance of which is more felt than lumber. It seems indeed hard that the facilities which might be so easily made available here, to the rapid opening up of the country, should be denied to the people, and that the territory should remain still a monument not only of the perfidy of the goverment which owns it, but of the loss and detriment which such perfidy carries with it. Honesty is the best policy, and the United States would soon be enjoying a happy realization of the truth of the proverb in the income from Alaska, if it would but try its application to the development of the territory, by the simple accordance of just and equal laws with those enjoyed by all the people elsewhere.

The Seattle *Chronicle*, of a late date, had the following:

By a recent order of the interior department saw mills in Alaska are not permitted to cut logs and manufacture the same into lumber, except for the personal use of the proprietors of the saw mills. The order is based on the fact that there are no land laws in that territory, and no person can acquire ownership to real property. The only person who have title to real estate are a few Russians who owned land in Sitka at the time of the transfer of the territory to the United States. Of course the transfer did not deprive them of the title to their land. The effect of the order has been to close the five saw mills in Alaska. The largest was located at Wrangel and had a cutting capacity of about 20,000 feet a day; another was near Sitka, with a capacity of 8,000 a day. The five mills had a total capacity of 50,000 feet a day when in full operation. There is at present considerable demand for lumber in Alaska, particularly at Juneau City, where a cargo of 500,000 feet would be snapped up in double quick time at from $25 to $30 a thousand. There is a considerable influx of prospectors and miners into the country, which will cause an increased demand for lumber. The shipment of lumber there, at least for a time, would undoubtedly be exceedingly profitable. The sailing vessel on her return trip, could put in at Glacier bay and and load with magnificient ice cut from one of the natural wonders of the earth—a great glacier breaking off by small degrees and falling into the sea. This ice could be cut and sold at handsome rates in the markets of Victoria, Seattle and Portland, where natural, thick, pure ice is an unknown thing.

"Foreign Trade Gazette."

The *Foreign Trade Gazette* is the name of a monthly journal recently established in New York and devoted to international, commercial and financial topics. It is printed in English and Spanish, the same intelligence being printed in parallel columns, one column being in English and the other Spanish. At present the United States has the bulk of the trade with the countries in the Americas, in which Spanish is the prevailing language—the West Indies, and Central and South America—but we hope to see the Canadian trade with these countries increased.

The Rising Generation

sun should find you resolved to give Ayer's Sarsaparilla a thorough trial. It will cleanse and invigorate your blood, and restore the vital organs to their natural functions. Mrs. J. D. Upham, 231 Shawmut avenue, Boston, Mass., writes: "For a number of years I was troubled with Indigestion, and unable, without distress, to take solid food. After using Ayer's Sarsaparilla one month I was

Entirely Cured."

Mrs. H. M. Thayer, Milton, Mass., writes: "I have been very much troubled with torpidity of the liver, and Dyspepsia. Ayer's Sarsaparilla has cured me." Mrs. J. W. Bradlee, Hyde Park, Mass., writes: "I was greatly reduced by Dyspepsia, and was advised to take Ayer's Sarsaparilla, which entirely cured me." Mrs. M. F. Hamblett, 25 Lawrence street, Lowell, Mass., writes: "I was sick two years with stomach and liver troubles, and obtained no relief until I took

Ayer's Sarsaparilla

saparilla. Since that time I have enjoyed excellent health."

follows generation, transmitting a legacy of good or ill, according to well-known physical laws. To the unfortunate sufferer from hereditary Scrofula, nothing can be more cheering than the assurance that in Ayer's Compound Extract of Sarsaparilla is found a constitutional remedy, which eliminates the poisonous taint, and restores to the blood the elements necessary to

Life and Health.

Alarie Mercier, 3 Harrison avenue, Lowell, Mass., writes: "My son was weak and debilitated, troubled with sore eyes and Scrofulous humors. Ayer's Sarsaparilla restored him to perfect health." Irving H. Edwards, Ithaca, N. Y., writes: "From the time I was four years old, until eighteen, I was subject to Scrofulous sore throat. Many a time my neck has been a raw sore, from poultices put on to draw out the inflammation. I took four bottles of Ayer's Sar-

Ayer's Sarsaparilla

and have never had the disease since, in sixteen years."

FOR THE

Canada Lumberman

IT WILL PAY YOU, BECAUSE :

1. It is the only newspaper published in the Dominion of Canada devoted to the lumber and timber industries.
2. It is devoted to the development and utilization of our forest wealth.
3. It furnishes complete and reliable quotations of prices of lumber in all the leading markets.
4. Its columns are filled with interesting reading matter, valuable alike to the land owner, manufacturer or dealer.
5. It costs only $2.00 per year to have it sent, post-paid, to any address in Canada, and no land owner, lumber dealer, manufacturer or individual in any way connected with timber industries, can afford to do without it.

☞TO ADVERTISERS.

It has a circulation among saw mill owners, manufacturers, lumber and timber dealers and all classes connected with the timber business.

Examine the field, count the cost, and you will at once decide that the CANADA LUMBERMAN is the

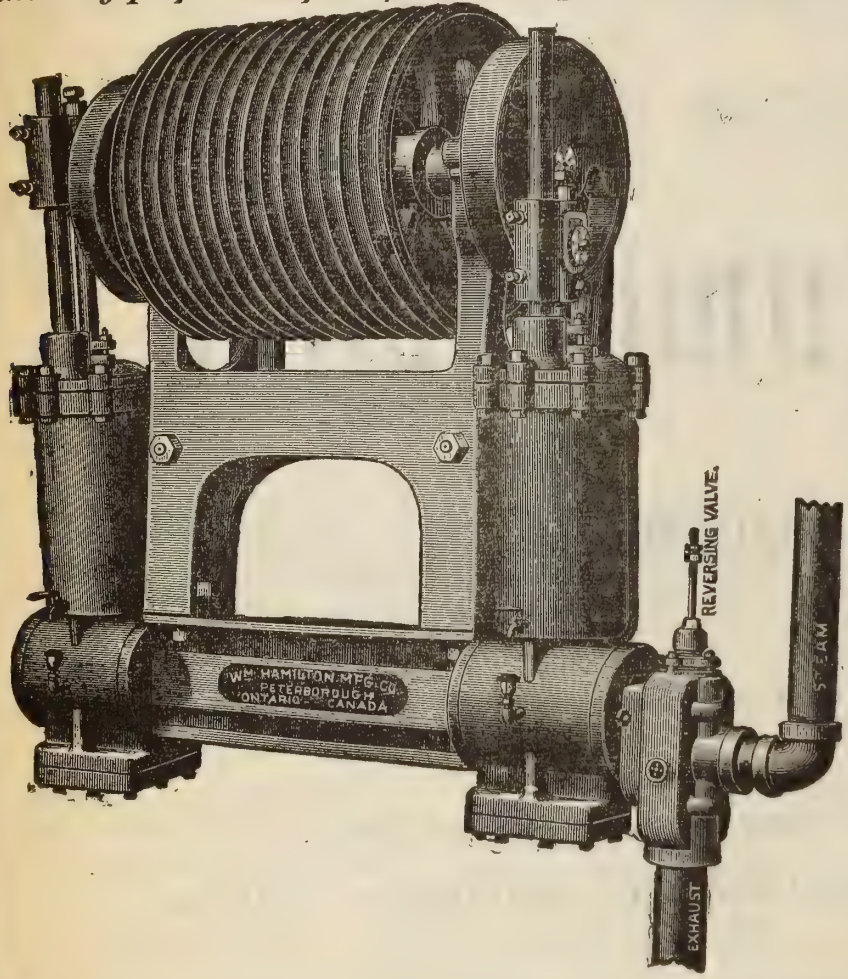
———CHEAPEST, BEST, MOST RELIABLE and ONLY TRUE MEDIUM———

for placing your goods or wares before the saw-mill men and lumber and timber dealers of the Dominion.

CUNNINGHAM'S
PATENT OSCILLATING TWIN ENGINE

FOR STEAM FEED IN CIRCULAR MILLS WITH RACK OR ROPE.

This Engine has practically but two moving parts, aside from cranks and shafts. The whole array of eccentrics, valves, valve rods, connecting rods, cross heads, slides, levers, rock shafts, bell cranks, etc., is done away with, and the very perfection of simplicity, compactness, durability and cheapness attained.



The above engraving illustrates the Twin Engine, 10x16, for Rope Feed, for Saw Mill Carriages. The spool is 27 in. diameter, 30 in. face, is grooved 2 in. pitch for 1½ in. rope. The shaft is steel, 4½ in. diameter, with disk cranks. No connecting rods, eccentrics or valve rods to get loose and out of order. The ports are in the trunions, and worked by an oscilliation of the cylinders, and are held in their place in the downward motion by a steam cushion below. The sawyer's valve is a perfect balance, and by moving this valve the engine can be reversed, stopped or started almost instantaneously if necessary, as the sawyer has perfect control of it by his lever either to go fast or slow. Should the sawyer let go of his lever either by mistake or any other cause, it is balanced so that the valve will come to the centre and cut the steam off both cylinders and stop the feed. When standing, the lever is locked or fastended, so that is is impossible for it to start off itself. The engine stands upright below the carriage, and bolted to two upright beams, placed on the mill for the purpose. When a rack is preferred in place of the rope, we put on a steel wheel 30 in. in diameter, and the engine placed high enough to work into the rack on carriage bar, or if the beams come in the way, an idler wheel can be used between engine and rack segs; or, the engine can be placed at a distance and have a shaft from it to the carriage; or it can be placed in the engine room, where it is under the control of the engineer for oiling, thence by shaft and pinion to carriage rack bars. These engines are well adapted for cutting long logs, or where the logs are mixed, the advantage of this feed will be apparent to mill men. When the carriages are used in two or more sections, the couplin and uncoup ling of each section is quick and simple.

There were two of these feeds working this summer and giving the best of satisfaction, one with rope feed at James Playfair & Co's Mill, Sturgeon Bay, near Waubaushene, and one at the new mill furnished by us to Francis Carswell & Co., at Calabogie Lake, on the Kingston and Pembroke R. R. This mill is working with the Rack and Pinion feed, and drops from fifteen to seventeen stock boards per minute. We have also sent one to the Rathbun Company, Deseronto, to put in to feed their heavy Circular Mills. They will also commend themselves for various other cases, especially for running Elevators, hoisting Engines, and wherever a simple and easily reversible motion is required.

We would also call attention to our Improved Hand Saw-Mill for cutting logs

☞ ***We guarantee this to be the best Mill of its kind got up, and would ask any one wanting a good Band Saw-Mill to communicate with us. We would also call the attention of Mill Men to our new IRON GANGS, CIRCULAR MILLS and MILL MACHINERY. For further information, prices, &c., address the Manufacturers,***

VOL. 6. **PETERBOROUGH, ONT., MAY 1, 1886.** **NO. 9.**

A SHORT line of railway from Broad street, Ottawa, to the Chaudiere lumber yards, is to be constructed at once by the Canada Atlantic Railway Company.

IT is said that the Ontario Lumber Company have sold their last year's stock, about 6,000,000 feet, cut at G. W. Taylor & Co.'s mill, for $13 a thousand.

THE schooner Jessie Drummond, loaded with lumber, and bound from Toronto, Ont., to Oswego, New York, was caught in the storm of April 6th, and lost 50,000 feet of her cargo.

GEORGE M. BROWN and S. S. Wilhelm are said to have purchased 320 acres of pine land in town 18-5 west Michigan, estimated to cut 8,000,000 feet of logs. Consideration $35,000.

THE schooner Lynx, of St. John, N. B., fo New York, lumber laden, was wrecked off Milk island, Mass., April 8th. The crew was saved. The vessel and cargo were partly insured.

IT is reported that Judd & Goddard, of East Saginaw, Mich., have sold to the Eddys and Averys of Bay City, 2,000 acres of pine land on Tequamenon river, upper Michigan, estimated to cut 30,000,000 feet of logs, for $76,000.

THE Berlin Mills Lumber Company, at Berlin Mills, Me., will save the sawdust at their mills the coming season, for use in the pulp furnaces of the Glenn Manufacturing Company and the Forest Fibre Company. That is one way of working sawdust into paper.

THE new dock and flour warehouse, at West Superior, opposite Duluth, will have a total length of 1,800 feet. Timber will be sunk 18 feet under water, dredging for that purpose to begin as soon as the ice goes out. The Manitoba railroad is behind the enterprise.

MR. J. WHITESIDE, in addition to the 700,000 taken out for the Muskoka Mill & Lumber Co., reported a few weeks ago, has also taken out for himself, in Chaffey township, 1,000 000 feet which he has arranged to have manufactured at Gravenhurst.

A MAN named George Southerland was recently engaged at Noxon Bros'. establishment, Ingersoll, in operating a circular saw, when the piece of wood which he was sawing was thrown from the saw and struck him upon the face with such fearful violence as to cleave it open from forehead to chin.

MR. ISAAC SCOTT is taking out a second cargo, 200 cords, of poplar, at Point Aux Pin for an eastern paper mill. Eastern paper manufacturers would do well to turn their attention in this direction, where their are immense forests of soft woods suitable for their purposes.—*Algoma Pioneer.*

THOMAS MCCORMACK, of Deep River, lost a valuable team of horses in Deep river, on April 14th. They were drawing in Masson's shanty, and one of the concern teams broke through the ice. Mr. McCormack's team was near then and was going to the assistance of the other team when he broke through. The team was worth $300.

AN employee in Walker's saw mill, Calgary N. W. T., named John Monahan, was caught by a belt and hurled directly on one of the saws. His left arm was terribly lacerated, and the saw penetrated the left breast almost through the ribs. The arm was amputated above the elbow and he may recover.

THE Eastern Lumber Company has been incorporated by Jacob Reidler, F. Ferguson and Francis Beidler, all of ıicago, and connected with the South Branch umber Co. The object of the new company is arry on a lumber business at the East with ard and headquarters at Tonawanda, N. Y. Capital stock, $100,000.

ONE of the schooners engaged in the lumber trade of the lakes is the Harriet Ross, an old craft that was in "Perry's victory" naval engagement on Lake Erie. She is now in dry dock, Chicago, undergoing repairs. It is claimed that shot have been dug out of some of the old timbers of the vessel, and this is adduced as evidence that she was really in the famous fight of 1813.

FROM recent observations, Captain Pillsbury finds that the strength of current of the Gulf Stream is invariably on the Florida, instead of the Bahama, side of the stream. He has found the temperature of the stream to range from 42 to 81 degrees. The greatest velocity of the stream at the surface is about four and a half knots, but the fluctuations are frequent and great.

THE Belleville *Ontario* of a recent date says: Mr. James Buck has been rafting timber here for the Quebec market. A large gang of men are employed getting the timber in shape for the rafts. Two train loads have already arrived. The timber is loaded along the line at Hastings, Sterling, Hoard's and Birdsall. The load this time came from Hoard's station. One tram load a day will be brought in for a couple of weeks.

THE Yukon, the great river of Alaska, stands seventh among the rivers of the world. It takes its water from an area of 200,000 square miles, and its total length is 2,044. For 1,000 miles it flows through a country very little known; an expedition under the direction of Lieutenant Schwatka set out from San Francisco in 1883, and thus much valuable information about the geography of the country through which the Yukon flows has been obtained. The severity of the extreme north latitude in many parts of Alaska, as in British Columbia, is greatly modified by the warm ocean currents coming from the China Sea.

The Thorncliff correspondent of the Pembroke *Observer* says:—There has been a considerable amount of square timber taken out in this district during the past winter, and it may not be uninteresting to your readers to give them the following statement received from an official source:

	Cubic ft.
Fraser & Sereny, Chelmsford	125,000
" South River	250,000
Wm. Allen, "	100,000
David Moore, Sturgeon River	500,000
Barnet & Mackie, "	500,000
R. H. Klock, Veuve River	200,000
Timmins & Gorman, Wahnapitai	175,000
McArthur Bros., "	200,000
Hugh Coburn, Sudbury	100,000
	2150,000

These are about the figures they will amount to in Quebec. Besides this amount of square timber there was taken on about 260,000 saw logs. All the saw logs excepting Klock's will be carried over Mr. J. R. Booth's railroad. Besides this about 50,000 saw logs go to Bay City, Mich, belonging to the Emery Lumber-iug Co.

EDINBURGH INTERNATIONAL EXHIBITION.

Visitors to Scotland this year will find an additional attraction in the International Exhibition, which will shortly be opened in Edinburgh, the ancient and historic capital of the country. While the exhibition is open to the products and industries of all nations, and of these there will be a large display, the most prominent feature will naturally be illustrations of the industrial, scientific and artistic pursuits which occupy the time and energies of the Scottish people. Every industry throughout the length and breadth of the country will be adequately represented, and there will be many exhibits illustrative of the social life and habits of Scotsmen in their own homes. The exhibition has the patronage as well as the active support of Her Majesty Queen Victoria and selections from the treasures in the royal palaces will be included in the exhibition. Special arrangements are being made with various tourist agencies, for the cheap conveyance of visitors to Scotland from nearly all parts of the world, and, doubtless, a large number of our countrymen will take advantage of this opportunity of visiting a country abounding in romantic scenery and full of historic associations. The exhibition grounds, which belong to the municipality, are in the centre of the city and extend over an area of twenty-nine acres. The buildings cover about eight acres and are divided into large courts illuminated by electric light. The length of the central corridor alone is 750 feet. In consequence of the great demand for space the exhibition authorities had to greatly increase the area for allotment. Four principal divisions have been made in the arrangement of the exhibits, namely, the General, the Fine Art, Artizan and Women's Industries,

IMPORTANT DECISION.

The Court of Appeal delivered judgment on April 20th in the case of the Queen v. The St. Catharines Milling and Lumber Company, dismissing the defendants' appeal from the judgment of Chancellor Boyd. The action is one brought by the Queen on the information of the Attorney-General of the Province of Ontario against the St. Catharines Milling and Lumber Company to have it declared that the Province of Ontario is entitled to 2,000,000 feet of pine timber cut by the defendants on property situate in the district of Algoma south of Wabiroon lake and between Lake Eagle and Lake Superior, and for an injunction to restrain the defendants from trespassing on that property. The company claim title to the timber, setting up leave and license from the Dominion Government. They deny title in the Province, and contend that the land in question was formerly the property of the Indians, and was by them ceded to the Dominion in consideration of large payments of money to the tribes, and that the Indian title passed to the Dominion by purchase as well as by inherent right. Chancellor Boyd heard the case in the first instance, and found in favor of the Province, and the defendants appealed to the Court of Appeal. The four judges are now unanimous in dismissing the appeal maintaining the right of the Province to the property in question. Messrs. McCarthy, Q. C., A. R Creelman and W. Creelman appeared for the Company, and the Attorney-General of Ontario and Mr. Walter Cassels, Q. C., for the Province.

THE Canadian patent office record for March announces the issuance of the following patent of interest to lumbermen: No. 23,301, to Geo A. Haggart, Millbrook, Mich., for a drag saw No. 23,302, to T. W. Smirle, Norwood and James Chapman, Rockland, Ont., for a saw swage; No. 23,465, to T. S. Disston, Philadelphia, Pa., for a shingle planing machine; No 23,473, to S. P. Dresser, Pleasant Mount, Me., for a wood sawing machine.

Chips.

ALBERNI, B. C., wants a saw mill to provide lumber for the settlers.

EXTENSIVE forest fires are raging in the vicinity of Tamaqua, Pa.

HALL & Co's barges will take about 5,000,000 feet of lumber this season between Toronto and Ogdensburg.

MESSRS GILMOUR & Co. have commenced the season's operations at their Gatineau mills. Most of the Ottawa mills started on Monday.

AN order for boxes to go to Honduras, Central America, is being filled by Hunter, Tilloston & Co,, Muskegon, Michigan.

THERE was 42,000,000 feet of lumber shipped by rail from Saginaw valley between January 20 and March 31, of this year.

THE imput of logs on the Menominee and its tributaries, in Michigan and Wisconsin, this season, is 435,000,000 feet.

Messrs. Thompson and Baker have sold out the Brydon shingle mill at West Gravenhurst, to Mr. Joseph Tuer of Barrie, for $2,300.

THE Petrie Lumber Company, of Saginaw, has bought 13 500,000 feet of standing pine in Roscommon and Crawford counties, Mich., from Louis Huldebach, for $33,000.

Mr. MEBRON HARRIS will fill a contract to supply 200,000 ties to an Americon railroad this summer and will buy up all along the Rideau and Ottawa rivers.

PREPARATIONS are being made, says the Muskoka *Herald*, by various lumber companies throughout the District, to start their drives. The high water will make running a comparatively easy task this season.

THE Manitoba Government has designated May 12 as a public holiday, to be known as Arbor day, and the Lieut.-Governor of the Northwest territories has designated May 1 for a similar purpose.

THE body of Mr. Charles Sereney, the Ottawa lumberman who was supposed to have fallen through a hole in the ice near Nippissing last December, has been found and taken to Portage du Fort for burial.

THE first four masted schooner ever built on on the Pacific coast was recently launched at San Francisco to go into the lumber trade. Her name is Novelty, and she will carry 800,000 feet of lumber.

PINE land to the amount of 21,587 acres in Bayfield, county, Wis., was lately sold by the Omaha railroad company to the St. Croix Lumber Company and J. E. Glover for $135-900.

THE planing mill of Mr. Thos. Orr, at Stratford, Ont., was totally destroyed by fire on April 12th. The fire broke out about 4 o'clock and originated in the drying kiln. Loss about $10,000; no insurance.

THE log imput on the Winconsin and its tributaries for the season now closed, it is said, was 166,787,000 feet. Of this amount Wausau parties claim that 137,000,000 will go to that place for sawing.

BIG piles of white poplar wood, said to be largely used in the manufacture of paper, were drawn out in the winter, and deposited along side the Central Ontario railway track in many places, but the piles are very conspicuous in the vicinity of Big Springs and Central Ontario Junction.

DANIEL TAYLOR, over 80 years old, of Schroon Eake, N. Y., a year or two ago had his hand mangled by a circular saw. He got well of that and last winter he had his skull fractured while at work in his mill. He has fully recovered from that also, and is again ready to tackle a buzz saw or stand a crack on the head.

WILLIAM CARSON, president of the Valley Lumber Company, of Eau Claire, Wis., went up the Wisconsin Central to intercept the loggers as they came out of the woods, and distribute among them tracts, showing the folly of spending their wages in saloons and low resorts, and urging them to attend the meeting of the Y. M. C. A. at Eau Claire.

CANADIAN LOGS TO MAKE MICHIGAN LUMBER.

The following letter appears in the Montreal *Gazette*:

SIR,—If a doubt ever existed in the mind of any one, as to the propriety of our government adopting the suggestion of the Hon. Mr. Joly to increase the export duty on saw logs, it would be removed by knowing in what light existing arrangements are viewed by Michigan lumbermen. In the last issue of the *Lumberman's Gazette*, of Bay City, Michigan, Col. M. Jeffers, of East Saginaw. says:—"I have bought from parties in Canada 500,000 acres or twenty townships, of standing white pine on the Serpent, Spanish and Musassaga rivers, Georgian Bay." This tract contains 2,-000,000,000 feet of pine timber with a saw mill at the mouth of Serpent river that cuts 40,000,-000 feet a year, with an iron steamer and a tow of barges. The whole plant costing $400,-000." And after stating that Governor Alger of Michigan, and Col. Bliss, of Saginaw, are interested in the same region, he says: "We propose to bring the logs over and saw them in Michigan. We are Michigan men and hope to make our purchases inure to the benefit of our people here. Notwithstanding our investments in Canada, we still stand by protection for Michigan lumber."

In another part of the same paper the Hon. Isaac M. Weston, when criticising the Morrison Tariff bill, says:—"We now admit Canadian logs free of duty. On the north shore of Lake Erie Canadian saw mills are in ruins, but the mills at Tonawanda, N. Y., are employing thousands of American workmen, manufacturing Canadian logs towed from the Erie north shore. The Saginaw mills are running out of American stock and already they are looking to Georgian Bay for Canadian logs to cross the Huron lake and keep their mills and men at work."

So that the advantages Canada is to derive from sales of her timber lands to Col. Jeffers, the Governor of Michigan, Col. Bliss and others, is to have "her saw mills in ruins. her workmen out of employment and her timber towed over to Michigan, to be there made into lumber to compete with lumber manufactured in Canada, at a disadvantage of $2 per thousand U. S. duty—all in the interests of these gentlemen, who, not satisfied with their good investments in Canadian timber, boast of their hostility to Canadian interests. No, gentlemen, not quite so fast, as Canadians we are slightly interested in this matter and will try to have "our timber inure to our people here," and "still stand by the protection of Canadian lumber." We have no special desire that Canadian saw mills should be in ruins," in order that "New York (or Michigan) saw mills may employ thousands of American workmen manufacturing Canadian logs." If we cannot have free trade in lumber with you, let us have fair trade, cast in your lot with us, manufacture the lumber here, and enjoy equally with ourselves the privilege of contributing $2 per M to the revenues of your country on any lumber sent there. It is bad enough to have our timber pass into the possession of strangers at a tithe of its value, but the country should at least be entitled to what little benefit it might derive from having the timber manufactured here. We have not such a superabundance of pine timber left that we can afford to part with it entirely in the interest of our cousins across the line, however much we may admire their disinterestedness in relieving us of it now that they acknowledge they have about used up their own.

The United States tariff on Canadian lumber is $2 per M. The Canadian export duty on saw logs is $1 per M. And since the United States Government admit logs free, there is a clear advantage of $1 per M in favor of manufacturing Canadian logs in the United States. This discrimination against ourselves the Michigan lumbermen, who control the action of Congress by preventing the removal of duties from lumber, flatter themselves will be quietly submitted to by us, but it is well to let them know at once and distinctly that while we are now, and have at all times been, ready to remove the export duty on saw logs when the United States lumbermen permit their servants in Congress to remove duties from Canadian lumber, yet we are disposed to favor in any way by fiscal arrangements, the closing of Canadian saw mills in order that labor that should be employed in Canada should find employment in United States.

The question then is as to what would be a fair rate to fix for the export duty on saw logs? In order to foster Canadian manufactures it would, of course, be best to have a rate almost prohibitory, but I should not propose this, and think that $4 per M would be reasonable. That is, $2 to counterbalance the United States duty on lumber and $2 more for national protection, a sum claimed to be very moderate for this purpose by all United States lumbermen.

Trusting that our Government may grant us, as our United States friends are so fond of saying, this moderate measure of protection,

I am, dear sir,

Your ob't servant,

WILLIAM LITTLE.

GLASGOW.

The *Timber Trades Journal* of April 17th says:—The principal arrivals to note for the past week are a cargo of pitch pine and one of teak timber at Greenock. The arrivals of pitch pine since the beginning of this year are represented by a carrying tonnage of 11,000 tons; same period 1885, 5,178 tons, and 1884, 9,023 tons. In view of the ample stock of pitch pine on hand and moderate consumption, owing to quietness in shipbuilding, a light import will suffice for the wants of this market.

The arrivals of teak to Clyde this year have been by a carrying tonnage amounting to 3,927 tons. as against 4,376 tons corresponding date 1885, and 4,148 tons in 1884.

The yards at Yorkhill, Glasgow, for storage of deals have now a very bare appearance. The stock of deals they at present contain is about 800 St. Petersburg standards under that of a year ago, the decrease this year being principally in lower port pine deals.

There has been one arrival at Grangemouth within the past week, a cargo of battens from Drontheim, consigned to Messrs. Brownlee & Co. The imports there up to this time of the year are never a large amount, but for the current year, so far, they have been unusually light.

No auction sales of timber or deals have been held by brokers at Clyde ports during the past week.

Some vessels forming a portion of the Quebec fleet left the Tail-of-the-Bank for the outport this week. They carry coal at a freight, it is stated, of 2s. 9d. a ton, which will just pay for the loading and discharging. The fleet is later this year in leaving the Clyde. Freights, Quebec to Clyde, about 18s. per load.

On the 8th inst. there was lauched from the shipyard of Messrs. J. & G. Thomson, Clydebank, H. M. S. Brisk, the third of the Scout class of cruisers contracted for last year. The Brisk, which resembles her predecessor in every particular, is expected by her builders to attain a speed of close upon eighteen knots an hour.

It is a fact that can be verified everywhere that West's Cough Syrup is the only compound known to science, that can eradicate the seeds of consumption in its early stages, and completely cure Coughs, Colds, Asthma, Bronchitis, and all Throat and Lung difficulties. Sold by J. D. Tully, druggist. Price 25 cents, and 50 cents, and $1.00 per bottle.

If your children are troubled with worms give them Mother Graves' Worm Exterminator safe, sure, and effectual. Buy a bottle and give it a trial.

The largest Manufacturers in the world of Vulcanized India Rubber Goods for mechanical purposes.

Rubber Belting from ONE to SEVENTY-TWO inches wide. *Hose,* for conducting, suction and steam. *Packing,* Cloth Insertion and pure *Tubing* of all kinds. *Rubber, Linen and Cotton Fire Hose. Leather Belting,* Extra heavy American Oak Tanned.

☞ *A Full Stock always on hand. Write for Price Lists and Discounts.*

Works also at NEW YORK and SAN FRANCISCO

New York Lumber Auction Co
(LIMITED.)
OFFICE AND YARD, Foot West 21st Street, New York City.

REGULAR SALES will be held during the year 1886, as follows:

Tuesday,	*April 6th,*	*Tuesday,*	*August 10th,*
do	*May 11th,*	*do*	*September 7th,*
do	*June 8th,*	*do*	*October 5th,*
do	*July 13th,*	*do*	*November 2nd,*

and Tuesday, December 7th.

Sales commence promptly at 10.30 a.m. Wm. Easton, Auction'r

At each of these sales we shall offer a full and complete assortment of the best grades of
HARDWOODS AND PINE LUMBER.
Dealers and consumers will find it to their profit and advantage to attend. Catalogues giving the inspection of each lot offered can be had at the yard on the day of sale, or will be mailed on application. Address

DR. E. C. WEST'S NERVE AND BRAIN TREATMENT, guaranteed specific for Hysteria, Dizziness, Convulsions, Fits, Nervous Neuralgia, Headache, Nervous Prostration caused by the use of alcohol or tobacco, Wakefulness, Mental Depression, Softening of the Brain resulting in Insanity and leading to misery-decay and death, Premature Old Age. One box will cure recent cases. Each box contains one month's treatment. One dollar a box, or six boxes for five dollars; sent by mail prepaid on receipt of price. We guarantee six boxes to cure any case. With each order received by us for six boxes, accompanied with five dollars, we will send the purchaser our written guarantee to refund the money if the treatment does not effect a cure. Guarantees issued only by J. D. TULLY Druggist, Sole Agent for Peterboro

WEST'S WORLD'S WONDER or family liniment has proved to be one of the greatest blessings of the age. It is a never failing remedy for rheumatism, cuts, sprains and bruises. Call on J D Tully for a trial bottle and you will use no other

THE CANADIAN PACIFIC RAILWAY.

It may be, and is, undoubtedly true that the primary objects of the road have been to connect the various Provinces of the Dominion, and open up her vast and fertile tracts of country to settlement and production; but if Canada had only these objects to depend on it would be questionable whether the enormous expense of so vast an undertaking would be ever remunerative or warrantable under the most exaggerated ideas of prospective growth either in population or trade. When, however, in addition to these considerations, which are the chief, if not the only ones, the other various American Pacific lines of railway can rely upon, there comes to be added the grand national and Imperial idea for a continuous all-British line of transportation around the world, of which the Canada Pacific railway is to form the main connecting link, then all doubts as to the warrant for its creation, and as to the unquestionable guarantees for its almost incal cuable prospective remuneration, will kick the beam in the scale of pure financial reasoning or vanish like the mist of a midnight dream of apprehension in the morning.

It is an axiom in science that a chain is no stronger than its weakest link. The truth of the same principle holds good as to the connecting links that hold a nation together. If England should rely solely upon the Suez Canal, which the sinking of a single ship therein could effectually blockade, the tenure of her Asiatic and other eastern Colonial possessions would be held by a slendor thread, and the vast sources for her wealth of commerce, both present and prospective, would be liable to evaporation, It is not for that end that she has girded the globe with guns, the sea with ships, and the whole world with the products of her labor. The Canadian Pacific railway not only completes but connects her national chain of communication which almost any human combination would find it difficult, if not impossible, to sever. The attempt, however, would prove like the terrible shock of the most highly-charged galvanic battery to the reckless grasp of an uncalculating hand.

But these may not, without justice, be said to be mere ideas. Give us facts.

It is a well-known fact, as has been authoritively announced, that it is the intention of the directors of the Canadian Pacific Railway to place a line of fast steamers to ply between those countries and various ports of India, Australia and New Zealand. The early direct connection by steamers between British Columbia and those last named islands of the Pacific is also part of the Canadian Pacific Railway's programme.

Up till very recently the site for the western terminus on the Pacific has not been made publicly known. Within the past week, however, it is announced that the Canadian Pacific road has definitely selected the head of Burrard Inlet as the site for the western terminus. The port will be called Vancouver, and the construction of wharves and railway stations commenced forthwith. The track will be extended by the end of June next, twenty miles from Port Moody to Vancouver—the terminal port.

By or before that time it is expected that their line of steamers to Japan and China will be placed on the ocean route.

A recent despatch from Ottawa, by the correspondent of a leading Chicago journal, states that "The reason why the Pacific Mail Steamship Company, of San Francisco, manifested so much anxiety to conclude an arrangement with the Canadian Pacific railway for connecting the lines of the latter with San Francisco has leaked out, and, in consequence, ex-Governor Perkins' recent visit to Vice-President Van Horne, of the Canadian Pa ific Railway, at Montreal, has a wider significance.

"It turns out that the Pacific Mail Steamship Company, which Mr. Perkins represents, receives a very large share of its earnings from the British Government for carrying the English mails; and that the company was notified a few months ago that such subsidy would cease in July next. This notification was sent out in pursuance of arrangements entered into between the English and Dominion Governments and the Canadian Pacific Railway for the transport of all English mail matter, now sent by way of San Francisco to Japan, China, and the New Zealand and the Australian Colonies, to go by the all-British route."

The same correspondent learned from a leading member of the House of Commons at Ottawa—Hon. J. J. C. Abbott—who is the chief solictor of the Canadian Pacific Railway, that one of the most important measures to be submitted to the present session of the Dominion Parliament is the scheme settled upon by British and Dominion Governments and the Canadian Pacific Railway for a continuous all-British line of transportation from Great Britian via Montreal and Vancouver to Japan, China, New Zealand, Australia and the East Indies—a measure which must greatly change the course of trans-Pacific and trans-Continental trade. He adds:—

"Latest reports from San Francisco indicate that the mercantile community are greatly agitated over the possible results of the new arrangements."

I referred previously to the advantage which the more northerly position of the Canadian Pacific Railway gave it in a shorter distance from ocean to ocean over other and more southerly lines; but this land distance, so saved, is nothing as compared with the ocean distance saved by the water portion of the route of communication between Europe and Asia via the Canadian road over that between those continents via New York and San Francisco.

Vancouver, the Pacific terminus in British Columbia of the Canadian line, is 800 or 900 miles nearer Japan than is San Francisco; and the Atlantic terminus (as yet unfixed upon, but which must necessarily be in Nova Scotia,) will be about the same distance nearer England than is New York, as Vancouver is nearer Asia than San Francisco; so that we have nearly two thousand miles of ocean voyage saved in favor of the Canadian route. This in the transportation of cargoes of teas means a great deal more than the mere saving of time and expense, for, as every one knows, the ocean voyage is more or less destructive of the fine flavor and quality of teas—the chief reason why they are so carefully encased in tin to keep out the sali e effects of the sea water. The overland transport of teas from China into Russia is the chief reason for the superior quality of the tea drunk in the latter country over every other out of China. Hence from both these causes—the great shortening of the sea distance in transportation, and consequent lessening of expense, with the additional superiority preserved in the commodity—the Canadian ocean and land line may yet carry all the importations of tea for the United States and America as well as for Great Britain and Europe.

While treating of the probable through international traffic over the Canadian route, I would by no means undervalue the great local traffic which its opening will necessarily and naturally create. To say nothing of the vast agricultural products, lumber, coal and other minerals, the, as yet, almost unavailed wealth with which the Canadian Pacific coast now teem—a wealth not generally known—will add a source of riches in their fisheries as great, if not greater, than that which the Dominion now possesses on her Atlantic shores. The inlets of the Pacific coast of British Columbia abound withe salmon, cod of several species, anchovy, sardines, dog-fish, sturgeon, that sometimes weigh 1,000 pounds, herring, whiting, trout, oysters, clams, and halibut. Whales are plentiful off the coast, and on the islands that fringe

There is a very general belief, especially in that city itself, that Halifax, Nova Scotia, will become the Atlantic terminus of this gigantic railway. But the tendency of the age is to select the nearest available points in all rail or steamship connections. For this ostensible reason, at least, the Canadian Government is pushing on its Intercolonial Railway to Louisburgh, in the Island of Cape Brenton. To reach it, however, a very wide and dangerous strait of the sea, from currents and ice in winter, has to be crossed by ferry—for the expense of a bridge would be as colossal as the structure itself—and even when reached, Louisburgh, as a winter port, is for many weeks (sometimes months) of that season closed to navigation by fields of packed and drift ice extending for miles around the entrance to its harbour, which itself is often solidly frozen up.

On the north-easterly point of Nova Scotia it fur seals are found in abundance.

I have stated that the port for the Atlantic terminus of the Canadian Pacific Railway has not yet been publicly announced. And I may add that, although its present arrangements with the International Railway, form Quebec to Halifax, connect it with the Atlantic at that port, its own shorter and more direct line from Montreal to such seaboard is not yet completed. When finished, as it soon will be, the distance between the two oceans, by rail, will be very considerably diminished. The great project now in hand by the Canadian Pacific Railway is the new gigantic railway bridge, across the St. Lawrence, which the company are building at Lachine—a work of equal magnitude with the Victoria bridge, of the Grand Trunk Railway, at Montreal. It is expected that the entire work will be completed in the spring of 1887.

It is stated that the bridge proper will be composed of three 80-feet deck-plate girders, eight spans of 243 feet each, two flanking spans of 279 feet each, four channel spans of 408 feet each, making the total length of the river portion of the bridge 3,550 feet. The steel for the superstructure is being imported from Scotland, and the bridge, when completed, will be one of the finest in the world. The trains of the Canadian Pacific will pass over it to the seaboard, and its traffic thus be rendered independent of the Grand Trunk.

is, however, a harbour as if created by Nature herself especially for this purpose, which is the nearest available port on the continent of America to that of Europe. It is the harbour of Whitehaven, pronounced by Admiral Bayfield, R. N., "to be the best harbour on the whole Atlantic American coast," as it is, so he says, "the nearest available one to Europe."

Admiral, then Captain, Bayfield—the author of the famous Admiralty charts—was commissioned by the British Government, many years ago, to survey the harbours of Halifax and Whitehaven, and report on their respective merits. He did so, and gave to Whitehaven the most unqualified perference. It is nearer Europe by 160 miles than Halifax is, thus saving that distance of dangerous coast navigation. It has the boldest and deepest f water in its three magnificent entrances, and is immediately accessible from the sea, requiring but a mile or two of pilotage, while Halifax requires over twenty, and is surrounded by many dangerous sunken rocks and ledges, as its many ales of wrecks can testify. Whitehaven has never been known to be obstructed by ice, while Halifax harbour has been often frozen over, and the fogs about its entrance are so proverbial as to make it dreaded by mariners. For facilities in coaling, Whitehaven lies almost in the midst of the coal-fields of Nova Scotia and Cape Breton, and its expenses in other respects as a great ocean *entrepot* would be nearly *nil*.

However fast and magnificent are many of those ocean floating palaces for merchandise that now cross the sea, there are some respects in which, I believe, the ocean passenger traffic will, before many years, undergo a complete change—that is, in separating the passenger and mail traffic from the freight. The colossal hulks of 8,000 or 10,000 tons must be filled with freight or they eat their heads off, besides the danger any loss of speed from being to heavily handicapped. Pleasure or business passengers do not generally now take a cargo ship from Dover to Calais, or Folkestone to Boulogne, or Holyhead to Kingstown, nor do they prefer a heavy-laden freight train, by railway, to the Flying Dutchman or Lightning Express; and when a fast line of ocean steamers, built to carry only the mails and passengers, is put between Milford Haven, in Wales, and White haven, in Nova Scotia, the directors of all other Atlantic lines of steamers which hope to carry passengers will discover the truth of these assertions about cargo ships and freight trains and passengers may reasonable expect to make an average journey and voyage between the great centres of business or pleasure in Europe and America of but little over, if not even inside of, five or six days, with more comfort and far less apprehension of danger or disaster than they can at present.

QUEBEC FOREST.

The annual report of the Hon. W. W. Lynch, Commissioner of Crown Lands and Forests of the Province of Quebec has been presented to the Legislature.

A correspondent of the Montreal *Gazette* thus summarizes a portion of it:—

In the course of the year the Government decided, in view of the repeated applications which have been made to that effect, to offer to public competition a certain number of timber limits on the Ottawa river, north of Lake Tamiscamingue, in a tract designated as block A, previously granted to the North Shore Railway Company. After publication of the proper notices, the sale took place on the 25th February, 1885. Twenty-three limits comprised within the tract in question, and containing a series of 1,044 square miles, were put put up to auction at upset prices varying from $70 to $365 per square mile. A number of those present thought fit to refrain from offering any advance upon these prices. Consequently only four limits, comprising 204 miles, were disposed of for the sum of $58,128, equivalent to an average bonus of $282.95 per square mile. In regard to the prevention of forest fires, it is a matter for regret, at least in respect of this Province, that the project which was conceived some years ago has been allowed to be first carried out by Ontario. The success obtained there is such as to induce reflection on the part of our large limit holders, and the Minister is inclined to believe that after having taken communication of the remarks of the honorable Commissioner of Ontario, these gentlemen will not lend a deaf ear, as they have done hitherto, to the propositions which it is his intention shortly to address to them. The total cost of the service for 1885 was $7,911, of which sum one-half has been refunded by licensees, leaving the net cost of this service to the department to be $3,955.50. It has been disparagingly said, in certain circles especially devoted to the consideration of important questions connected with forestry, that the information we possess respecting the extent and character of those lands of our Province which still remain covered with timber, is very uncertain and almost useless. In order to meet this deficiency, it is proposed shortly to have all the information which can be collected upon this subject exhibited upon certain regional maps soon to be published. The careful explorations which have lately been undertaken and successfully carried out in the Gaspe territory, and in that comprising the counties of Rimouski and Temiscouata, will enable the work to be begun with those regions. It is proposed to have similar explorations made in other parts of the Province during the coming summer, so that we shall before long be in possession of a sufficient amount of detailed and precise information to enable us to form a correct idea of the forest resources remaining at our disposal.

The depressed condition of the lumber trade and the general uneasiness manifested in business circles during the fiscal year ended on the 30th of June last, as well as during that immediately preceding it, had, as was to be expected, a most unfavorable influence upon the revenue of my department. This stagnation seems to have reached its extreme limits, and from the signs of activity now everywhere apparent the Minister looks with confidence for the return of more prosperous years. The cut of timber during the winter of 1884-5 was a little larger than that of the preceding winter, and from information received from the different agencies of the Province he is led to believe that the number of logs made during the present season will exceed that of last year by at least 10 per cent. The manufacture of square timber will be small, which, from a certain point of view is not be regretted; but that of other timber will be more than sufficient to make up for the deficiency. The statement of the receipts of the department shows a more favorable result than was expected, the total collections exceeding the estimates by $21,

633.66. The Minister regrets to state that, notwithstanding the frequent appeals made to purchasers and the liberal offers of remission of interest, the receipts from Crown Lands were much less than they should have been. A considerable number, however, completed their payments, and the number of perfect titles granted in the form of letters patent during the twelve months ended on 30th June last was very little less than that of those issued during the similar period preceding.

ORIGIN OF WOOD TURNING LATHE.

The date of the invention of the wood saw and the turning lathe cannot be given, as they are older than our so-called civilization, or even the chronicling of years by man. The saw is undoubtedly older than the lathe, the latter being a mechanical appliance denoting a considerable advance on the path of civilization. In the "Flint age" of the archæologist, the earliest acquaintance we have with man, flint saws are found along with knives, scrapers, hammers, axes and arrow heads, the teeth of which are in some cases alternately chipped from contrary sides to give set to the teeth. Instruments with jagged edges for cutting wood would be amongst the first productions of man when the use of metals was discovered. Connected with the sawing of wood it is interesting to note that we have the old personal names of sager, jager, and jagger, from the Scandinavian or Teutonic sag, a saw. The wood turning lathe down to a century ago was a very different thing from the lathe of to-day. In its old form it represented a high antiquity; this was the pole or dead centre lathe. In this lathe the piece of wood required to be turned was secured in two centres fixed in two movable pieces of wood known as puppets, or poppets. The puppets were fastened at the distance from each other required by the size of the work in hand. When the piece of wood to be turned was fixed between the centres a cord was passed around it twice or thrice; one end of the cord was secured to the treadle, and the other to a spring pole affixed to the ceiling. By pressing the treadle a rotary motion was imparted by the cord to the wood it was desired to turn. When the pressure on the treadle was released the spring pole caused the wood to revolve in a contrary direction. Hence it was only possible to use the cutting tools half the time. This is the reason this form of lathe has dropped out of use except at High, Wycombe and other chair-making places where it is used along with the rotary lathe. An illustration of such an original lathe is given in the *Encyclopædia Britannica*, nineth edition, xiv. 323.—*Timber Trades Journal.*

A PEEP AT A PORTION OF THE OTTAWA VALLEY.

As the traveller proceeds on the C.P.R., from Mattawa westward, traversing the township of Papineau, Calvin, and Bonfield, he will not be very favorably impressed with the appearance of the land contiguous to the track. The railway in passing through these townships, runs for a distance of 25 miles quite near the Mattawa River, whose banks are very rocky and rough, and if he should base his judgment of the quality of the land in the townships named, on the appearance of such parts as are visibible from the train, he would carry away very erroneous opinions concerning its value. The south half of Papineau presents some good land, where, with ordinary industry, a large number of families could obtain an ample subsistence. A very good road runs from Mattawa to the western boundry of this township, along which are located already a considerable number of families who appear to be doing well. At the terminus of this road will be found a large farm in a high state of cultivation, on which is situated the depot of Messrs. Hurdman & Lloyd, lumbermen. Should the travellers alight at Mackey's mills and follow the Amable du Fond river and its tributaries westward and southward, through the townships of Calvin and Bonfield, he will discover a large tract of excellent land. The soil is generally composed of yellow loam of a very rich quality, which, when first sown, imparts to all kinds of grain a growth of straw so heavy as to fall by its own weight. The second crop is generally regarded by the farmer as better than the first on this account. There are about 400 families settled in those two townships, and they generally express their entire satisfaction with the product of their farms. Clearing is comparatively easy in many parts of there townships, because the primitive forest has been destroyed by fire, but it is a question open to discussion, whether or not the bush fires which swept away the forest, leaving the land ready for seed at a trifling cost to the farmer, did not at the same time greatly reduce the fertility of the soil. On arriving at Calendar, a station on the C. P. R., situated not far from Nosbonsing lake, he may, on ascending a neighboring promontory command a magnificent view of that body of water, which is about twelve miles long and two wide, and which abounds in the finest quality of fish. The lands drained by Nosbonsing and its tributaries are embraced in three townships, Bonfield, Ferris and Chisholm. No finer land can be found in the district of Nipissing than that portion of those townships which surrounds the lake to a distance of several miles in the interior. A few farmers are located here and they are doing well. The soil is generally of a yellow loam with clay bottom in this locality. There is a large amount of land not located yet in the territory described, especially in the township of Chisholm and along the Wisawasa river, which rises twenty or thirty miles south of Lake Nosbonsing and falls into South East Bay on Lake Nipissing, where J. R. Booth's mills are located. This territory is regarded as most favorably situated for settlement on account of the fact that the Northern railway bounds it on the west and the C. P. R. on the north.—*Nipissing Times.*

INVESTING IN CANADA.

Col. M. Jeffers, of East Saginaw, was in the city yesterday, having just returned from an extended visit to Canada. Discussing business affairs in that country he said:—

"I have bought from parties in Canada 500,000 acres, or 20 townships of standing white pine. The land is situated on Georgian Bay, and upon the Serpent, Spanish and Mississaque rivers. There is upwards of 2,000,000 of feet of timber upon the tract. It is all white pine. There is no Norway pine in that region. I have paid a large sum upon the purchase, and would not sell out for a big advance. I have been engaged in the business of buying pine lands for the most of my life and think that nothing outside of the Saginaw valley was ever seen like this whole Georgian Bay country, full of good pine. It is far superior to the Wisconsin or Lake Superior pine. I think this is the biggest transaction that has taken place in pine lands in Canada. Upon the property at the mouth of the Serpent river there is a saw mill that cuts 40 000,000 a year; it costs $250,000, has gang saws and every convenience, including an iron steamer and a tow of barges. There is a good harbor at the mouth of the Serpent river, with wharves, etc. The barges take the lumber to Chicago, Buffalo or any other port on the chain of great lakes. It is delivered precisely as cheap as if from the mouth of the Saginaw river. The whole plant cost the former proprietors nearly $400,000.

"The Canadian Pacific railroad is on the northern boundary of the tract. A spur runs down through it, built to afford rail shipping facilities from the mill itself. I think no land could lay better both for rail and water transportation. It is well cut up by lumbering streams. Gov. Alger has a large amount of timber in the middle of these limits south of us. Col. Bliss, of Saginaw, is also interested in the same region. We propose to bring the logs over and saw them in Michigan. We are Michigan men, and hope to make our purchases inure to the benefit of our people here. Notwithstanding our investments in Canada we still hold by protection for Michigan lumber, unless we have reciprocity or free trade applied to all articles of commerce between the two countries."—*Detroit Free Press.*

WOOD PRODUCTS IN CHEMISTRY

I appears from the experiment of M. Senff, that the yield of crude pyroligneous acid, tar, charcoal, and gas is almost the same with the most different woods. But the richness of the acid waters in acetic acid, and consequently the yield of dehydrated acid, vary greatly. In this reepect the wood of coniferous trees is the least valuable. The wood of the trunk furnishes more acid than that of the branches. The wood yields more acid than the bark, and sound wood more than dead wood. Rapid calcination yields more gas at the expense of the condensed products and of the charcoal; it yields also the weakest acid waters, and the charcoal is more hygroscopic than that furnished by a gradual action.—*Timber.*

Gold in the Rocky Mountains.

Reports from the Selkirk range of the Rocky Mountains in British Columbia state that gold has been found in the beds of all the streams running from the eastern slope of the Selkirks into the Columbia river. On Canyon Creek, lying a few miles south of junction of the Kicking Horse and Columbia rivers, several parties were to be seen washing gold from the bed of the creek, and making good wages. Further down the river were three mining camps, with men in each, preparing new flumes for placer mining. They acknowledged that two of their party had a few days previously washed out $25 worth of the precious yellow metal in one day. Mineral prospects there, both placer and quartz, are said to be superior to anything seen before in these parts.

MAIL CONTRACT.

SEALED TENDERS, addressed to the Postmaster General, will be received at Ottawa until noon, on FRIDAY, 14th MAY, for the conveyance of Her Majesty's Mails, on a proposed contract for four years, six times per week each way, between

BOBCAYGEON & PETERBORO'

from the 1st JULY next.

The conveyance to be made in a Waggon or Steamboat, via Bridgenorth and Ennismore.

The Mails to leave Boycaygeon daily, Sundays excepted, at such an hour as will ensure arrival at Peterborough in time for the despatch of the mails by the afternoon train to Port Hope.

Leave Peterborough as soon as possible after the arrival of the morning train from Port Hope and to arrive at Bobcaygeon in four and a half hours afterwards.

Printed notices containing further information as to conditions of proposed contract may be seen, and blank forms of tender may be obtained, at the Post Offices of Boccaygeon, Bridgenorth, Ennismore and Peterborough, and at this office.

DAVID SPRY,
Post Office Inspector.

Post Office Inspector's Office, Barrie, 8th April, 1886.

NOTICE.

SEALED TENDERS, addressed to the undersigned, and endorsed "Tender for Indian Supplies," will be received at this office up to noon on TUESDAY, 20th APRIL, 1886, for the delivery of Indian Supplies during the fiscal year ending 30th June, 1887, consisting of Flour, Bacon, Beef, Groceries, Ammunition, Twine Oxen, Cows, Bulls, Agricultural Implements, Tools, &c. duty paid, at various points in Manitoba and the North West Territories.

Forms of tender, giving full particulars relative to the supplies required, dates of delivery, &c., may be had by applying to the undersigned, or to the Indian Commissioner at Regina, or to the Indian Office, Winnipeg.

Parties may tender for each description of goods (or for any portion of each discription of goods) separately or for all the goods called for in the Schedules.

Each tender must be accompanied by an accepted Cheque in favor of the Superintendent General of Indian Affairs on a Canadian Bank for at least five per cent of the amount of the tenders for Manitoba and the North-West Territories, which will be forfeited if the party tendering declines to enter into a contract when called upon to do so, or if he fails to complete the work contracted for. If the tender be not accepted the cheque will be returned.

Tenderers must make up in the Money columns in the Schedule the total money value of the goods they offer to supply, or their tender will not be entertained.

Each tender must in addition to the signature of the tenderer be signed by two sureties acceptable to to the Department, for the proper performance of the contract.

In all cases where transportation may be only partial by rail, contractors must make proper arrangements for supplies to be forwarded at once from railway stations to their destination in the Government Warehouse at the point of delivery.

The lowest, or any tender, not necessarily accepted.

L. VANKOUGHNET,
Deputy of the Supeintendent-General of Indian Affairs.

Department of Indian Affairs.
Ottawa, 3rd March, 1886. 6d5

Perhaps the most extraordinary that success has been achieved in modern science has been attained by the Dixon treatment for Catarrh Out of 2,000 patients treated during the past six months, fully ninety per cent. have been cured of this stubborn malady. This is none the less startling when it is remembered that not five per cent. of the patients presenting themselves to the regular practitioner are benefitted, while the patent medicines and other advertised cures never record a cure at all. Starting with the claim now generally believed by the most scientific men that the disease is due to the presence of living parasites in the tissues, Mr. Dixon at once adapted his cure to their extermination; this accomplished the Catarrh is practically cured, and the permanency is unquestioned, as cures effected by him four years ago are cures still. No one else has ever attempted to cure Catarrh in this manner, and no other treatment has ever cured Catarrh. The application of the remedy is simple and can be done at home, and the present season of the year is the most favorable for a speedy and permanent cure, the majority of cases being cured at one treatment. Sufferers should correspond with Messrs. A. H. DIXON & SON, 305 King street west, Toronto, Canada, and enclose a stamp for their treatise on Catarrh.—*Montreal Star* 1y122.

THE CANADA

LUMBERMAN

DEVOTED TO THE LUMBER AND TIMBER INTERESTS OF THE DOMINION.

PUBLISHED SEMI-MONTHLY BY THE

Peterborough Review Printing and Publishing Company (Limited), Peterborough, Ont.

Terms of Subscription:

One copy, one year, in advance	$2 00
One copy, six months, in advance	1 00

Advertising Rates:

Per line, for one year	$0 90
Per line, for six months	50
Per line, for three months	30
Per line, for first insertion	10
Per line, for each subsequent insertion to 3 mo's.	05
Cards not occupying more than 12 lines (1 inch) per annum	8 00
Cards not occupying more than 12 lines (1 inch) for six months	5 00
Cards not occupying more than 6 lines per annum	5 00
Cards not occupying more than 6 lines, for 6 mo's	3 00

Special rates will be made for page, half page and column advertisements.

Advertisements intended for insertion in any particular issue should reach the office of publication at least four clear days before the day of publication, to insure insertion.

All communications, orders and remittances should be addressed and made payable to THE PETERBOROUGH REVIEW PRINTING AND PUBLISHING COMPANY (LIMITED), Peterborough, Ont.

Communications intended for insertion in the CANADA LUMBERMAN, must be accompanied by the name of the writer, not necessarily for publication, but as a guarantee of good faith. Communications to insure insertion (if accepted) in the following number, should be in the hands of the publishers a week before the date of the next issue.

The CANADA LUMBERMAN is filed at the Offices of MESSRS SAMUEL DEACON & CO., 154 Leadenhall Street, London, England, who also receive advertisements and subscriptions for this paper.

PETERBOROUGH, Ont, MAY 1, 1886.

SCIENTIFIC FORESTRY.

IN the report by Prof. Wm. Saunders, F.R.S.C., to the Dominion Minister of Agriculture, on agricultural colleges and experimental farms it is satisfactory to find that the important subject of forestry has not been neglected. In fact in the letter of instructions directing Prof. Saunders to make the investigations on which he founds his report he was especially required to pay attention to the subject of forestry, particularly in regard to tree-planting in the Western States.

As the result of his investigation Prof. Saunders has to report that in many of the States particular attention is given to practical and theoretical forestry in some cases with very beneficial results. The central government at Washington is also evidently alive to the importance of this matter, and makes a not unsubstantial provision for it. Very briefly he records, too, what different European countries are doing in this respect. Especially valuable is the communication which he embodies from Mr. B. E. Fernon.

In the suggestion which Prof. Saunders also makes as part of his duty, he utilizes the information thus obtained. Though the primary object in view is the promotion of scientific agriculture, he shows himself not unmindful of the forest wealth of Canada, or of the necessity for conserving it. In his suggestion for the staff of the proposed colleges and experimental stations he includes a Superintendent of Forestry with appropriate duties. At the stations in the Northwest especially he advices the reservation of blocks of land for forestry purposes.

It is to be hoped that these and other suggestions which have not been particularized, will be adopted, for they cannot fail to be useful. The Dominion Administration, not only as the central authority of our country, but also as having control of important timber tracts and of extensive prairies, part of which might well be devoted to forest, can very appropriately undertake this work.

UPPER END OF OTTAWA VALLEY.

In a second article on the upper end of the Ottawa valley the Nipissing *Times* says:—Twenty-four miles west of Northbay by the C. P. R., you approach the Sturgeon river. A large and turbulent stream which flows into Lake Nippissing, and whose banks, until recently, have been untrodden by the lumbermen. At a point situated four miles above its mouth that river presents some very picturesque scenery. There are the celebrated Sturgeon Cascades, which are an object of interest to both pleasure seekers and capitalists. There also is the singular gorge cut in the rock, as if done by art, through which the waters of a great river rush with terrific velocity, in a volume only thirty five feet wide. It is at the latter that the C.P. R. crosses the Sturgeon by means of an iron bridge, which, owing to the peculiar conformation of the river's banks, was erected at a comparatively trifling cost. There, likewise, is the basin below the last fall where the river spreads out into a lake surrounded by high banks and covering an area of a mile in circumference. An intelligent travellor will linger here to enjoy the pleasure arising from gazing on one of the loveliest scenes found on the shores of the Nipissing. This is the site of the village of Sturgeon Falls, whose commencement dates back to 1882. It possesses about three hundred inhabitants and is favored with the usual number of stores and public houses in a village of this size. There is erected on the basin described a steam saw mill owned by Mr. Clark, which is daily turning out a considerable quantity of sawed lumber; and there is also a water power saw mill built on the upper rapids and owned by Mr. Martin Russel, which is supplying a large amount of shingles and sawed lumber for the use of settlers; and we are informed that Mr. Thomas Mackey is preparing to build a large steam saw mill on McLeod's Bay, a short distance from the village, where are annually shipped, by the C. P. R., large quantities of square timber and saw logs for the lower Ottawa. The township of Springer in which Sturgeon Falls is situated and the township of Caldwell, lying immediately west of the former, which is being rapidly located. Those townships are traversed by two other streams besides the Sturgeon, viz., ; Widow river and Cache creek, in the valleys of which lands of superior quality are found. On ascending the Sturgeon river ten miles, you reach the township of Field which, although reported to be one of the best townships in the district of Nipising, has not a settler located at the present time.

THE MISSION TO LUMBERNAN

An important though unostentatious form of mission work to lumbermen has been carried on for several years by the Presbyterian Church. In order to make it as efficient as possible it has been trusted to the care and oversight of the Synod of Montreal and Ottawa, within whose bounds this field of effort chiefly lie. The importance of the work among those engaged in the lumber woods is at once apparent when their peculiar circumstances are taken into account. A large number of the men employed in lumbering shanties come from all parts of the Province of Quebec and others from Eastern Ontario. They are freed from all restraint of home influence. There are the long evenings when time hanges heavily on their hands. Sabbath is not a working day in the lumber camp, neither are its sacred hours devoted exclusively to religious worship. Much miscellaneous work is done on that day. It is almost inevitable that the moral atmosphere of the camps is not of any elevating kind, and those who while at home have been trained to detter things receive evil impressions that linger in memory.

The committee having charge of the lumbermen's mission, as they have opportunity, send ministers and catechists to the shanties in winter. The missionaries are provided with religious and instructive literature, which is gratefully received and carefully read by all who receive it. At the recent meeting of the Synod of Montreal and Ottawa it was stated that in many cases the illustrated and other periodicals had passed from hand to hand and had been carried to distant regions where they continued to be read by many who could not have been reached otherwise

Another encouraging feature connected with the mission is the kind and cordial welcome accorded the missionaries. They have to undergo arduous and sometimes dangerous journeys in travelling from camp to camp. They have literally to endure hardship as good soldiers of Jesus Chsist, yet in few instances indeed do they meet with anything approaching rude treatment from those they visit. The Old, Old Story is generally listened to with respectful interest. The door stands wide open to the missionary, and great good may confidently be expected from his labour of love among this too much neglected class.

Hitherto the work has to a large extent been sustained by members of the congregations in Ottawa, though others have given liberally to its maidtenance. Under the judicious management of the Convener, the Rev. Dr. Moore, of the Bank Street Church, Ottawa, whose resignation of the office was unanimously regretted, the mission has prospered; but all who spoke in the Synod appeared to be impressed with the conviction that still more vigoroug egort on the part of the Synod is required to make the mission what it ought to be.

It was resolved to apply both to the Home Mission Committee and the Board of French Evangelization for grants to aid in extending the operations carried on by the mission lumbermen, and also to appeal to the congregations with the bounds of the Synod for collections to help forward the work. There is no doubt that finacially and in other respects the new Convener, the Rev. W. D. Armstrong, of Ottawa, will be able to present a still more encouraging report to the Synod next year.—*Canada Presbyterian.*

CHIMNEY DRAUGHTS.

In order to support the combustion means must be provided for supplying the furnace with a continuous supply of air and for removing the products of combustion. Both of these objects are usually accomplished by the chimney, the products of combustion in their heated state being lighter than the external air tend to rise through the flue, and drawing air through the furnace, supply the required oxygen, the remainder, with the products of combustion, passing off in their turn, and, by reason of their lightness, to maintain the draught.

It frequently happens that a draught which has been sufficient becomes impaired and unable to do what is required of it. The first and most natural cause which is looked to in this dilemma is obstruction, by the accumulation of soot in the flues and passages. If this soot is also deposited in the tubes and upon the heating surfaces of the boiler it diminishes the efficiency of the coal which is burned by interposing itself as a non-conducting coating between the fire and the water which it is designed to heat, rendering necessary the consumption of more coal requiring a stronger draught, which the passages in their choked condition are unable to supply.

Leaks in the chimney and masonry about the boiler have a decided and prejudical effect upon the draught, not only from the fact that air enters at those places which would otherwise come through the grates, but the air so entering is cold and heavy, and increases the weight of the column of air in the chimney instead of reducing it as it would in is rarified condition after passing through the fire.

Care should be taken in making more than one connection to a flue, first to have the leading flues so conducted that one may not have a decided advantage over the other, and second, that they do not enter the stack in such a manner as to interfere with each other. When flues enter a stack directly opposite to each other, deflecting plates should be provided in order that the entering currents may not oppose each other. In large stacks with flues entering upon all sides a cone is sometimes built in the centre of sufficient height to serve as a deflector.

The draught of a chimney is, of course, affected by the character of a boiler which is attached to it, and of the flues or passages through which the heated gases are conveyed to in. A return tubular boiler of equal area of cross section in the tubes will require a stronger draught than a vertical tubular, and the vertical will require a stronger draught than a plain cylinder boiler. In cases where, as it is frequently happens in city blocks, the boilers are situated in front and the chimney in the rear, a long and tortuous flue, sometimes decending, is used, allowance must be made not only for the increased friction of the flue itself, but for the heat which will be radicated from it, and which would otherwise assist in sustaining the chimney draught.

We have heard the statement made that the draught of a chimney was decreased by the sun shinning upon it, and we have read the most profound arguments to the effect that it was retarded in some way by the actinic rays acting down upon it. If any such effect is produced by this circumstance we should be inclined to lay it to the lightening of the external column of air rather than any direct retardrtion of the inner one.—*Boston Journal of Commerce.*

RAISING OAK TREES.

During the last few years large quantities of acorns have been taken from this country for the purpose of planting. White oak acorns are preferred and they have been chiefly obtained in the State of Missouri. They are generally planted on sandy or broken land that is intended for pasturing sheep. In Great Britian sheep are accustomed to eat acorns, and it is considered profitable to raise them for sheep food. No variety of oak has received much attention at the hands of the planters of fruit trees. They state that the trees make a very low growth and for this reason they prefer to plant trees that grow rapidly and furnish fuel and timber in a shorter time. A foreign writer suggests the oaks may be raised to excellent advantage in connection with other varieties of trees that grow rapidly. He admits that oaks grow slowly while they are young, but states that they increase in size rapidly when they are fifteen or twenty years old. He, therefore, recomends planting a row of oaks between rows of quick growing trees. The latter will be large enough to use for various purposes when they are from fifteen to twenty years old. If care is exercised they may be cut down so as not to injure the young oaks. These trees being removed, the young oaks will grow rapidly and completely occupy the ground. Oaks are easy to propagate as the acorns can be obtained at small cost and are almost certain to germinate. Acorns are much easier to manage than large nuts like those produced on the hicory or pecan tree. They can be planted where it is desired to have them grow, or in nursery rows, from which the small trees may be taken up when they are at a suitable size to de transplanted. The wood is excellent for fuel, timber and post.—*N.O. Times Democrat.*

Seasoning Green Wood.

Green wood cannot be properly seasoned or dried in five days, any more than green cheese can be ripened in that time, yet each of the nine lumber-drying kilns at the Pullman Car Works has a capacity to turn out 300,000 feet supposed to be fit for car-building, in the above time. It is pretty generally acknowledged that kiln-dried timber must be injured in fibre, and so roasted on the outsides as to be brittle and unfit for many purposes. At least this is what a Chicago carriage journal thinks.

A NEW department, says the Deseronto *Tribune*, was added to the ship yard during the past winter, viz. the manufacture of railway cars. Besides building a number of flat cars, Mr. Evans has repaired several passenger cars, and is now building a smoking and express car for the N., T. & Q. Railway. It is now well advanced towards completion and experts pronounce the workmanship in every respects superior both in strength and finish. A passenger coach will be next attempted and the work of building cars will then become one of the industries of Deseronto, and give additional employment to many workmen. Mr. Evans intends proceeding with the erection of a car shop which will be 85 feet long and 36 feet wide. There will be two tracks, one for framing, &c., and the other for painting &c.

A DISASTEROUS bush fire is now progressing in Canterbury, N. H. Five hundred acres have been burned over. Some of the land had some valuable standing timber, and the loss will be heavy. A large force of men is fighting the fire.

SEASONING TIMBER.

Though air drying is the best and most certain way of promoting durability in wood without impairinng its strength, the time it takes is often a great draw back; hence the immersion of the newly-felled timber is resorted to in order to arrest any tendency to change, by washing out of the pores of the wood all sap and other substances which tend to promote fermentation, and hence decay. Moreover, the soaking in water makes the wood less liable to twist and warp in subsequent drying, and when it is cut up into scantlings for use, be ides rendering it more proof against the attacks of worms, though its strength is supposed to be slightly diminished thereby, which seems to be borne out by the fact that the loss of weight is greater in waterseasoned wood than when it has been merely air seasoned. If placed in water it is better that it should be completely submerged, as nothing is so injurious to timber as being exposed to alternate wet and dry. The generally received opinion is, that for ordinary purposes a fortnight's immersion in runnig water is sufficient, though much must depend on the size of the bulks so treated. T. de Lapparent, one of the Government inspectors of timber in France, recommends for timber used in shipbuilding one year's immersion in river water, two years in fresh, or three in brackish water, constantly being changed, to be followed by two years of air-seasoning. The gradual processes of air and water seasoning are the only ones which can be safely applied to timber in large scantlings; still, artifical drying may often be successfully employed in the case of smaller scantlings, more especially in the preparation of timber for joinery, for which purpose it should be quite dry and free from any tendency to shrink.

Amongst such systems we may mention drying in ovens or hot chambers, exposed to currents of air raging from 90° for hard woods and large sections, to 200° for soft woods in thin boards, the process being carried on until the wood has lost from one-fifth to one-third of its original weight, according to the purpose for which it is required to be used. Boiling and steaming wood for three or four hours are often resorted to, as the subsequent drying is thereby rendered very rapid, and the tendency to shrink and twist is reduced to a minimum, whilst the wood becomes so pliable that ribs and planks can be bent to any required curve, and, if confined until dry, will readily retain the form so given them. Smoke-drying may also be employed at times with advantage; but carbonising or charring the outer surfaces of the wood, though very effectual in preserving it from the destructive influence of alternate wet and dry, such as the ends of posts let into the ground are so much exposed to, must never be regarded as a substitute for seasoning; for though keeping out external moisture, it effectu ally imprisons that which is in the pores of the wood, and so hastens internal decay. While on this subject it may be as well to observe that paint, tar, and all similar waterproof coatings are only preservatives so long as the timber is already seasoned and free from moisture, as then they keep it dry; but if not, they become the most certain agents of destruction. For imperfectly seasoned timber the best preservative against the weather is a rough-swan face, which forms a shield against both sun and rain, and at the same time offers no check to the evaporation of the moisture from the poers of the wood.—*Timber.*

A Remeni-ence.

A strange tragedy, that took place twelve years ago in the lonely woods of the North Shore of Lake Huron, is told in the Manitoulin *Expositor* of April 10. Seven men in employ of Williams & Murray, lumbermen, of Blind River, while taking up a load of oats and provisions in a boat to an inland station camped one raw night in Spring on the banks of the river. To shelter them from the wind they piled the bags of oats in a dyke, behind which they lay down to sleep. The dyke topled over during the night smothering them all. Mr. Murray found their dead bodies on the fatal spot three days after

THE length of the short line to be construct ed by the C. P. R. from Smith's Falls east is 121 miles.

NEW YORK.

The following is the official list of the prices obtained at the New York Lumber Auction Company's sale at New York on April 13th :—

Lot 1—White pine shelving, ⅞ inch, 12,829 ft. $18.

Lot 2—Ash, 1¼ and 1½ inch, firsts, 3,401 ft; seconds, 5,247 feet; culls, 434 feet, $27.

Lot 3—Hemlock joists, 2½x4x13, 924 pieces, 13 cents each.

Lot 4—Walnut and cherry, 1 inch, walnut firsts, 291 ft.; seconds, 2,113 ft.; culls, 4,617 ft.; cherry, 69 ft. $47.

Lot 5—White pine shelving, ⅞ inch s 2 s 3,615 ft. $18.50.

Lot 6—Chestnut, 1 inch, firsts 101 ft.; seconds, 3,160 ft.; culls, 982 ft. $14.

Lot 7—Chestnut, 1 inch, firsts, 389 ft.; seconds, 2,-791 ft.; culls, 913. $15

Lot 8—Chestnut, 1 inch, firsts, 340 ft.; seconds, 2,710 ft.; culls, 325 ft. $15

Lot A—Chestnut, 1 inch, culls, 10,785 ft.; $9.50.

Lot 9—Whitewood, 1¼ and 1½ inch, firsts 5,177 ft.; seconds, 3,541 ft.; culls, 250 ft. $29.

Lot 10—Hemlock joist 2½x4xI3, 937 pieces. 13½ cents each.

Lot 11—Whitewood squares, firsts, 569 ft.; seconds, 1,072 ft.; culls, 978 ft. $17.50.

Lot 12—Cherry, 1¼ in., Ash, 1½, 2 and 3 in., Walnut 5x5 and 6x6 inch. Cherry culls 69 ft. Ash, firsts and seconds 114 ft., culls 31 ft. Walnut, firsts 111 ft.; seconds, 33 ft.; culls 64. $33.

Lot 13—Whitewood, ⅜, ⅝ inch; firsts 145 ft.; seconds (planed) 1,607 ft.; culls (planed) 1,949 ft. $11.

Lot 14—Whitewood, 1 inch, firsts 2,593 ft., seconds, 7,064 ft.; culls 935 ft. $25.

Lot 15—White pine, 2 inch, box pine 7,526 ft. $15.50.

Lot 15½—White pine, 1½ inch W.P. cutting up stock, 4,224 ft. $23.

Lot 16—Whitewood, 1 inch; firsts, 173 ft.; seconds, 1,413 ft.; culls, 4,503 ft. $16.50.

Lot 17—Whitewood, 2 in.; firsts, 5,208 ft.; seconds, 3,796 ft.; culls, 437 ft. $29.

Lot 18—Whitewood, 3 inch; firsts, 1,596 ft.; seconds, 1,852 ft.; culls, 205 ft. $28.

Lot 19—Whitewood, 1 inch, culls, 13,084 ft. $16

Lot 20—Walnut squares, 794 ft. $51.

Lot 21—Whitewood, 1¼ and 1½ inch; firsts, 3,858 ft.; seconds, 2,528 ft.; culls, 80. $28.

Lot 22—Whitewood, 2 in., firsts, 3,405 ft.; seconds, 2,755 ft.; culls 52 ft. $22.50

Lot 23—Hemlock boards, 1x12x13, 644 pieces. 13½ cents each.

Lot 24—Box pine, 2 inch, 8,182 ft. $15.

Lot 25—Ash flooring, 1 inch, T. & G. planed one side. ⅞ inch No. 1 ash flooring, 11,133 ft. $23.50.

Lot 26—Hemlock boards, 1x10x13, 924 pieces. 12½ cents each.

Lot 27—Walnut, 1 and 2 in., firsts, 45 ft; seconds 844 ft.; culls, 4,866. $38.

Lot 28—White pine 1 in. W. P. No. 2 cutting up stock, 13,208 ft. $24.

Lot 29—Whitewood, 4 in., firsts, 4,118 ft.; seconds, 2,494 ft.; culls, 275 ft. $32.50.

Lot 30—Hemlock boards, 1x10x13, 800 pieces. 13 cents each.

Lot 31—Walnut, 1 inch, firsts 144 ft.; seconds, 1,333; culls, 1,855 ft. $44.

Lot 32—Walnut 1 in., firsts, 195 ft.; seconds, 1,757; culls, 2,363 ft. $43

Lot 33—Whitewood, 2 in., firsts, 1,609 ft.; seconds, 2,638 ft.; culls, 996 ft. $22.

Lot B—Walnut Planks, 2, 2½, 3, 3½, 4 and 4½ inch, firsts, 1,056 ft.; seconds, 1,802 ft.; culls, 785 ft. $90.

Lot C—Walnut squares, 4x4, 5x5, 6x6, 7x7 and 8x8 inch, firsts, 1,002 ft.; seconds, 1,227 ft.; culls, 1,240 ft. $75.

Lot 34—Whitewood, 1½ in., firsts, 2,029 ft.; seconds, 655 ft.; culls, 30 ft. $30.50.

Lot 35—Whitewood, 3 in., firsts, 3,508 ft.; seconds, 2,764 ft. $30.50.

Lot 36—Whitewood, 1¼ and 1½ in., firsts 3,965 ft.; seconds, 3,582 ft.; culls, 649 ft. $28.50

Lot 37—Whitewood, 1 inch, culls, 15,478 ft. $14.50.

Lot 38—W. P. Shelving, extra wide, planed 2 sides, ⅞ W. P. Shelving pl 2 S— 16,751 ft. $18

Lot 39—Walnut, 1 inch, seconds, 959 ft.; culls, 1,-928 ft. $44.50.

Lot 40—Walnut, 1 inch, seconds, 1,042 ft.; culls, 2,-092 ft. $46.

Lot 41—Walnut, 1 inch, seconds, 1,498 ft.; culls, 1,-666 ft. $50.50.

Lot 42—Whitewood, 1 inch, culls, 4,151 ft. $14.50.

Lot 43—Whitewood, 1 inch, culls, 4,243 ft. $14.50.

Lot 44—Whitewood, 1 inch, culls, 4,106 ft. $14.50.

Lot 45—Whitewood, 1 inch, firsts, 1,283 ft.; seconds, 3,580 ft.; culls, 2,687 ft. $26.

Lot D—White pine shelving, extra wide, planed 2 sides, ⅞ inch, 18,159 ft. 2 M $21.50, 2 M $21.50, 1 M $20, 5 M $19.50 and 8,159 at $19.00.

Lot 46—Whitewood, 2 inch, firsts, 1,086 ft.; seconds, 1,744 ft.; culls, 684 ft. $25.50.

Lot 47—Whitewood, 3 inch firsts, 5,453 ft.; seconds, 1,909 ft.; culls, 315 ft. $30.50.

Lot 48—Walnut, ½ to 4 inch, culls, 2,313 ft. $26.

Lot E—Whitewood, 1 and 1½ inch, seconds, 566 ft.; culls, 1,415 ft. $23.

Lot 49—Whitewood, 1¼, 1½ inch, firsts, 1,121 ft.; seconds, 2,088 ft.; culls, 1,050 ft. $24.

Lot 50—Walnut, 1, 1¼ and 1½ inch, firsts, 32 ft.; seconds, 738 ft.; culls, 2,532 ft. $40.

Lot 51—Walnut, ⅝ inch, firsts, 693 ft.; seconds, 945 ft.; culls, 1,638 ft. $27.50.

Lot 52—Whitewood squares, firsts, 2,651 ft.; seconds, 978 ft.; culls, 628 ft. $25.

Lot 53—White pine shelving, planed two sides, ⅞ inch. 17,175 ft. $17.

Lot 54—Walnut, 1 and 2 inch, firsts, 2,082 ft.; seconds, 4,285 ft.; culls, 524 ft. $75.50.

Lot 55—White pine flooring, T. & G. planed one side, ⅞ inch, 14,466 ft. $16.

Lot 56—Hemlock joist, 2½x4x13, 660 pieces. 12½ cents each.

Lot 57—Whitewood, 1 inch, seconds, 792 ft.; culls, 3,233 ft. $18.50.

Lot 58—Whitewood, 1¼ and 1½ inch, firsts, 2,228 ft.; seconds, 1,930 ft.; culls, 144 ft. $27.50.

Lot F—White ash, 1 inch, firsts, 5,190 ft.; seconds, 2,595 ft.; culls, 56 ft. $34.50.

Lot 59—Whitewood, 1½, 2, 2½ inches, firsts, 6,815 ft.; seconds, 1,518 ft.; culls, 184 ft. $31.

Lot 60—Whitewood squares, firsts, 2,647 ft.; seconds, 531 ft.; culls, 72 ft. $29.50.

Lot 61—Whitewood, 1 to 2 inch, firsts, 3,060 ft.; seconds, 2,218 ft.; culls, 189 ft. $26.

Lot 62—Walnut, 1 and 2 inch, culls, 8,655 ft. $38.50.

Lot 63—Wide pine shelving, planed two sides, ⅞ inch, 16,905 ft. $14.50.

Lot 64—Quartered sycamore, 1, 1¼, 1½ inch, firsts, 1,214 ft.; seconds, 627 ft.; culls, 152 ft. $34.75.

Lot 65—Whitewood, 1 inch, firsts, 2,381 ft.; seconds, 4,606 ft.; culls, 1,628 ft. $26.

Lot 65½—Whitewood, 1, 1¼ and 1½ inch, firsts, 5,058 ft.; seconds, 3,337 ft.; culls, 729 ft. $27.75.

Lot 66—Whitewood, 1½ in., firsts, 9,747 ft.; seconds, 1,600 ft.; culls, 49 ft. $31.

Lot 67—Walnut, 1, 1½ and 2 in., seconds, 261 ft.; culls, 1,173 ft. $32.

Lot 68—Whitewood, ⅜ inch, firsts, 2,871 ft.; seconds, 4,244 ft.; culls, 5,103 ft. $17.50.

Lot 60—Hemlock boards, 1x12x13, 624 pieces. 14 cents each.

Lot 70—White pine, 1 inch, W. P. No. 2, cutting up stocks, 12,251 ft. $18.50.

Lot 71—Oak timber, 5x12 inch, firsts, 5,627 ft.; seconds, 2,745 ft.; culls, 665. $27.50.

Lot 72—Whitewood, 1 inch, culls, 14,499 ft. $14.25.

Lot 73—Roofing boards, 1x10 D. & M. 14,107 ft. $16.50.

Lot 74—Basswood, ½ inch, culls, 9,612 ft. $7.00.

Lot 75—Ash Balusters, 4 295 pieces 2x2, clear, and 1,323 do., 2½x2½, clear. 4¼ cents each.

Lot G—Cherry Balusters, 831 pieces, 2x2, and 189 do, 2½x2½, clear. 5 cents each.

Lot 76—Ash, 1½ inch, firsts, 1,285 ft.; seconds, 3,766; culls, 351. $26.

Lot 77—Whitewood, 1, 1¼ and 1½ inch, firsts, 1,594 ft.; seconds, 2,194 ft.; culls, 964 ft. $21.50

Lot 78—Whitewood, 1, 1¼ and 1½ inch, firsts, 1,459 ft.; seconds, 2,001 ft.; culls, 770 ft. $20.50.

Lot 79—Whitewood 1½ inch, firsts, 4,790 ft.; seconds, 3,479 ft.; culls, 500 ft. $26.

Lot 80—Ash strips, 1 inch, clear, 2,648 ft. $23.

Lot 81—Ash strips, 1 inch, clear, 3,139 ft. $23.50.

Lot 82—Ash strips, 1 inch, clear, 4,187 ft. $23.

Lot 83—Walnut, 1 inch, firsts, 63 ft.; seconds, 813 ft.; culls, 697 ft. $51.

Lot 84—Cherry, 1 and 1½ inch, seconds, 174 ft.; culls, 214 1½ in., and 7,299 ft. 1 in. $19.

Lot H—Whitewood culls, 1 inch, 11,007 ft. $14.25.

Lot 85—White ash, 1 inch, firsts, 2,934 ft.; seconds, 1,629 ft.; culls, 165 ft. $34.

Lot 86—White ash, 1 inch, firsts, 2,197 ft.; seconds, 995 ft. $34.

Lot 87—Walnut, 1 inch, firsts, 2,400 ft.; seconds, 5,-459 ft.; culls, 223 ft. $73.50.

Lot 88—White ash, 2 inch, firsts, 6,752 ft.; seconds, 3,637 ft.; culls, 106 ft. $32.75.

Lot 89—Quartered white oak, 1 inch, firsts, 6,654 ft.; seconds, 2,407 ft.; culls, 483 ft. $44.

Lot 90—Basswood, 1½ inch, firsts, 378 ft.; seconds, 1,692 ft.; culls, 1,630 ft. $13.

Lot 91—Basswood, 1¼ inch, firsts, 688 ft.; seconds, 1,425 ft.; culls, 982 ft. $13.

Lot 92—Basswood, ½ in., firsts, 780 ft.; seconds 1,-820 ft.; culls 982 ft. $13.

Lot 93—Whitewood, 1 inch, firsts 6,319 ft.; seconds, 2,642 ft. $13.50.

Lot 94—Whitewood, 1 inch, firsts, 3,779 ft.; seconds, 1,122 ft. $32.

Lot 95—Whitewood, 1 inch, firsts, 6,788 ft.; seconds, 2,834 ft.; culls, 343 ft. $34.50.

Lot 96—White pine 1½ inch cutting up stock, 12,-836 ft. $17.

Lot 97—Whitewood, 2 in., firsts, 4,433 ft.; seconds, 4,216 ft.; culls, 1,858 ft. $26.

Lot 98—Whitewood, 1 in., firsts, 1,567 ft.; seconds, 5,954 ft.; culls, 3,250 ft. $22.50.

Lot 99—Hemlock boards, 1x10x13, 740 pieces. 12¾ cents each.

Lot 100—White pine flooring, ⅞ in., T. & G. planed one side, 14,378 ft. $16.

Lot 101—Whitewood, ⅝ in., firsts, 1,942 ft.; seconds, 8,930 ft.; culls, 6,345 ft. $15.

Lot 103—Whitewood, ⅝ in., firsts, 2,986 ft.; seconds, 4,496 ft.; culls, 282 ft. $20.

Lot 104 Walnut, 1, 1½, 2 and 2½, firsts, 2,585 ft.; seconds, 4,525 ft. culls, 394 ft. $70.50.

Lot 105—Hemlock boards, 1x12x13, 600 pieces. 13 cents each.

Lot 106—Ash, 1 inch, firsts, 5,168 ft.; seconds, 3,-870 ft.; culls, 256 ft. $34.50.

TUG FOR SALE

Now on Georgian Bay. Gross tons, 55.99; Length, 70 feet; Breadth, 15 feet; Depth, 8 feet. Was Re-built last Summer. Apply to

FOR SALE

VALUABLE

Timber Limits

AND

50,000 SAW LOGS

ON SEVERN RIVER

The undersigned being desirous of confining their operations to their Lakefield Mills on the Trent waters, offer for sale the following Limits :—

Township of Hindou, 70 square miles.
" Oakley, 45 " "
" Redout, 22 " "

An area of 137 square miles.

These limits are estimated to contain 180 million feet of Logs, well watered, and afford means of short hauling from all points, and quick and cheap driving to Georgian Bay. Are offered for sale together with plant, depots farms, 1,200 acres deeded lands and 50,-000 logs, nearly all of which are on the main river, a large proportion of which are 16 feet long. Apply to

R. & G. Strickland,

3mL LAKEFIELD, ONT.

PATENTS

PROCURED in Canada, the United States, England, France, Germany Austria, Belgium, und all other countries in the world. Experts in all Patent Causes.

A CANADIAN SCHOOL OF FORESTRY.

The Toronto *Globe's* London correspondent says :—Some renewed discussion has taken place here recently of Prof. Fream's suggestion to the effect that an Anglo-Canadian Forest School might be established with advantage. Professor Fream's proposition, it may be remembered, was that with aid from the Imperial treasury the Canadian Government might establish a Forest School, which would not only be a great benefit in promoting forest preservation in Canada, but would also prove extremely serviceable as a means of training for English students in forestry. Several communications on the subject have appeared in *The Canada Gozette*, and these have now been supplemented by editorial reference in *Forestry*, the medium for the consideration of such matters in this country. The present time is in ways specially opportune for action on the part of the Dominion Government. The Select Committee, nominated last year by the House of Commons, to report upon the desirability of establishing Imperial schools of forestry, will very shortly be re-appointed, and the whole subject will before long be brought prominently under the notice of the Imperial authorities. Prof. Fream proposes that the Canadian Government should take the matter in hand at once by securing the services of one or two thoroughly trained practical foresters who might acts as inspectors in the suggested school, and to whose care the management of large areas of forest land might be entrusted. In this way the valuable efforts of the Ontario Government to promote forest preservation would be most usefully and fittingly supplemented, and Canada presents such exceptional advantages over the old country for sylviculture that a very strong case could unquestionably be made out for Imperial support. *Forestry* commends the proposal, and expresses the hope that some action in this direction may shortly be taken. Cannot the matter be effectively brought under the notice of the Dominion authorities during the present session of Parliament? If their views were ascertained, and were found to be in any degree favorable to the suggestion, reports could then be made to the Imperial Government.

TIMBER FOR CAR BUIDING.

The effect of the increased activity in car building upon the prices of lumber used for sills, says an exchange, is significant as an indication of a future scarcity and a permanent advance in prices. It is true that during the past three years railroads have, as a matter of economy, made their old car equipments last as long as possible without incurring the expense of renewals. The time, however, has come when the old stock must be replenished to meet the requirements of existing traffic, to say nothing of any prospective increase of traffic which is likely to attend a general revival in business. The simultaneous demand for new cars for a large number of roads that have been starving their stock may give a stimulus to the lumber market that may turn out to be merely temporary, to be followed by easier prices as soon as the stock at the yards shall be increased to meet the demands.

This, however, remains to be seen. Certain it is that the sources of supply of the most desirable timber in the construction of cars are not becoming more abundant or nearer of consumption. White oak was once considered indispensable for sills, truck frames, any part of a car exposed to severe strains, but its growing scarcity and the demand for it and other lines of construction have led to the use of Norway southern yellow pine, of which there is a more abundant supply at less cost. These timbers have of late been extensively used for freight car sills of every kind, especially at the south, and stand the test for service, except for end sills, practically as well as oak. Southern pine that has not had its strength and solidity impaired by tapping, is very stiff and durable. The further south it grows the more resinous, heavy and serviceable it is, and along with Norway pine is likely to be a staple material for car sills as long as the supply lasts and prices are not prohibitive. But even should the increase cost exceed the limits of economy, as it probably will in the course of time, there are other woods as yet but little used in car work that will become available. Spruce has already been tried, and if the testimony in its favor is reliable it makes excellent sills. Hickory is also spoken of by those who have used it, and there may be other woods, as yet untried, that may be found equally well adapted to the purpose.

Furthermore, there is no telling to what extent timber preserving processes may be developed under the spur of economy. Chemical treatment, it is true, might not add very much to the strength of a sill to resist strains, but moisture might be excluded and decay and rot prevented, which would, of course, prolong the service. Paint is now relied upon to do this and would do it more effectually than it does if it was applied more frequently and thoroughly.

As a last resource, when the forest shall be thinned to the point of extinction, we shall have the ore beds and smelting furnaces to fall back upon, and iron cars will at least become a necessity, their cheapness and durability will be recognized, and the weary waiting of their many sanguine advocates abundantly rewarded. But, we are sorry to say, both cars and advocates must bide their time, which is not yet.

MICHIGAN LUMBERMEN AND OUR FORESTS.

Canadians are not generally aware of the extent to which the Michigan lumbermen are securing the best timber limits in the Georgian Bay district. We reprint to-day from the Detroit *Free Press* an interview with Col. Jeffers, a Michigan lumber merchant, in which that gentleman mentions that he has purchased 500,000 acres of timber land in Canada. Col. Jeffers is only one of many Michigan lumbermen who are buying up as rapidly as possible our western forests in order to replace the disappearing Michigan ones.

Of course of Michigan lumbermen choose to pay the necessary price, they cannot be kept from acquiring our lands; but the Government has in its own hands the power of preventing the constant loss to Canada which accrues from the possession of these limits by the Michigan lumber merchants. They all have mills at Saginaw, and as the United States Government does not impose a tax on saw logs, they raft them across Lake Huron, and saw them in Michigan, thus giving to foreigners that employment which should in justice go to our own workingmen. Col. Jeffers in his interview said :—

"We propose to bring the logs over and saw them in Michigan. We are Michigan men, and hope to make our purchases inure to the benefit of our people here."

We, in turn, propose that the Canadian Government should spoil the little game of Col. Jeffers and his compatriots by placing heavier export duties on logs. They would then be obliged to either utilize the present Canadian saw mills, or erect new ones. In either case they would have to expend in this country thousands of dollars which at present go towards building up Saginaw. Of course it would be rash to take any action pending the consideration by Congress of the Hewitt Bill, which provides for the removal of the present American duty on sawn lumber, but if that measure should be rejected, the Canadian Parliament should not for a moment hesitate about increasing the export duty on logs. Self-preservation is the first law of nature.—*Ottawa Journal.*

THE OTTAWA RIVER FLEET.

The first barge of the season to be loaded is one which commenced receiving a cargo of match blocks at Pattee & Perley's dock yesterday morning for Prince's splint factory at Buckingham Basin. The barge is the John Neville, commanded by Capt. Beaton.

Steamer Allen Gilmour, Capt. Bangs, and tow of six barges will likely load laths at the end of the week at Bronson and Weston's docks.

Steamer George A. Harris and tow of seven barges will take on a cargo of lumber early next week for American ports, at Eddy's, Booth's and Perley & Pattee's.

Steamer E. B. Eddy, Capt. Williamson, and tow of six barges will start to load at the end of the week at E. B Eddy's wharf.

Messrs. D. Murphy & Co.'s large fleet of 67 barges will begin loading next week for Montreal, Quebec, Whitehall, N. Y., and Burlington.

Steamer Thousand Island Rambler is now being put in readiness and will start ferrying between Hull and Ottawa next Monday.

Steamer Gatineau, of the Merchants' Despatch Line, will load for Montreal at the beginning of next week on the Ottawa river, and proceed to Montreal, returning with a cargo of merchandise destined for this port.

Steamer Ida, Capt. Garrett, which has been improved to a large extent, will be launched from Miller's shipyard early next week, and will go through to Mentreal, returning with merchandise and passengers for Ottawa and intermediate ports on the canal between this and Kingston.

Steamer Express, Capt. Mansfield, will recommence the ferry service for the season between New Edinburgh and Gatineau Point early next week.

On Monday or Tuesday next the tug Sir John and tow of five barges will load lumber for Oswego.

Steamers Hiram Easton and Resolute, and steam barges Welshman, Water Lily, and Col. By, with their respective tows of barges, will be ready to lock down light from the canal into tne Ottawa river about the 5th of May.

The repairs to the Rideau Canal here are being rapidly pushed forward under the able supervision of Mr. Carrol. It is calculated that it will be ready for traffic the first week in May.—*Journal April 21st.*

A SAW MILL IN A QUEER PLACE

Among the old jokes that called in question (very absurdly) Mr. Jefferson's practical sense was one to the effect that he built a sawmill on the top of a mountain, and had finished it before he thought where the power was to come from or how the logs were to be got to it. One is reminded of this when, in passing westward over the Chesapeake and Ohio Railway, just below Sewel, he casts his eye to the top of the mountain opposite, towering up five or six hundred feet, and sees a sawmill perched up there, like an eagle upon its eyrie. As of the fly in the amber, he will ask, "how the devil did he get there?" Mr. A. M. Donelson, a Scotchman, conceived the idea. He moved a thirty or more horse power engine on the road to Cotton Hill, and thence around through Fayette, to its wonderful perch. With one or two other engines of less power he is sawing up a large quantity of fine oak and poplar, and transporting it to the Chesapeake and Ohio road. But in what way, is the funny part of it? Shouid your attention be called to it, otherwise you eye would hardly catch sight of an immense wire cable fastened at or near the mill, and the other end close to the Chesapeake and Ohio road, spanning the awful chasm. Then the timber enclosed in an iron frame is suspended by a swivel to the cable, with a big rope or cable fastened to one end of it and so played out as to regulate the decent, is somewhat the description an intelligent young man on the cars gave me. I should have deemed myself lucky to see a carload in transitu. It reminded me of the picture in my geography when an urchin, of a man in Peru or Chili suspended over one of the awful cliffs by a rope hunting for birds eggs.—*Ex.*

SEASONING TIMBER.

Though air drying is the best and most certain way of promoting durability in wood without impairinng its strength, the time it takes is often a great draw back; hence the immersion of the newly-felled timber is resorted to in order to arrest any tendency to change, by washing out of the pores of the wood all sap and other substances which tend to promote fermentation, and hence decay. Moreover, the soaking in water makes the wood less liable to twist and warp in subsequent drying, and when it is cut up into scantlings for use, besides rendering it more proof against the attacks of worms, though its strength is supposed to be slightly diminished thereby, which seems to be borne out by the fact that the loss of weight is greater in waterseasoned wood than when it has been merely air seasoned. If placed in water it is better that it should be completely submerged, as nothing is so injurious to timber as being exposed to alternate wet and dry. The generally received opinion is, that for ordinary purposes a fortnight's immersion in runnig water is sufficient, though much must depend on the size of the bulks so treated. T. de Lapparent, one of the Government inspectors of timber in France, recommends for timber used in shipbuilding one year's immersion in river water, two years in fresh, or three in brackish water, constantly being changed, to be followed by two years of air-seasoning. The gradual processes of air and water seasoning are the only ones which can be safely applied to timber in large scantlings; still, artifical drying may often be successfully employed in the case of smaller scantlings, more especially in the preparation of timber for joinery, for which purpose it should be quite dry and free from any tendency to shrink.

Amongst such systems we may mention drying in ovens or hot chambers, exposed to currents of air raging from 90° for hard woods and large sections, to 200° for soft woods in thin boards, the process being carried on until the wood has lost from one-fifth to one-third of its original weight, according to the purpose for which it is required to be used. Boiling and steaming wood for three or four hours are often resorted to, as the subsequent drying is thereby rendered very rapid, and the tendency to shrink and twist is reduced to a minimum, whilst the wood becomes so pliable that ribs and planks can be bent to any required curve, and, if confined until dry, will readily retain the form so given them. Smoke-drying may also be employed at times with advantage; but carbonising or charring the outer surfaces of the wood, though very effectual in preserving it from the destructive influence of alternate wet and dry, such as the ends of posts let into the ground are so much exposed to, must never be regarded as a substitute for seasoning; for though keeping out external moisture, it effectually imprisons that which is in the pores of the wood, and so hastens internal decay. While on this subject it may be as well to observe that paint, tar, and all similar waterproof coatings are only preservatives so long as the timber is already seasoned and free from moisture, as then they keep it dry; but if not, they become the most certain agents of destruction. For imperfectly seasoned timber the best preservative against the weather is a rough-swan face, which forms a shield against both sun and rain, and at the same time offers no check to the evaporation of the moisture from the poers of the wood.—*Timber.*

How to Skeletonize Leaves.

First dissolve four ounces of common washing soda in a quart of boiling water, then add two ounces of slaked lime, and boil about fifteen minutes.. Allow this solution to cool; afterwards pour off all the clear liquid into a clean saucepan. When the solution is at a boiling point, place the leaves carefully into the pan and boil the whole for an hour. Boiling water ought to be added occasionally, but sufficient only to replace that lose by evaporation. The epidermis and parenchyma of some leaves will more readily separate than others. A good test is to try the leaves after they have been gently boiling for about an hour, and if the cellular matter does not easily rub off betwixt the finger and thumb beneath cold water, boil them again for a short time. When the matter is found to be sufficiently softened, rub them separately, but very gently, beneath cold water until the perfect skeleton is exposed. The skeletons are at first of a dirty white color; to make them of a pure white, and, therefore, more beautiful, all that is necessary is to bleach them in a week solution of chloride of lime.—*Timber Trades Journal.*

CHINA offers about as attractive a field for the work of professional explorers as any other country on the globe. It has recently been ascertained that the Chinese coal-fields occupy an area of four hundred thousand square miles.

POWER TRANSMISSION.

One of the most deplorable circumstances connected with practical mechanics, says the St. Louis *Miller*, is the wanton carelessness in the adjustment of shafting, gearing, belts and all means of transmitting power. As has been repeatedly stated in these columns but a mere fraction of the heat unites represented in a ton of coal is utilized, by far the larger portion consumed in overcoming friction (some of which is more than useless), supplying the deffciency caused by petty leaks and the like. These of themselves appear to be and really are small matters of themselves, but taken in aggregate they amount to more, by a large majority, in the consumption of power than is represented by the force really utilized. The first practical idea to be impressed on an apprentice is the saving of patience, time, labor and profits by a neat adjustment of the minor parts of machinery, and more especially all knuckles, joints, cogs, belts and the like. If we take a new belt so cut and joined that it runs evenly over both pullies, we will find that, so far as these two wheels are concerned, all the friction to be overcome is by the adhension on the arc of the surface contract. Now if we unlace the belt and cut off a tapering, wedgeshaped piece from one end and draw together, we will find that the belt is of unequal lengths on each side, and, of course, it bears harder on one side of the pullies than the other, so that one side has all the work to do, and, in accordance with the law governing this motion, the belt is attempting to adapt itself to these applied unequal forces, a side motion is introduced, begetting another, and the hardest kind of friction to come, viz., a sliding motion across the pulleys when in motion. This motion not only occurs on one pulley, but on both, and every inch of the belt, however long and wide, partakes of this motion, the friction of which in some cases amounts to nearly if not quite as much as that needed to propel the machine. As a consequence the boilers is put to extra work, the engine labors fearfully in doing half its estimated work, and the entire machinery drags, the belt shows early evidences rapidly, and innocent parties are blamed, when, in reality, the fault lies with the carelessness of the one who sewed the belt.

Again, a system of belt tighteners and idlers are rapidly coming into use, that not only increase the work demanded of the machinery, but of themselves are fearful consumers of power by being improperly hung, so that they augment the evil intended to be overcome. A tightener or idler should be so adjusted that the point of contract, friction and motion is as perfect for the service required as the drum pulley; but very often it is thought that any appliance, however crude and ungainly, will do for a tightener, and that they are placed in position with no regard to the proper distance from the drum or pulley, and with still less reference to the difference in size of the two. There is a wrong as well as right way of doing this, but we see the former oftener than the latter.

PROTECTION OF FORESTS.

The Forestry Commission, of New York, at a recent meeting in Albany, adopted some rules and regulations for the protection of the forests from destruction from fire. They are as follows:—

FIRST.—All persons having occasion to burn a fallow or start a fire in any old chopping, wind slash, bush or berry lot, swamp, "viale," or beaver meadow, for the purpose of clearing or improving, shall give five days' notice of such intention to the nearest Fire Warden, Forester, or agent of the Forest Commission. He shall also give notice to any neighbors who may have fields or woodlands adjacent, and liable to injury, at least one day previous to the setting of such fires. Such fires will be permitted only when the wind is favorable, and competent persons must remain on guard until the fire is completely extinguished on the surface and in the "duff."

SECOND.—All hunters, fishermen, loggers, guides, tourists and others lighting fires, in or near the forest for cooking, warmth, insect smudges, or other purposes, must clear away all combustible material from within six feet of the place where the fire is to be kindled, and must thoroughly stamp out, drench, or otherwise extinguish any such fire upon leaving it either temporarily or permanently; and hunters using firearms with inflammable wadding are hereby cautioned against allowing fires to start from such causes.

THIRD.—Smokers are cautioned in regard to fires arising from any carelessness of theirs, and their attention is called to the penalty for negligence in causing fires. Parents and teachers are respectfully requested to instruct children to avoid lighting fires in the forests or exposed places.

FOURTH.—Peeling standing trees of their bark for covering camps or shanties is hereby prohibited. For such purposes the tree must be felled, and all the available bark removed therefrom before another tree is cut down. The trees thus cut down must be utilized for firewood, and such fallen timber as lies in the vicinity of the camp must also be used for fire wood before any green standing timber is cut for that purpose.

THE COAL FIELDS OF NEW SOUTH WALES.

The coal-beds of New South Wales are of enormous extent. The mineral has been traced for hundreds of miles along the coast, and has been worked at various levels from 450 feet below to 1,500 feet above the sea. The lower beds are geographically older than any that have been yet worked in Europe, and the quality of the coal which is taken from these inferior strata is therefore unsurpassed. Not only so, but in certain districts immense seams of this mineral are found in immediate juxtaposition with an abundance of iron ores, limestone and fireclay. Hence nature seems to have indicated New South Wales as the great manufacturing colony of the Australian group. Up to the present time, coal has been ascertained to exist over an area of something like 25,000 square miles of country; and it is almost everywhere within easy reach of water and railway communication. Now, when it is remembered that the coal-fields of Britain only cover one-twentieth part of the area of the country, or about 4,000 miles, and that nevertheless the output of this mineral in the mother country is upwards of 120,000,000 tons per annum, it would be difficult to overestimate the magnitude of the proportions to which the coal trade of New South Wales may be expected to grow hereafter.

IMPERIAL FEDERATION,

A circular has been recived at this office from the London, England, Chamber of Commerce, giving the conditions prescribed in connection with a prize of £50 offered for the best essay on Imperial Federation and how it can be practically carried into effect. The essay should treat only with practical suggestions, may be written by any British subject, should not exceed in length twenty-five pages of foolscap and have a margin of two inches on the left and be written on only one side of the paper, must be in the hands of the secretary of the chamber, at 84-85 King William street, London, E. C., by August 31st, 1886, and must have a motto or a distinctive character attached, and a sealed envelope must be sent having a similar motto on the exterior, but having the writer's name inside. "Imperial Federation Essay" should be marked in the left hand corner of each envelope. The judges are Sir Alex. Galt, G. C. M. G., Prof. J. R. Seeley, M. A., and Mr. James Anthony Froude, and their decision will be final. All essays will become the property of the Chamber and the writer of the best one will receive a prize of £50.

THE South antagonizes the proposition to put lumber upon the free list because that section is now the possessor of the only great forests remaining in the Union. So long as the West had its forests, argue the Southerners, Canadian lumber was kept out, and it is only fair that the South should be similarly treated now. Canadians who look to the future do not covet an increased consumption of our lumber by our neighbors.—*Toronto World.*

LAST year the Rathbun agency at Ottawa shipped 6,000,000 feet of lumber to Oswego.

LUMBER DRIVERS' CALKS

FOR USE IN STREAM DRIVING.

Made from the Best Refined Tool Steel and Forged. The method used in tempering leaves every one of the same temper rendering them stronger and more durable than any other Calks made Samples and prices free on application to the undersigned.

THE

Orono Cant Dog

Strongest and Lightest in the market. Made of Best Cast Steel by drop forging process. The Handles are made of best quality straight grained split and turned Rock Maple, 5 to 6 feet in length, bored specially to suit the pick. Prices on application.

Market Reports.

TORONTO.

From Our Own Correspondent.

APRIL 23.—Sales from the yards continue fair and stocks have been kept up to a fair average. The only grades, or kinds, at all hard to obtain are 1½ cuts and better, and bills cut to order. The latter will soon be easier to fill as most mills will be running as soon as May comes in, and the cut for 1886 will be larger than for some years past. The cut of hemlock also will exceed that of former years. This class of lumber is now coming into more general use, the prejudice existing in the past against this kind of lumber is fast dying out, and if the railway companies would only take a common sense view of the matter, and make a special tariff to to suit this class of lumber there could be a much larger amount placed on the local market, but as it stands now it is quite impossible to freight green cut hemlock by weight at 9 cents per hundred weight. There is large tracts of hemlock yet uncut in localities where the pine is all gone, which would find a ready market under an reduced rate of freight. It is to be hoped that the companies interested will shortly see their way clear to give their customers a reduction on this class of wood, of at least one-third, and they would still come out the gainers.

Vessels are rapidly moving away what dry lumber there was piled on docks here during the winter months. Messrs. Rathbun & Son, of Deseronto, held a large portion of the lumber on the docks, so that a nearly clean sweep will take place when they have shipped out. The firm of Donogh & Oliver have also a large stock on their docks. A large portion of their operations are confined to this market so that they generally fill up as fast as sales are made.

A number of timber vessels have been loading here this week, the constant repetition of their shrill whistles connected with the engines on board have made things seem quite lively. A large amount of elm and ash timber will go to Quebec from here, and some fine line board timber, and had the P. J. Railway started running in time for this season's work, a much larger quantity would have found its way here.

Lath and shingles are now both in fair demand; figures are not, however, as satisfactory as could be wished for. The best paying figures now going on this market is for 18 and 20 ft. bill stuffs, which rules $1.50 per M above 16 ft. lengths. Those prices will, doubtless, be modified when more mills start up.

OTTAWA.

From Our Own Correspondent.

APRIL 24.—The unprecedented warm weather has had the effect of opening up all the streams in this neighborhood, and now the driving of logs and timber is in full blast on nearly all the creeks and small rivers of the Upper Ottawa. In conversation with Mr. D. A. Martin, manager for Messrs. Bronson & Weston, he said that in his thirty years experience he never saw a more favorable season for getting the winter's cut to the market. He had been on an extensive tour through the firm's works on the Upper Ottawa, and while the small streams are all open and the driving is in full progress, yet in the green bush there is fully three feet of snow, and a very heavy coating of ice, so that a most bountiful supply of water is assured. This state of things is shared in all the vast territory of the Upper Ottawa over which the lumbermen have been operating for the past winter, so that the probability is that more logs will be brought to the Chaudiere booms this year than ever before, because all cut will be got safely down, and more left by low water, as is case in the average year past.

On the 26th the mills in this locality all open for the season, which is many days in advance of last year. The most ample preparations have been made for the event and nearly all the mills will run day and night to supply the large orders already booked. For the past few days barges have been loading up with their freights for the south and east, and the hum of the great lumber industry is once more a moving living factor in our midst.

The preliminary survey of the extension of the Canada Atlantic railway to the different lumber yards has been completed and now workmen are busily employed in the work of construction. When the road is completed it will be a great boon to the lumbermen, affording as it will the readiest means of shipment, and will greatly lessen the expense attendant on the handling of the lumber. It is expected that in about two months time the extension will be finished and in working order.

It is feared that our Government is altogether too apathetic in the matter of protecting our forests against the encroachments of the Michigan men, who are quietly getting possession of some of our best lands on the north shore of Lake Superior, as well as in the Nipissing district. They do not seem to realize that the pine growth of that vast region is its chief wealth, and should be protected by an increased export duty on logs. The argument that it is difficult to collect an export duty on logs does not apply to this region at all, for it would be utterly impossible to evade the duty, owing to the means the Americans will employ in transporting their logs to their Michigan mills. As I stated some months ago immense barges are to be employed for the purpose, and as the points at which logs can be shipped in this manner are limited in number the difficulty of appraising the export duty would be confined to the *minimum*, so that but a few Dominion officials would be necessary to carry out the instructions of the Government satisfactorily. There can be no question but if the Government took the precautions which they should take in the matter of protecting our forests for the benefit of our own people, there would be a revolution in things and instead of those logs being sawed by Michigan saws the limit holders would find it advantageous to erect mills on this side of the boundary.

MONTREAL.

From Our Own Correspondent.

APRIL 26.—The lumber market since our last report, and especially during the past week, has been very quiet. It, in common with every other branch of trade, has felt the effects of our unprecedented spring flood. The water began to rise on Friday the 16th inst., and reached its greatest height on Monday; many of the streets in the lower part of the city being covered to a depth of from five to seven feet, some even eight feet. On Tuesday a shove took place, and after that the water quickly lowered.

The demand at the yards has been slight, but a good improvement is expected this week. Car load business, however, has been very fair. The total business done this month was much less than that of March.

Prices remain unchanged.

The following are the quotations at the yards:—

OSWEGO, N.Y.

From Our Own Correspondent.

No change can be made in quotations. The demand has very materially slackened since the labor troubles commenced. We are not free from the evil of the operations of the K. of L. here, one of the M. W.'s appeared here last Sunday and organized a branch, initiated the longshoremen and sailors unions, put three to four hundred dollars in his pocket and left on Monday. This K. of L. business is supporting a few of the leaders in good style at the expense of the poor people from whom the money must come.

CHICAGO.

BY THE CARGO.

The *Northwestern Lumberman* of April 24th says:—During the six days ending with Wednesday, April 21st, 51 cargoes of lumber arrived in port. This showing is sharply in contrast with that of last year for a corresponding week, when there were not half a dozen arrivals all told. During a like week in 1884 there were 98 arrivals.

The lumber that has come by lake thus far has mostly gone direct to the yards. This week one commission house sold two cargoes of Manistee and White Lake green dimension, the ordinary length going at $9.75, and a quantity of 3x12-16 in each cargo selling for $11 and $11.50. A quantity of selects brought $26 a thousand, according to report. Mill culls have been sold on the market, to the extent of several jags, at $7.50 to $8. A load or two of cedar shingles, considerably off grade, were sold, but at private terms. Medium stock has been sold to arrive at prices reported to be $1 better than last year at the season's opening, $14.50 being the price named on some sales.

As yet there have not been enough cargo transactions to make a market. The disposition of the yard dealers is to buy little or nothing for the present. May 1st is the time for taking inventories in the yards. It is now so near that date that few want to take on more stock until the inventories are complete. Besides, it is plain that the jobbers and manufacturers are wide apart in their views. They usually are in the spring, but this year there seems to be less than the usual margin between cargo and yard prices. While this is the case, the yard men now have a strong motive for holding off about making purchases on account of the dubious condition of labor affairs. And, as a matter of fact, there is less dry lumber to be thrown on the market than there was last year. Green lumber will not come forward freely until the mills are all in full blast. Mills that have not already begun operations will not, in most instances, be started before May 1st.

Lake freight rates are on a basis of $1.25 a thousand on dry lumber from Muskegon, $1.37½ from Ludington, and $1 50 from Manistee.

AT THE YARDS.

Trade is but moderate. The urgency of demand that was a feature of March business has departed. The great yards that have to sell lumber or do worse are still sending out long trains, but the yards of smaller capacity are not now making any special effort to crowd sales. The present condition is peculiar. Stocks are so much broken, and values in the yard correspond so nearly with those at the mills that holders of medium sized stocks have no motive to urge business. When they undertake to scalp for assortments they have to pay about as much for lumber as they can sell it for. The outlook is also a little uncertain. Merchants are not sure as to how serious labor disturbances are to be. They also begin to figure on crop prospects, and future prices for farm products. They are simply in a condition of "don't know," and see no loss in waiting until their minds are clearer. At the same time business is moving along in a steady fashion, a large amount of lumber in the aggregate going into distribution. Dry stocks all over the country being broken in assortment, there is a demand, as a matter of necessity, for lumber held in this city. It is going in all directions—often north, right into the heart of producing districts, to patch up assortments.

Receipts of lumber and shingles for the week ending April 22nd, as reported by the Lumberman's Exchange:—

AUSTRALIA.

Messrs. Lord & Hughes' monthly circular, dated Melbourne, March 20th, says:—

Since our last, on 22nd ult., we have to advise the heaviest arrivals of every description of timber and building materials we have ever had in any one month, with the result of lower prices and greater difficulty of making sales, even at such lower prices; the fact is, the trade are so fully stocked that they purchase most reluctantly, their difficulty being enhanced by the inability of obtaining drayage and fire insurance. We can look for no improvement in prices until there is a great falling off in imports.

The trade from the timber yards continues good, with no evidence of any falling off. Builders are all actively employed, and with every prospect of continuing so for some time to come.

The Howard, from Sagueney, with cargo of Canadian lumber for this port, is stranded at Ringarooma Bay, N. E. coast of Tasmania.

RED DEALS.—Imports: 94,332 pieces from the Baltic, and 15,559 pieces from London. The arrivals have been Nanna, Jotun, and Aurora, from Gefle; Albert Ehrensvord, from Gothenburg; Ilos, from Arendal; Atlantic, from Skutskar (via Adelaide;) Lorelei, from Frederickstad; Maulesden, Bankfields, Eusemere, and Marsala, from London. The Albert Ehrensvord's cargo came to the order of one of the trade and has gone direct into stock. The Atlantic's cargo was sold privately, to arrive,

some time ago, prices not transpired. Sales of various shipments were made, prices ranging for thirds, 4⅜d. to 5d. ; fourths, 3d. to 4¼d. per foot 9x3.

SPRUCE DEALS.—Imports: 21,035 pieces. The arrivals have been Ilos and India, from the Baltic ; Sardomene, from New York ; and ex steamers, from Sydney. The Ilos comes to the order of one of the trade, and has gone direct into stock. Sales have been, ex Wave King," General Butler and India, at 3d to 3⅝d per foot 9x3.

OREGON TIMBER —Imports: 2,314,816 feet super. The arrivals have been City of Brooklyn and Lakefield, from Burrard's Inlet ; and Quickstep, from Tacoma. The City of Brook lyn and Quickstep's cargoes have been sold privately, prices withheld. The C. C. Funk's cargo was sold on 2nd inst., from £5 to £5 10s., average £5 3s 10d, per 1,000 feet super ; and on the same date the General Butler's, at from £4 17s 6d to £5 12s 6d, average £5 4s 6d.

LUMBER.—Imports: Clear pine, 89,373 feet super. The arrivals have been, Sardomene and Lucy A. Nickels, from New York ; and Albany, from Adelaide. Offerings by auction have been unusually heavy, and prices show a decline on last month's rates. We quote clear pine at £12 5s to £14 5s ; shelving, £8 to £11 2s 6d ; Canadian white pine, £6 7s 6d to £8 2s 6d.

REDWOOD.— Imports: 323,507 feet super. The only arrival during the month has been the Alice Muir, from San Francisco, which is now in course of landing. The parcel ex C.C. Funk, and balance ex Grace Roberts, were sold at £9 to £8 7s 6d.

FLOORING AND WEATHERBOARDS.—Imports: 12,670,698 feet lineal. The arrivals have been exceedingly heavy, and a considerable decline has to be recorded. We quote—Red, 6x1½, 9s 3d to 9s 9d ; 6x⅞, 7s 9d to 8s ; 6x¾, 6s 6d to 6s 9d ; 6x½, 4s 8d to 4s 9d ; 4-out red weatherboards, 4s 9d ; white, 6x1½, 9s 3d to 9s 6d ; 6x⅞, 7s 6d ; 6x¾, 6s 6d ; 6x4½, 4s 8d to 4s 10d ; 4-out weatherboards, 4s 10d to 5s

KAURI PINE.—Imports: 853,182 feet super. The arrivals have been— Ensign, Presto and Yolandi, from Kaipara. Sales by auction have been of shipments ex Noatun and Cabafeidh, prices showing a decline on last month's rates.

PITCH PINE.—Imports: Nil. A small parcel of 10 in. T. & G., ex Beaconsfield, was offered at auction on 9th inst., but bidding not being up to limits it was withdrawn.

CEDAR.—Imports: 131,900 feet super. This parcel arrived ex Sydney steamers. Special interest was manifested at the sale on the 2nd inst. of the first shipment of logs, ex Diamond, from New Guinea, which sold fairly well from 37s 6d to 11s according to size of logs.

DOORS.—Imports: 1,749. The arrivals have been the Ederside, from San Francisco, via Sydney, and Sardomene, from New York. Both parcels have been placed privately, at satisfactory prices,

LATHS AND PICKETS.—Imports: Laths, 17,983 bundles ; pickets, 5,890 bundles. Notwithstanding the heavy arrivals, prices show an advance on last month's rates.

SLATES.— Imports: 688,170. The arrivals have been — America, from Liverpool ; Wellington, from Launceston ; Sardomene and Lucy A. Nickels, from New York. Imports excessive, and prices have declined fully 10 per cent. on last month's rates.

PLASTER.—Imports: 2,260 barrels. This parcel arrived ex Sardomene and Lucy A. Nickels, and has been sold privately. We quote best brands 12s to 13s.

CEMENT.—Imports : 9,950 barrels. Favorite brands have been sold at up to 13s.

GALVANIZED IRON.— Imports: 537 tons. We report a sale privately of an invoice of Davis' 26 gauge 5-feet to 10-feet, at £16 10s. We quote Orb brand at £16 10s.

EXPLANATION—Red deals and spruce deals are sold at per foot of 9x3 ; T. and G. Flooring at per 100 feet running ; Oregon timber, redwood, clear pine, shelving, ceiling, per 1,000 ft. super ; Kauri pine and cedar logs at per 100 ft. super ; laths, pickets and slates at per 1,000 pieces. Shorts are all lengths under 12 feet.

BEARDEY, CHAMPAIGN & Co.'s mill, at Muskegon lake expect this spring to slice up a log.

LONDON.

The *Timber Trades Journal* of April 17th says :—Messrs. Churchill & Sim's catalogue on Wednesday hardly drew such a big room as we expected. There was a fair gathering, but no crowding, and the stimulus to bidding, which the late opening of the Baltic ports engendered, had been palpably damped by the information conveyed in our Swedish correspondent's letter, published last week, that the ice was thawing rapidly, and the ports were likely to be open a month earlier than anticipated. This is not very cheering news to those who have been acquiring stock at the public sales in the expectation that the month would pass off without any fresh arrivals, and the announcement made that some of the first-open-water steamers were already able to prosecute their voyage could hardly fail to operate unfavorably.

The cypress timber from Wilmington, ex Fidelio, with which Wednesday's sale was introduced, went apparently low. This timber is said to be in good repute in America, where, we understand, they use it, got a wonderful bargain.

The present lamentable cargo prices of pitch pine are partly due to the suicidal policy of Scandinavian shipowners in sending their vessels out seeking to the southern ports, when they must have known by past experience that the shippers would have them entirely at their mercy. Of course this was a great windfall to the shippers, who have no alternative but to look to the low freights to give them a chance of getting out at cost, and would, of course, take every adyantage of these seekers being on the spot to regulate the rates.

The market here is completely glutted on all sides, and, unless the supply is curtailed some way or another, a greater fall in prices will assuredly take place.

When the pine and spruce parcels came under offer, buyers did not betray any more anxiety, and the reputed scarcity of some of the sizes evidently has not been felt in the market yet. As a matter of fact, everybody is full of everything, and we look in vain for the advance so confidently predicted at the nativity of the present year.

The most noticeable feature of the first day's sale was the absence of Petersburg goods, only a little lot of white representing that important wood-shipping place. The interest of the sale seemed to centre around the pine and spruce parcels. The goods ex Kalliope, of the latter description went very low for Quebec stuff ; in fact all the 3rd appeared out of favor. The 9/10 ft. planks ex Betty falling at £5 15s. is a damper for those who are looking to see things improve. However the goods were not the best samples of the port they represented ; and, though we do not wish to convey any false impression to the actual state of values, we doubt not but that if really prime sorts came under offer the result would be less discouraging.

The fact of the market being so overdone with white spruce will remain an incurable evil as long as trade continues at its present dead level, and the big cargo of lower port stuff now discharging in the Surrey Commercial docks could hardly have come to a worse market, unless the great Mersey city had been selected.

The stereotyped phrase—things going very quiet—was applicable to Messrs Churchill & Sim's second day's doings, and it was apparent from the feebleness of prices that the demand had not yet shown signs of improving. The bidding was slow.

The Quebec lots were better appreciated, and the lot of second broads ex Ilos 12 feet, which opened at £11, but eventually fell at £18 (1884 cutting), were not dear. Spruce, like the day before, appeared to hang fire considerably, but, as a buyer remarked, how can it be otherwise when nobody wants any? £6 10s for 3rd Quebec 3x11 is a not very satisfactory record, but, as we did not see the stuff, cannot pronouce it either cheap or dear. Like the rest of the public sales lately, the seller had to hold the worst end of the stick. It is a satisfaction that, if prices are no better, they recede only to a very slight degree, which is an implication that with a genuine inquiry any upward movement will take a solid form.

Stocks at the outports are heavy, and the few sales yet effected to many places must leave a considerable quantity of unplaced stock yet to be dealt with. The leading brands are mostly placed, no doubt, and t› secure their specifications the outports, and probably some of the London trade as weli, have paid the full figures ; but, having suited themselves in this way, they are unlikely to do more till the position of the market is more assured.

LIVERPOOL.

The *Timber Trades Journal* of April 17th says :—Beyond the interest involved in the public sales held during the latter portion of last week, there has been very little animation shown in the market. In the retail trade consumers are evidently still pursuing the same line of business they have followed for months past, and will only take what they want for pressing and immediate wants. In the wholesale branch a similar line of policy seems to be pursued, and therefore the sellers of goods to arrive on contract are having an extremely hard time of it at present, as buyers still continue to exercise the greatest amount of caution in entering into any engagements for the future. They are fortified in adopting this course by the continued depression in the freight market, which still rules extremely low from the St. Lawrence, New Brunswick and Nova Scotian ports, and also from pitch pine ports.

From St. John, N. B , we see that charters to Liverpool have been effected at about 43s 9d per staudard for deals, and 18s and 19s per load for pine and birch timber, respectively, for London 40s. per standard, and the Bristol Channel 41s 3d to 42s 6d per std.

On Friday, thr 9th inst. Messrs. Price & Pierce offered by public auction the cargo of hewn pitch pine timber, just arrived per Cleveland, from Mobile. The inclemency of the weather, perhaps, militated against a large attendance, yet the local trade was fairly well represented, and we venture to think as much was obtained for the cargo as its quality and the present depressed condition of business could have led any one to anticipate.

The parcels per Maracas and Baron Anderson failed to elicit a bid, and consequently weee withdrawn.

Messrs. Farnworth & Jardine's sale of spruce deals on Thurday last was fairly attended by the local trade ; but, from the apathy displayed by those present, it was evident that the company present was attracted more by curiosity than from any desire to buy. This was shown by the fact that lot after lot was passed without eliciting any bid whatever ; the only sales made were :

WOOD-WORKING PATENTS.

The following list of patents relating to the wood-working interests, granted by the United States Patent Office, April 13th, 1886, is specially reported by Franklyn H. Hough, solicitor of American and Foreign patents, 925 F. Street, N. W., Washington, D. C.

339 864—Log turner— W. W. Coyle, Springfield, Ohio.

339,872—Plane, bench—J. P. Gage, Vineland, N. J.

339,877— Planing machine— W. H. Gray, Brooklyn, N. Y.

339,728— Saw, band— E. C. Atkins, Indianapolis, Ind.

339,797—Saw mill, band—J. W. Maxwell, Louisville, Ky.

340,016—Saw swage—A. Stevens, Wausau, Wis.

340,051—Saw tooth—A. Krieger, Columbus, Ohio.

339,808—Shingle machines, feed mechanism for—W. L. Purves, Waddington, N. Y.

PATENTS ISSUED APRIL 20.

340,207 — Lathe — A. Gordon, Hamilton, Ohio.

340,335 — Lathes, work supporter for — E. Zimmermann, New York, N. Y.

340.312—Log skidding and loading machine —H. N. Hewlett, Oscoda, Mich.

340,444— Resawing machine—I. R. Joslin, New York, N. Y.

340,491— Saw mill dog—N. J. Cushman, North Paris, Me.

340,097—Sawing machine, scroll—E. Collins, New York, N. Y.

New Zealand Fungus.

A curious trade has sprung up of late years in a peculiar kind of fungus that grows on the trees in the North Island of New Zealand, and which is exported exclusively to China. The uses to which it is applied do not seem to be well known. In 1837 the British authorities at Hong Kong said it was "much prized by the Chinese community as a medicine administered in the shape of a decoction to purify the blood, and was also used on fast days with a mixture of vermicelli and bean-cured instead of animal food." Subsequent information shows that it is used in soups as ordinary food, and it is also used as a dye. The exports during the past ten years have grown from £1927 to £18,939, but the increase has not been uniform. The gathering of the fungus is probably one of the vagabond industries ; if so the irregularity is easily accounted for. The exports in 4884 were 6387 cwt., valued at £11,079.

Wood Products in Chemistry.

I appears from the experiment of M. Senff, that the yield of crude pyroligneous acid, tar, charcoal, and gas is almost the same with the most different woods. But the richness of the acid waters in acetic acid, and consequently the yield of dehydrated acid, vary greatly. In this reepect the wood of coniferous trees is the least valuable. The wood of the trunk furnishes more acid than that of the branches. The wood yields more acid than the bark, and sound wood more than dead wood. Rapid calcination yields more gas at the expense of the condensed products and of the charcoal ; it yields also the weakest acid waters, and the charcoal is more hygroscopic than that furnished by a gradual action.—*Timber.*

KNIGHT'S PATENT "EXCELLSIOR"

SAW MILL DOGS

The Sawyer's Favorite

For Holding Logs upon a Saw Mill Carriage while being Sawn into Lumber.

These Milldogs I guarantee to give satisfaction in every case. They will hold a frozen log as well as a soft one, for cutting Scantling, Square Timber, &c. These Dogs cannot be excelled, I sell them all on their own merits, give ten or fifteen days trial, and then, if not satisfactory, return them to my order, as I have no agents on the road this year, I will sell them at a reduced price. Send for Circular and price list.

Forewarned

of danger by the condition of your blood, as shown in pimples, blotches, boils, or discolorations of the skin; or by a feeling of languor, induced, perhaps, by inactivity of the stomach, liver, and kidneys, you should take Ayer's Sarsaparilla. It will renew and invigorate your blood, and cause the vital organs to properly perform their functions. If you suffer from

Rheumatism,

or Neuralgia, a few bottles of Ayer's Sarsaparilla will relieve and cure you. Alice Kendall, 218 Tremont st., Boston, Mass., writes: "I have been troubled with Neuralgia, pain in the side, and weakness, and have found greater relief from Ayer's Sarsaparilla than from any other remedy." J. C. Tolman, 336 Merrimack st., Lowell, Mass., writes: "In no other remedy have I ever found such a happy relief from Rheumatism as in

Forearmed

with Ayer's Sarsaparilla, there need be no fear of Dyspepsia, Rheumatism, Neuralgia, Salt Rheum, Tetter, Eczema, Catarrh, Liver troubles, or any of the diseases arising from Scrofulous taints in the blood. Geo. Garwood, Big Springs, Ohio, writes: "Ayer's Sarsaparilla has been used in my family for a number of years. I was a constant sufferer from

Dyspepsia,

but Ayer's Sarsaparilla effected a permanent cure. Seven years ago my wife was troubled with Goitre: two bottles of Ayer's Sarsaparilla cured her, and she has never had any return of the disease. I regard this preparation as the best medicine in use for the blood." B. Barnard Wair, 75 Adams st., Lynn, Mass., writes: "For many years I suffered terribly from Indigestion, Dyspepsia, and Scrofula. Almost hopeless, I took Ayer's Sar-

Ayer's Sarsaparilla

saparilla." It instils new life into the blood, and imparts vitality and strength. Being highly concentrated, it is the most economical blood purifier.

and am a well man to-day." Be sure and get Ayer's Sarsaparilla, the most thorough and effective blood purifier. The best is the cheapest.

FOR THE

Canada Lumberman

IT WILL PAY YOU, BECAUSE :

1. It is the only newspaper published in the Dominion of Canada devoted to the lumber and timber industries.
2. It is devoted to the development and utilization of our forest wealth.
3. It furnishes complete and reliable quotations of prices of lumber in all the leading markets.
4. Its columns are filled with interesting reading matter, valuable alike to the land owner, manufacturer or dealer.
5. It costs only $2.00 per year to have it sent, post-paid, to any address in Canada, and no land owner, lumber dealer, manufacturer or individual in any way connected with timber industries, can afford to do without it.

☞TO ADVERTISERS.

It has a circulation among saw mill owners, manufacturers, lumber and timber dealers and all classes connected with the timber business.

Examine the field, count the cost, and you will at once decide that the CANADA LUMBERMAN is the

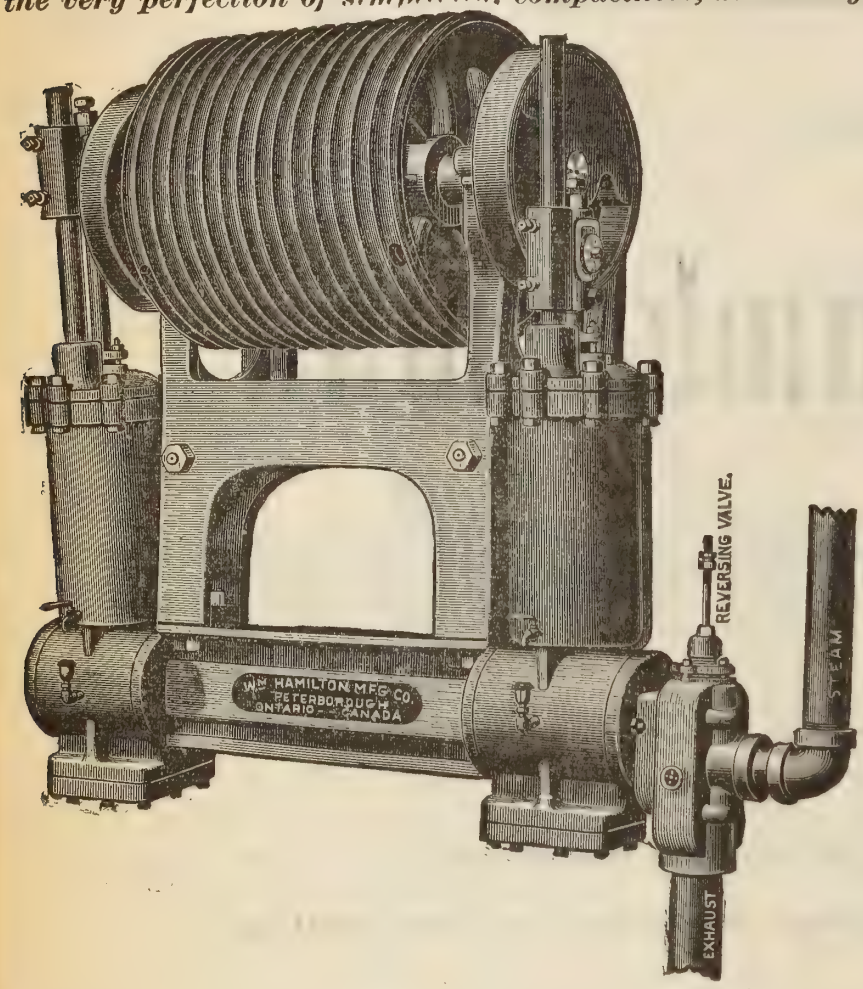
———CHEAPEST, BEST, MOST RELIABLE and ONLY TRUE MEDIUM———

for placing your goods or wares before the saw-mill men and lumber and timber dealers of the Dominion.

CUNNINGHAM'S
PATENT OSCILLATING TWIN ENGINE

FOR STEAM FEED IN CIRCULAR MILLS WITH RACK OR ROPE.

This Engine has practically but two moving parts, aside from cranks and shafts. The whole array of eccentrics, valves, valve rods, connecting rods, cross heads, slides, levers, rock shafts, bell cranks, etc., is done away with, and the very perfection of simplicity, compactness, durability and cheapness attained.



The above engraving illustrates the Twin Engine, 10x16, for Rope Feed, for Saw Mill Carriages. The spool is 27 in. diameter, 30 in. face, is grooved 2 in. pitch for 1½ in. rope. The shaft is steel, 4½ in. diameter, with disk cranks. No connecting rods, eccentrics or valve rods to get loose and out of order. The ports are in the trunions, and worked by an oscilliation of the cylinders, and are held in their place in the downward motion by a steam cushion below. The sawyer's valve is a perfect balance, and by moving this valve the engine can be reversed, stopped or started almost instantaneously if necessary, as the sawyer has perfect control of it by his lever either to go fast or slow. Should the sawyer let go of his lever either by mistake or any other cause, it is balanced so that the valve will come to the centre and cut the steam off both cylinders and stop the feed. When standing, the lever is locked or fastended, so that is is impossible for it to start off itself. The engine stands upright below the carriage, and bolted to two upright beams, placed on the mill for the purpose. When a rack is preferred in place of the rope, we put on a steel wheel 30 in. in diameter, and the engine placed high enough to work into the rack on carriage bar, or if the beams come in the way, an idler wheel can be used between engine and rack segs; or, the engine can be placed at a distance and have a shaft from it to the carriage; or it can be placed in the engine room, where it is under the control of the engineer for oiling, thence by shaft and pinion to carriage rack bars. These engines are well adapted for cutting long logs, or where the logs are mixed, the advantage of this feed will be apparent to mill men. When the carriages are used in two or more sections, the couplin and uncoup ling of each section is quick and simple.

There were two of these feeds working this summer and giving the best of satisfaction, one with rope feed at James Playfair & Co's Mill, Sturgeon Bay, near Waubaushene, and one at the new mill furnished by us to Francis Carswell & Co., at Calabogie Lake, on the Kingston and Pembroke R. R. This mill is working with the Rack and Pinion feed, and drops from fifteen to seventeen stock boards per minute. We have also sent one to the Rathbun Company, Deseronto, to put in to feed their heavy Circular Mills. They will also commend themselves for various other cases, especially for running Elevators, hoisting Engines, and wherever a simple and easily reversible motion is required.

We would also call attention to our Improved Band Saw-Mill for cutting logs

☞ ***We guarantee this to be the best Mill of its kind got up, and would ask any one wanting a good Band Saw-Mill to communicate with us. We would also call the attention of Mill Men to our new IRON GANGS, CIRCULAR MILLS and MILL MACHINERY. For further information, prices, &c., address the Manufacturers,***

IMPROVEMENT ALL ALONG THE LINE.

Three years ago there was an oversupply of white pine lumber. The mill of the Northwest had been run to their greatest capacity, curtailing of the logs or lumber supply had not been seriously considered, and the result was loaded markets, both at primary and distributing points. Such a condition, in any line of trade, has but one result—unremunerative prices. Every dealer and manufacturer was anxious to dispose of his stock. There was competition as to who should get rid of the greatest amount of lumber in the shortest possible time. Drummers were accorded the liberty to sell as their judgment might dictate, and that invariably means a meeting of as low prices as other drummers make, and often cutting a little under them. There was complaint everywhere that the business of manufacturing lumber, on the whole, was not sufficiently profitable, and stock for the yards of the jobbers was sent out at low figures because it could be replaced at lower prices. The situation was one that, while it pleased the jobber and retail dealer, was discouraging to the men who owned stumpage and saw mills.

In the South little mills had gone in, which were operated by men of small means. These men, in many cases, did not regard their business as permanent, that is, they put their mills in for the time being to cut off small tracts of timber that was accessible to a railroad, and when that was accomplished intended to trust to luck and get possession of another small tract if possible. In such a business the incentive was to sell their lumber, about as fast as sawed, for what it would bring. They were unable to hold their lumber until it was fit for shipment. Necessity compelled them to get rid of the product of their mills as fast as possible, and while it is said that a nimble sixpence is better than a slow shilling, the sixpence in this case did not go to profit account. Many of these small mill operators had neither the means nor disposition to visit the leading markets, and consequently knew little of the market requirements. This was another fact that compelled them to sell cheaper than they would have been obliged to had their stock been properly manufactured. Such a state of affairs was a constant menace to manufacturers who understood their business, and who had the means to take advantage of the situation.

Such were the conditions three years ago, but now we find them materially different. The white pine men called a halt and changed their tactics. They rightly concluded that it was foolish, from a business standpoint, to crowd the market; that trade would be much healthier and profitable if lumber buyers were forced to seek the manufacturers instead of the manufacturers the buyers. As it is impossible to turn out a big stock of lumber from a small stock of logs, and as a large stock of logs had in the history of the lumber business almost invariably meant a large stock of lumber, they concluded that the proper way to begin curtailment was at the stump. It was believed by many that all talk about reduction was so much buncombe. Certain operators, however, meant what they said. There was such a lessening of the log cut in the seasons of 1883-84 and 1884-85, that at the end of the sawing season of 1885 nearly all the logs in some of the streams were made into lumber, with the further favorable exhibit that the output of lumber in 1885 showed a decrease of 11 per cent. as compared with that of the previous sawing season. This has been brought about by the stiffening of the backbone of the manufacturer. He has finally decided that his pine timber is good property; that at the most he has altogether too little, and that it will be better for him, and for his children who will inherit his possessions, if he does not rush business as he has been in the habit of doing for the past ten years.

During these three years a steady change has been going on in the South. The cutting away of the timber immediately on the railroads, or within an ox-haul of them, has inevitably placed the business in stronger hands financially. A man with little money can buy and operate a portable, but when it comes to erecting a first-class mill, securing enough timber to last for years and building a logging road from three to twenty miles long, it takes money, and considerable of it. And when the amount of money necessary to the establishment of a first-class plant is invested, the man who makes the investment is liable to go about his business intelligently in order that the returns may make the right kind of showing. The little mills in the South run by irresponsible wood butchers have been constantly going,—sold by the sheriff to the highest bidder in many cases,—and better mills have been put in. The indications of to-day are that the mill facilities of the South will continue to improve. Many of the choicest tracts of timber lands have passed into the hands of northern capitalists, nearly all of whom are also lumbermen, and if these men, after their white pine timber is exhausted turn their attention to the manufacture of lumber in the South, it will be on the same grand and thorough scale that marks their operations now.

Most of the southern lumbermen have come to realize what they must do to be saved from disappointment. They have learned that the northern and eastern markets want well-manufactured lumber; they know that if yellow pine lumber gains headway outside of the South proper it must take the place of white pine; and they know that it will take business push to give it this headway. Looking to this end the manufacturers have formed organizations, so that the members may be of mutual benefit to one another. Thus by advising and discussing,—in short, by informing themselves, they will be able to conduct their business in a more satisfactory, and we trust profitable, manner.

We find, also, that there has been an improvement in the redwood business of the Pacific coast. It is not until a recent date that redwood could be laid down in the east at prices which would tempt the buyer. There was but a limited field for its use at home. A market was sought in England, but, we believe, with but little success. Sample cargoes were forwarded, a good price for the lumber was at first obtained, but it was not long before it began to depreciate in value, and we were lately informed by a gentleman who had visited the English markets that now it does not sell at a much higher price than poplar. The cost of manufacture has been considerably reduced of late, owing to improved machinery and facilities for logging, and the redwood lumber manufacturers may feel a hope that borders closely on assurance, that their stock will be wanted in the middle and eastern states if it can be laid down in those states at prices at which it has been sold during the past month, and from this on it probably will be at nearly such prices.—*Northwestern Lumberman.*

THE MAGNOLIA AS LUMBER TREE.

The magnolia is one of the most universally and deservedly admired trees in all the southern forests. There are seven distinct species of this tree but the name, magnolia, is rarely applied to any of them except the magnolia grandiflora though the other six as justly entitled to it. In some sections of the south it is called big laurel and big bay tree. Its fragrant white flowers, six to eight inches broad, contrasting strongly with the dark green of its thick, leathery evergreen leaves, six to ten inches long, make it a universal favorite as a yard of lawn ornament. In addition to its beauty and grace it possesses other qualities that make it valuable as a lumber tree. It grows to a good size, ofter attains a height of ninety feet, and exists in sufficient quantities to constitute an important factor in the lumber trade whenever the scarcity of other woods or the evolution in pulic taste creates a demand for it. The sample of this lumber in this office—a four inch strip dressed on both sides to $\frac{3}{4}$ inch in thickness—weighs 31 ounces to the square foot, and appears to be well adapted to almost any purpose for which poplar, basswood or any light, soft wood is used. It is of a light cream color, easily worked and not liable to split, though very straight grained.

Although the tree known as the magnolia proper is confined to a limited area along the southern coasts, the family of which it is the head is quite widely distributed. One of the largest species, the magnolia accuminata, is universally known throughout the south as the cucumber tree, from the resemblance of the green fruit to that vegetable in its green state, and is found from the northern lakes to central Georgia, but more plentifully in the fertile and moist coves and declivities of the Cumberland and Allegheny mountains. The lumber of this tree is considerably used in some localities and is especially suitable for wooden pump material.

The most widely diffused, and also the smallest of the magnolias in the M. Glanca, Lin., and is, we believe, most generally known as sweet bay tree. It is common along the coast from Louisiana to New Jersey, and is found in at least one locality north of Boston, Mass. It rarely exceeds thirty-five in height and as it blooms at a height of five of six feet, it is a favorite ornament. Its flowers are pure white two inches broad and of a powerful but grateful odor.

The other species of magnolia are variously known as cucumber tree, umbrella tree, and Indian physic. Only one of them, the Magnolia Cordata, of Micheaux, called heart leaved cucumber, attains a diameter exceeding fifteen inches, and none of them are found in sufficient quantity to make them of importance to the umberman, as yet.—*Southern Lumberman.*

WOOD PRODUCTS OF CHEMISTRY

I appears from the experiment of M. Senff, that the yield of crude pyroligneous acid, tar, charcoal, and gas is almost the same with the most different woods. But the richness of the acid waters in acetic acid, and consequently the yield of dehydrated acid, vary greatly. In this reepect the wood of coniferous trees is the least valuable. The wood of the trunk furnishes more acid than that of the branches. The wood yields more acid than the bark, and sound wood more than dead wood. Rapid calcination yields more gas at the expense of the condensed products and of the charcoal; it yields also the weakest acid waters, and the charcoal is more hygroscopic than that furnished by a gradual action.—*Timber.*

MR. JOHN KILBURN, with about 160 men, has been at work since September last cutting logs in the Province of Quebec for Mr. W. H. Murray. The cut this year is about eight million feet. Mr. Kilburn went north last night with about 30 men from Fredericton to commence stream driving, which operations will last until about the first of June. He will have about 100 men at work with him.—*St. John, N. B., Globe.*

THE new Chicago, St. Paul, Minneapolis & Omaha dock, now under contract, with Winston Brothers, at Duluth, will be 1,100 feet long, and will require 1,250,000 feet of lumber and timber and will cost $100,000.

Chips.

On Arbor Day 50,000 trees were planted in Berks County, Pa.

Calvin & Son's first square timber raft of the season has left Garden Island for Quebec.

Large shipments of dressed lumber are being made from Deseronto by the Rathburn Company to neighboring towns and cities.

J. R. Booth and G. W. Perley, well known lumbermen, have subscribed $1,000 each towards the relief of the sufferers by the fire at Hull.

The Canadian Pacific snow sheds, in the Selkirk Range and the Rockies, will be 12 miles in length and will contain 14,000,000 fee of timber.

Gow, Mayo & Co., of Muskegon, Mich., have sold their entire season's product of sawdust for shipment to the terra cotta works at Pullman, near Chicago.

Indications and actual figures point to the probability that $80,000,000 will be spent within two years in the constructions of new railroads in the United States.

The Emery Lumber Company last winter but 53,000 logs, scaling 12,500,000 feet, into Wahnapatie river, Canada, which will be driven o the mouth of French river, and thence shipped by lakes to Tawas and East Saginaw.

The following vessels are said to have been chartered by Messrs. Price Bros., Quebec, to carry lumber to St. John's, Newfoundland, at $4.50:—Schrs. J. Savard, Marie Erzelie, Ste. Anne, Marie Vigilante, C. Berner. and Marie Anne.

The Stroudsbury, Pa., *Jeffersonian* says that among the recent orders received at the Tanite Factory was one from Peru, South America. It calls for two dozen Tanite Emery Wheels to be used in smoothing the blanks from which silver dollars were to be coined.

The first ocean steamer came into Montreal harbor on April 30th. There have been several other arrivals from sea and the harbor is fast assuming its usual busy summer aspect. The Lachine Canal opened on May 3rd, and navigation on both the St. Lawrence and the Ottawa is now fully open..

The *Timber Trades Journal* of April 17th says:—Some vessels forming a portion of the Quebec fleet left the Tail-of-the-Bank for the outport this week. They carry coal at a freight it is stated of 2s. 9d. a ton which will just pay for the loading and discharging. The fleet is later this year in leaving the Clyde. Freights, Quebec to Clyde, about 18s. per load.

It is proposed to incorporate at Ottawa Messrs. E. B. Eddy, G. H. Millen and S. S. Cushman, of Hull; R. R. Dobell and Thomas Beckett, of Quebec, and others, as the E. B. Eddy Manfacturing Company, with power to do lumbering, make matches, sashes, doors and woodenware pulp, etc., as well as to own vessels and do forwarding thereby. The bill passed with amendments.

The American Paper Manufacturers' Association embraces all the factories in the country numbering probably 1,000 representing a capital of $75,000,000, employing between 40,000 and 50,000 hands at the cost of $12,000,000 annually. These factories pay $50,000,000 per annum for raw material alone. and they can turn out 1,200,000 tons of manufactured product.

An illustration of the advantage of trees to a country, says the Montreal *Star*, is to be found in Siberia. The Russian Government has been planting trees for half a century, and in one province has seventy plantations, ranging in size from eighteen thousand to to twenty-one thousand acres each. The result is that many sections, once to arid for agriculture, now have abundant rain falls. Why cannot Canada profit in this matter by the experience of other nations?

A discovery has been made at Brigg, Eng., which has arroused considirable interest among antiquarians. While engaged in excavating at the Brigg Gasworks some working men came upon a large boat bedded in the clay some three or four feet below the surface. On the boat being bared yesterday it was found to be 48ft. long, 4ft. 4in. wide and 2ft. 9in. deep. It is undoubtedly ot very ancient construction, being cut out of a solid piece of oak. Great care is being taken in order to get the boat out of its bed with as little damage as possible.

The warm weather of April, says the Belleville *Ontario* of May 8th, by suddenly melting the snow, is likely to interfere with the driving operations on the streams, great quantities of logs are said to be already hung up for want of water. Over 100,000 logs belonging to Gilmours are said to be stuck on the Moira river alone, and other operators will find themselves in the same case. On the Salmon river the drives are getting on very well. A large boom of logs was broken on Cross Lake. There is a great head of water on that inland sea, the water having risen at Newyton's dam two feet higher than during any former year.

THE WASTE OF FENCES.

In no branch of rural economy is there so much needless waste of forest products as in fencing. A great reform must needs be institut ed, as the expense of lumber grows greater year by year. A single square acre requires 50.6 rods of fencing to enclose. It has been stated that from one-quarter to one-eight of the present fence of the country would be amply sufficient to keep stock within proper limit. The amount thus saved in a year would aggregate million of dollars in some of the larger states. Estimates have been made showing the cost of fences in the United States to be $1,700,000,000, and the annual cost of maintenance at $168,900,000, including interest at six per cent, upon the original cost. The farm fences in the state of Maine are estimated at 41,052,000 rods, or 131,000 miles in length. The first cost cannot be reckoned at less than $42,000,000. Upwards of $8,000,000 are invested in farm fencing in the states of Connecticut. Total cost of fencing in New York State aggregates $228,844,611; Ohio, $155,580,693; Indiana, $100,750,415; Illinois. $128,856,513. These figures give some conceptions of the immence totals of lumber consumed for the single purpose of fencing.—*Ex.*

SETTLING DOWN IN CHICAGO.

Chicago, May 11.—No attempt has been made to resume operations in the Westside lumber districts this morning and eight to ten thousand men employed in the yards and planing mills are still idle. Lumbermen claim that the great majority of the men are overawed by the Bohemian Socialists who infest the region. In the north and south divisions and at South Chicago the yards and planing mills have all fully resumed on the old basis. The metal working establishments opened again this morning with larger working force than yesterday. The boot and shoe manufacturers who tried eight hours a day as an experiment, are considering the advisability of returning to 10 hours. Evidences of the presence of the great strikes are, therefore, rapidly disappearing in every portion of the city. The police are devotiug their energies to procuring evidence against the Anarchists, and it is claimed at the trial of the conspirators the evidence will be ample for the conviction of August Spies, Schwab, Parsons and Fischer.

Disastrous Fire at Hull.

Hull, Que., May 9.—A disastrous fire visited this place last night. All the buildings on the east side of Duke street and along one side of Philemon street are destroyed, as well as the handsome new post office on Main street. The real value of the buildings destroyed is estimated at about $125,000. There 110 buildings divided into 155 tenements, and in these probably 175 or 200 families resided. In the stores on Main street a lot of stock was detroyed. The total loss may safely be p laced at $175,000 or $200,000, on which there is very little insurance.

A battery of three boilers is being made by Thomas Bros., Eau Claire, Wis., for the Bow river, Alberta, Northwest Territories of Canada. The company expects to have its mill running this season. It will be the first large mill in that remote part of the Dominion.

One box will cure recent cases. Each box contains one month's treatment. One dollar a box, or six boxes for five dollars; sent by mail prepaid on receipt of price. We guarantee six boxes to cure any case. With each order received by us for six boxes, accompanied with five dollars, we will send the purchaser our written guarantee to refund the money if the treatment does not effect a cure. Guarantees issued only by J. D. TULLY Druggist, Sole Agent for Peterborough.

THE CANADIAN NORTHWEST.

A correspondent writes from Winnipeg, Man., to the *Northwestern Lumberman* as follows :—

Some attention has already been called in the *Lumberman* to the development of a new and distinctive lumber interest in the extreme northwest suggested by the building of mills at Crookston and Grand Forks by T. B. Walker. These enterprises of Mr. Walker are in fact, but a part of the transformation now going on in the lumber business of the Canadian Northwest, and which must have for all time their centre in this city. Prior to 1883 Mr. Walker and N. P. Clarke who were the owners of about all the stumpage in the Minnesota pine region on waters flowing north into the Red river of the north found a market for such quantity of timber as they saw fit to cut, at mills located in this city. There were five of these, and logs, during the years when the phenominal and disastrous boom was on, in 1882-83 sold in this market as high as $18 a thousand. This was not regarded as an exorbitant price, considering the fact that the logs had to be driven 1,500 miles, that it took three months to get them here and that the Red river offers no perfectly safe facilities for holding the logs once they are in the water.

Messrs. Clarke and Walker at that time virtually held a monoply of the lumber supply of this region, since they could bring into the Provinces logs free of duty while lumber was subjected to a duty of 20 per cent. At that time the Canadian Pacific had not penetrated to the east and had not made accessible the pine along and tributary to the Rainy Lake river, and Lake of the Woods. With the subsidence of the town came financial disaster, and almost without exception the manufacturers here found themselves practically bankrupt. The Winnipeg Lumber Company, which had been Mr. Walker's principal customer, had its affairs turned over to trustees, and Mr. Clarke, who had made arrangements to sell his logs to J. R. Sutherland, found it necessary to have them sawed on his own account, and is now of the firm of Sutherland & Clarke, engaged in disposing of the product of these logs. In the midst of the sawing, Mr. Sutherland's mill was burned. During last season the only mill operated was that owned by D. E. Sprague, who owns a small pine limit nearly exhausted on the Passeau river, a tributary to the Red river, entering the larger stream very near the boundary line. I am assured that the probabilities are that after this season, when the last of Mr. Sprague's stumpage will be cut off, that no more lumber will be cut in Winnipeg. There will remain to be supplied, however, this growing city of 25,000 population and a country rich in possibilities, stretching clear to the Rocky Mountains. The demand of this vast territory is being anticipated, and while Mr. Walker undoubtedly expects to find a market for a part of the annual cut of 40,000,000, he expects to make at his Minnesota mills, the greater portion of the supply is destined to be drawn from mills located on this side of the line.

The centre of operations is already, and promises to be for years to come, at Rat Portage, about 180 miles east of here, at the point where the Canadian Pacific strikes Lake of the Woods. There has been built at, or near this point, the past season, two new saw mills, equal to the best modern American mills, with a capecity of 100,000 feet in ten hours. One of these was put up by the Rainy Lake Lumber Company to take the place of a mill destroyed by fire, and the other by the Minnesota & Ontario Lumber Company, the heaviest stockholders in which are Dennis Ryan, the St. Paul capitalists, and W. J. Macauley, who has had exceptional opportunity to study the pine region on the northern waters in Minnesota, who has secured contract of a large part of it, and who is thoroughly posted. I met Messrs. Ryan and Macauley here recently, just returning from Rat Portage. Their mill was not completed until September, and after that date sawed 4,500,000 feet of lumber, 2,000 000 shingles and 1,000,000 lath. They had a stock of 15,000,000 feet of logs on hand, and they put in, during the winter, 3,000,000 n addition. Mr. Macauley estimates that there is on the Minnesota side, tributary to waters flowing north, about 1,000,000,000 feet of pine, principally white pine, of better quality, he says, than that further south. This lies on streams which are easily driven. At present his company is cutting on the Big fork of the Rainy river, floating their logs about 180 miles to the Lake of the Woods and then tow them to Rat Portage. Lake of the Woods is a beautiful body of water, dotted with thousands of islands, and the rafts are easily and safely taken across the lake.

The Rainy Lake Lumber Company's mill was not operated last season, and its future is dependent upon negotiations which are now pending looking to the accession of more capital. Hugh Sutherland, who is the principal stockholders in the company, and who is thoroughly conversant with the subject, tells me that the pine region on the Canadian side extends from Rat Portage on Lake of the Woods as far east as Lake Superior, and the northern line is pretty clearly marked by the line of the Canadian Pacific. In this area there is between 800,000,000 and 1,000,000,000 feet of pine, white and Norway, of which amount his company controls 350,000,000 feet, selected before the present Government requirement was imposed that the selection should be made in 50 mile limits.

In addition to the mills already mentioned, there is at Rat Portage the Bullmer mill with a daily capacity of 35,000 feet; a mill owned by Cameron & Co., with a capacity of 25,000 feet; a water mill owned by Dick Bonning & Co., capable of cutting 40,000 feet daily; and at Keewatin, three miles east, the plant of the Keewatin Lumber Company, which consists of a water mill of 75,000 feet capacity, a complete planing mill, etc. This latter company cut nearly 15,000,000 feet of lumber last season, and with ample capital has been up to this time the leading lumber concern of this section. Throughout this region there remains in addition to these mills a few small concerns cutting spruce, and it is estimated that of a total stock of 70,000,000 feet of sawed lumber on hand December 14th that fully 20 per cent. was spruce, the use of which the people have learned.

First common white pine in this market commands about $18 a thousand; red pine, which comprises a large part of the whole stock, is worth $16, while spruce can be bought for $12. It is largely used for dimension, siding, etc. Fully one-half of all the pine on the Canadian side is Norway or red pine, the abundance of the supply resulting in its very general use. I find in all the buildings here that it is freely used for flooring, wainscoting, ceiling and inside finish generally. None of the timber produces a larger proportion of clear lumber, but it is usually sound and the knots small and firm.

At Fort William and Port Artbur, 250 miles east of Rat Portage, there is springing up another lumber centre. At Fort William there are mills owned by W. H. Carpenter, Graham, Horne & Co., and the Neebing Lumber Limit Co, the latter recently established; and at Port Arthur the Port Arthur Lumber Company. The combined capacity of these mills is about 30,000,000 feet yearly. The Rat Portage manufacturers and the Winnipeg dealers do not anticipate that lumber manufactured at Port Arthur will ever enter into competition with their product, but the Canadian Pacific during all the past season has found it possible to bring lumber from Ashland across the lake to Port Arthur and ship it west. I think that time will develop that such lumber as may seek a market from the mills at Port Arthur and Fort Williams will ever figure in competition with that produced further west. Railroads are likely to still further develop the industry and afford another outlet.

Manitoba and the Northwest territories are rich in agricultural lands and it has been proven that more and better wheat can be raised than in Minnesota and Dakota. The development of the country is going on slowly, but it is going on all the same, and when it is considered that there is tributary to this city a territory as large and as fruitful as that tributary to St. Paul and Minneapolis, it can readily be expected that the future will witness a large development of this lumber interest, located on the northern waters and centered about Red Lake, Lake of the Woods and Rainy Lake. For the past two years all this country has suffered from the result of the collapse of the boom contest in Winnipeg, during which values for business property were run up beyond prices paid in Chicago. The upward turn has come, confidence is restored and prosperity is in sight.

I find no confidence that a great deal of money is to be made in the lumber business this season, but a healthy demand and fair profits are believed to be not far away by the men who have recently made investments. All the region west of Winnipeg must be supplied from the sources indicated, except so far as spruce in limited quantities, jack pine and hardwoods can afford a supply. No timber supply of any importance is encountered until the western slope of the mountains is reached, where there is an abundance of what is known as the Roberts pine, a coarse-grained white pine, growing in great plenty in very large trees.

FORESTRY.

Prof. William Saunders, in his report to the Canadian Department of Agriculture on Agricultural colleges and experimental farm stations, with suggestions relating to experimental agriculture in Canada, gives much information on forestry, including the following :—

There should be a competent forester in charge of this department, one who thoroughly understands what is needed and under whose direction all work connected with the forest industries of the Dominion should be carried on. Such would include experiments in reclothing denuded land, testing the comparative value of our native trees, also of those from all other parts of the world where similarity of climate or other circumstances render it probable that they will prove useful. It would also include the propagation of trees of economic value for general distribution.

On this important subject I have been favored with a communication from Mr. Bernhard E. Fernow, of New York, Secretary of the American Forestry Congress, one of the best authorities on this continent, a graduate of the Prussian Forest Acadamy at Munden, who served as chief forester under the Prussian Government for several years before removing to this country. His letter which was kindly written at my request contains so many valuable suggestions that I append it in full :—

"AMERICAN FORESTRY CONGRESS,
"OFFICE OF THE CORRESPONDING SECRETARY,
"12TH JANUARY, 1886.

"*Wm. Saunders, Esq.* :

"MY DEAR SIR,—In reply to your request for my opinion in regard to the needs of forestry in the Northwest Provinces of Canada, and to a plan for its introduction, allow me to say that a subject so important and complicated can hardly receive adequate treatment within the limits of a letter. Space, and my time for using it, being limited, my knowledge of the specific conditions of the region in question being only imperfect, and not derived from personal inspection, I shall content myself with giving you simply such general hints from the standpoint of a forester as may be useful in forming your own answer to the questions you ask.

"The subject of forestry in your country seems to me to have two distinct aspects. Forest conservation and the restoration of natural forests are required on the larger area, and mainly for economic purposes, while agricultural needs call for the creation of new forests in a more limited part of the Dominion, mainly, I believe, in the Provinces of which you speak.

"I assume that the climatic and hydrologic influences of forests in general are too well known to need discussion. That a permanently successful agriculture depends on a judicious distribution of forests is the natural consequence of those influences. As the improvident denudation of large forest areas in the old world and on this continent has rendered those districts barren and unproductive and of no value for agricultural purposes, there can be little doubt that reforestation will be the best aid for restoring favorable agricultural conditions.

"Aside from the economic value of the wood lot and the mechanical influence of the windbreak, retarding the velocity of surface winds, and lessening the severity of blizzards, the most important effect of forest areas properly distributed lies in their hydrologic significance.

"They are the cheapest, the most reliable, the best irrigators. This office is due rather to a negative influence upon passing rain clouds. The forest does not prevent rainfall, as does the open plain; for while the extensive, treeless plains present an air column, which, being dry and of high temperature, raises the point of saturation of a passing rain cloud, and allows it to pass without deriving the benefit of its moisture, the cooler air hovering over the forest tends rather to lower the point of saturation, induces rainfall on the neighboring territory, so that the most helpful agency of the forests on agriculture is attained by their distribution, in belts or clumps, over the agricultural lands.

"The co-relation of forests and atmospheric moisture is such, that while the latter, to a certain degree, is a *conditio sine qua non* for forest growth, at the same time the growing forest tends to increase the atmospheric moisture of its surroundings, creating the very condition which it requires for its development.

"I consider, therefore, that the reforestation of the treeless and arid plains, and thereby their recuperation for agricultural uses, is, beyond doubt, not a difficult task, if begun judiciously, starting from the outskirts of the present forest area and reaching forward gradually with those species, which, like the cottonwood, soft maples, birches and others, will vegetate in the arid soil and dry atmosphere of those plains. These species may not be the most desirable for timber growth, and should therefore be replaced as soon as sufficient increase of favorable conditions is attained, by undergrowing them with more valuable species, gradually removing the first crop, which had fulfilled its office by preparing the way for its betters.

"To accomplish the result—modification of climatic conditions—the extent of such forests must be commensurate with the vast area needing the change, and it is questionable whether the individual efforts of small settlers will not be too isolated, and the results too limited and too remote, to be appreciably beneficial.

"But if the Government does not undertake such forest planting on a large scale, as has been done in European countries, and is now practised in India and Australia, it would certainly be a wise policy to inaugurate and supervise systematic planting of forest belts or clumps as a condition of land grants from the public domain. But this would place the moral obligation upon the Government of providing at least all possible protection against failure, by gathering and disseminating the necessary information on forest growing. Cautious and judicious proceedings are in no enteprise more necessary than in forestry, if financial results are of account. While agricultural experiments are answered in a year's time, or at least in a few year, the results of forestal operations cannot be ascertained until many years are elapsed. Mistakes are apparent only after generations have passed, especially when timber value or financial results form the main object.

"A few examples may illustrate my meaning. Some eighty or ninety years ago the American white pine was highly extolled in Germany as a desirable immigrant and largely planted. To-day it is found that to attain the quality which we demand for building timber the white pine requires more than one-third longer time than the native Scotch pine. Whether the larger yield per acre will offset the amount of interest on the original outlay thus lost, is extremely questionable.

"Another mistake was the cultivation of birch in pure (unmixed) growth, which found its advocates some years ago. The results of this birch mania have been large areas impoverished under the thin foliage of the birch, which neither shades the ground nor enriches it with suitable humus, taxing the ingenuity of the forester to restore the soil to proper condition.

"The mistakes made in European forestry are frequent enough to serve as a warning to others to proceed more judiciously.

"I would not discourage the planters of walnut in our northern climes, who, from the rapid growth whibh the tree makes in the first

ten or twenty years, calculate the prospective of the work to which I was called for some time, namely, to ascertain the rate of growth of different species at different periods of their life, and the bearing of this upon the financial result of their cultivation.

"To show you what such a small item as the distance of planting may have upon the ultimate results, I copy from my note book the following figures of an experiment. Thirty acres planted with Scotch pine in different widths, actual measurement, after twenty-five years' growth revealed these results :—

Interval, between plants.	*Proportion of yield.*
3 feet	1.60
4.5 "	1.50
6 "	1.22
7.5 "	1.20
9 "	1.00

"Such examples may be used to show that forest experimentation cannot be expected to be undertaken by private individuals—at least, that systematic Government aid is necessary, if it is the interest of the Government to achieve results for the benefit of its constituents.

"No where, it seems to me, are measures of encouragement by Government called for more urgently than in establishing systematic forestry in your country. Part of Canada's wealth lies in Canada's forests; the nature of the soil and climate in the northern districts of the eastern and central provinces is, to a large extent, not fit for anything but forest growth. Yet Canada is utilizing the natural growth in such a manner as to deteriorate her forest capacity, and often even her agricultural possibilities. Timber growing will eventually become an economic necessity for Canada; few lumbermen under existing conditions can see any advantage in utilizing supplies with other views than those of immediate gain—a man's life seems too short to enter upon such extended enterprise as forestry—interest in future supplies can concern the State alone; at least, so it seems at present.

"The time for a wiser forest policy has come and the Government should lay now, while it still retains land and forest, the foundation of systematic forest management—at least, to set, as in Germany, the example after which private owners may form their forestry."

"There seems to be a misunderstanding as to the position which the different Governments of Germany hold in respect to their forests. Only one-third of the entire forest area is State forest, not quite one-fifth belonging to communities is under restrictive State supervision, and balance, very nearly one half (in Prussia 53 per cent.) is in private hands, to the unrestricted use of their owners, excepting a few cases, where the danger to neighboring agricultural lands from the indiscriminate removal of the forest makes its management under restrictive rules necessary. Yet the good example set by the management of the Government forests has largely induced a similar management of private forests by their owners, who frequently employ the neighboring Government officer at a small remuneration to make their working plans.

"In Germany, where empiric forestry has been practised for more than two centuries, the necessity of experimentation upon a scientific basis, though recognized long ago, has found practical expression only recently. France has followed, and we may say that with the year 1870, when the first experimental stations were established, one in Baden and another in connection with the forest school at Tharana, in Saxony, a new epoch in the art of forestry has been inaugurated.

"The other Governments soon followed, so that there are now eight central forest experiment stations, with a large number of secondary stations. All these, except the Austrain, have formed a union, called the Association of the German Forestal Experimental Stations, and work under a common plan harmoniously together, to furnish a scientific foundation for a rational management of forests, based upon exact experiments and careful investigation.

"Your Governmen may congratulate itself that it can build upon the expe ience of older nations. For although European administrative methods and local management may not be translated into Canadian practice, their study will be no small aid in divising a system for your own use. As for their methods of scientific research, and for the establishment of the general natural laws governing forest growth, we may not hesitate to adopt the former and apply the latter as well in forestry as we do in Agricultural.

"The natural laws being uniform all over the world, their practical application will depend only on sound judgement of local conditions. These we have to study here. What we no not know and cannot learn from the extensive European libraries of forestal literature is the capacity of our native species—not less than 95 in Canada (some 20 only in Germany); their rate of growth in different periods of life; their adaptability to conditions of soil and climate; the best mode of propagation and treatment in in the forest generally; the time of their maturity; their value as timber; their valve as conservers of forest capacity; their yielding capacities; their behaviour towards each other (a most important and, in this country, almost disregarded consideration for the forest grower), and many other points essential to a successful forestry. In the face of the utter ignorance on the forestry of our native species, I will not mention the subject of acclimatization of desirable foreigners.

"Close observations and scientific experi ment are needed to arrive at this faundamental knowledge.

"In this work one thing particularly should not be overlooked, namely, that observations on tree growth for use in forestry must be made under forest conditions. The nurseryman and gardner have very different objects in view. They work under different conditions; their experiences may often mislead the forester, and their methods, in most cases, he cannot adopt. If anything, therefore, is to be accomplished in forest experimentation, the experimenter must study forest conditions and employ them in his experiments.

"I see that the Dominion Lands Act, as amended, provides for reservations on the slopes and crests of the Rocky Mountains for the purpose of preserving an even water supply. Such reserves should be placed under the same direction as the eventual forest expertmental stations. Other reserves in the plain, giving the opportunity of studying different forest condition of applying conclusions for practical results, are not only an essential adjunct to forest experimentation, but may eventually form the nucleus for for systematic forest economy.

"Such reserves, while in the first designed to serve an experimental grounds, should be made large enough to establish and support a regular forest department, and, with a conservative policy, may be so managed as to demonstrate financial possibilities, and could in time be made to pay for the expenses of all forest experimental stations. Germany, with a forest area of 35,000,000 acres, of which only 23 per cent. are state forest, expends on experimental stations alone in the aggregate over $30-000, out of which only few salaries are paid, the experimenters being otherwise paid owners. Experimentation in forestry then, as in agriculture is of a double character, the nursury and forest garden in connection with the botanical laboratory corresponding to the laboratory of the agricultural chemist, while the model farm finds its counterpart in the natural forest and the plantation.

"It would take me too far to enter into the details of organization except to say that centralization is of the greatest necessity, and that the central station should be connected with agricultural colleges or experimental stations, where the aid of scientific apparatus can be most readily and cheaply secured. Forestry being based somewhat similarly to agriculture, upon a knowledge of natural sciences, the aid of the scientific staff of such institutions would be an advantage; specialists in botany, chemistry and technology, geology, &c., can be directed to give attention to their subjects as related to forestry, and occasional or regular lectures on forestry matters, by the forest director and his staff, will soon engage close attention from the students of agriculture and practical application in the management of their wood lots at home.

"I hope you will find, in the foregoing suggestions, something to aid you in deciding whether and how your Government should take steps to provide for the future, not only of Canadian forests, but also of successful agricultural settlements on the treeless plains.

"If I can aid you further, please indicate in what manner, and I will cheerfully do so.

"Yours very truly,

"BERNHARD E. FERNOW."

FLOODS AND FORESTS.

Attention has been drawn lately to the matter of floods, from a great calamiity which has overtaken Montreal. But it may be valuably pointed out that every spring floods more or less disastrous occur throughout Canada, and that the cause of this, to a very great extent, is the destruction and deterioration of such large portions of our original forest as are continually falling before the axe, or swept away by the devastation of accidental fires. On many of our higher lands, where formerly stood dense masses of woods which retained the spring rains and the waters of the melting snows, letting them gradually flow into the creeks and rivers, pursuing thence a calm and steady course towards the ocean, there are but vast stretches of bare and rocky soil, from which pour the descending waters of the spring in sudden floods towards our lakes, and occasion the evils we have alluded to. Then in summer, when these waters are needed for the refreshment of the thirsty lands, there exists no reservoirs to supply them—and the scarcity of moisture increases the injury which its superfluity commenced.

It is time that farmers and land-owners took thought in that direction—nor contenting themselves with taking thought, but take action likewise. The Ontario Government has lately very wisely applied itself to diffusing information on this important matter. But to act on this information in a free country like Ontario, where the land is very largely in the hands of private owners, must be the business of those owners themselves. If every farmer in Canada could give, for a few years, but one week in the year to planting and caring for trees, the country would soon have fewer floods, a far better climate, and every agriculturist (at least so the ablest scientists on the subject assure us) would obtain in crop, cattle and every article of produce a far better return for the outlay of labor he now yearly invests.—*Woodstock Standard.*

McGregor & Parke's Carbolic Cerate is invaluable for Wounds, Sores, Salt Rheum, Cuts Burns, Scalds and festers, as a healing and purifying dressing. Do not be imposed on with other useless preparations, recommended to be as good. Use only McGregor & Parke's Carbolic Cerate Sold by John McKee.

If you are afflicted with rheumatism call on J. D. Tully, druggist, immediately and procure a bottle of West's World's Wonder or Family Liniment, it is a certain and positive cure. It is infallible for sprains, cuts, bruises, burns, scalds and all diseases requiring external application. Price, 25 and 50 cents per bottle. Sold by J. D. Tully, druggist.

Perhaps the most extraordinary that success has been achieved in modern science has been attained by the Dixon treatment for Catarrh Out of 2,000 patients treated during the past six months, fully ninety per cent. have been cured of this stubborn malady. This is none the less startling when it is remembered that not five per cent. of the patients presenting themselves to the regular practitioner are benefitted, while the patent medicines and other advertised cures never record a cure at all. Starting with the claim now generally believed by the most scientific men that the disease is due to the presence of living parasites in the tissues, Mr. Dixon at once adapted his cure to their extermination; this accomplished the Catarrh is practically cured, and the permanency is unquestioned, as cures effected by him four years ago are cures still. No one else has ever attempted to cure Catarrh in this manner, and no other treatment has ever cured Catarrh. The application of the remedy is simple and can be done at home, and the present season of the year is the most favorable for a speedy and permanent cure. the majority of cases being cured at one treatment. Sufferers should correspond with Messrs. A. H. DIXON & SON, 305 King street west, Toronto, Canada, and enclose a stamp for their treatise on Catarrh.—*Montreal Star* 1y|22.

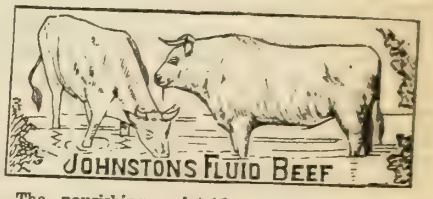
Johnston's Fluid Beef



The nourishing, palatable and warmth giving qualities of Johnston's Fluid Beef has caused this invaluable preparation to before a favorite and fashionable beverage for the winter season. It is now obtainable on draught at the leading hotels and restaurants throughout the Dominion 18t7

MAIL CONTRACT.

SEALED TENDERS, addressed to the Postmaster General, will be received at Ottawa until noon, on FRIDAY, 14th MAY, for the conveyance of Her Majesty's Mails, on a proposed contract for four years, six times per week each way, between

BOBCAYGEON & PETERBORO'

from the 1st JULY next.

The conveyance to be made in a Waggon or Steamboat, via Bridgenorth and Ennismore.

The Mails to leave Boycaygeon daily, Sundays excepted, at such an hour as will ensure arrival at Peterborough in time for the despatch of the mails by the afternoon train to Port Hope.

Leave Peterborough as soon as possible after the arrival of the morning train from Port Hope and to arrive at Bobcaygeon in four and a half hours afterwards.

Printed notices containing further information as to conditions of proposed contract may be seen, and blank forms of tender may be obtained, at the Post Offices of Boccaygeon, Bridgenorth, Ennismore and Peterborough, and at this office.

DAVID SPRY,
Post Office Inspector.
Post Office Inspector's Office, Barrie, 8th April, 1886.

Communications intended for insertion in the CANADA LUMBERMAN, must be accompanied by the name of the writer, not necessarily for publication, but as a guarantee of good faith. Communications to insure insertion (if accepted) in the following number, should be in the hands of the publishers a week before the date of the next issue.

The CANADA LUMBERMAN is filed at the Offices of MESSRS SAMUEL DEACON & Co., 154 Leadenhall Street, London, England, who also receive advertisements and subscriptions for this paper.

PETERBOROUGH, Ont, MAY 15, 1886.

NEW BRUNSWICK FORESTS.

The New Brunswick Government has published an interesting work, written by Mr. Charles H. Lugrin, A. B., Secretary of the New Brunswick Board of Agriculture, on the resources, progress and advantages of that Province. The following is the chapter on the forest:—

Next to agricultuture the chief industry of New Brunswick is the manufacture and export of lumber. No country in the world is probably more densely wooded than New Brunswick, the area of land in a wilderness state not covered with forests being so small as to be merely nominal. Every acre of improved land in the Province, except the dyked lands, was at one time covered with a dense growth of trees, and there are yet millions of acres upon which the forest is unbroken. According to the census of 1881 the following amount of lumber was produced in New Brunswick in that year:

White pine	130,762	cub. ft.
Red pine	31,954	"
Oak	3,316	"
Tamarac	256,389	"
Birch and maple	348,441	"
Elm	2,400	"
Other timber	2,371,061	"
Pine logs	657,400	num.
Other logs	5,001,069	"
Masts and spars	54,406	"
Staves	955	m.
Lathwood	3,434	cords.
Tanbark	55,335	"
Firewood	781,729	"

The following statistics are from the same census and show the extent of the manufacture of lumber for home consumption and export:—

Number of Saw Mills	478
" of employes	7,175
Wages paid	$1,243,628
Value of raw materials	4,355,735
" of articles produced	6,532,826

The total cut of lumber, not including timber, in New Brunswick in 1883 was 225,000,000 superficial feet.

The most valuable of the New Brunswick forest tree is,

THE WHITE PINE,

so-called, from the whiteness of its wood when freshly cut. It is soft, light, free from knots and easily wrought. Its principal use is for the interior finish of houses, but it is adapted for many purposes.

RED PINE

is also found in the Province, and is almost as much esteemed as the white pine.

There is an extensive young growth of pine, and under a judicious system of forestry, the consumption would probably be exceeded by the annual growth.

BLACK SPRUCE

furnishes most of the deals for export. Thirty years ago it was estimated to constitute one-third of the forest, but this would not be considered an over-estimate. The annual cut has been very great; but the supply is yet large and will probably never be exhausted, or so reduced as to render the manufacture and export of spruce anything other than an important industry. The black spruce attains a height of from sixty to eighty feet and a diameter from eighteen to thirty inches. Its chief properties are strength, lightness and elasticity. It is largely used for building purposes. For export it is sawn into deals, which are 3 inches thick, 7, 9 and 11 inches wide and of various lengths. Other dimensions are also exported. Black spruce makes valuable "piles."

"Spruce logging," as it is called is a great industry in New Brunswick. It is prosecuted chiefly in the winter season when the snow affords loads by which the logs can be hauled to the banks of the streams. When the spring freshets come the logs are floated or "driven," as the expression is, to the booms when they are put together into rafts and are taken thence to the mills to be sawed. This industry gives employment to a great many men and horses, and furnishes a market for large quantities of farm produce.

WHITE PINE

is a smaller tree than the black spruce and its wood is not so highly esteemed. The supply is large, and it is cut and used indiscriminately with black spruce.

BALSAM FIR.

This is a common tree. It is quite resinous, producing what is known in the arts as "Canada balsam," which exudes through the bark. It is lighter in weight than either of the spruces and is used to some extent in building.

HEMLOCK SPRUCE

is larger in size than the black spruce. It is a firm, course-grained wood, lasting remarkably well under water or when kept thoroughly dry. Being very tenacious of nails it is much used for boarding in buildings. In the shape of logs it is much esteemed in wharf building and in mining. The hemlock is a widely diffused wood and is found in great quantities in several counties of the Province. Its bark is valuable for tanning purposes. In addition to the bark exported and that used in the country, there is annual export of extract of the bark to the value of about $200,000. The natural grain of hemlock, when varnished, is very pretty, and the wood is becoming fashionable for the interior finish of dwellings. Hemlock makes excellent packing boxes.

TAMARAC.

Hackmatac or larch is one of the commonest trees. It grows tall and straight to a height of eighty feet or more. The butts of the tree and one of the principal roots form a "knee," and are in great request in shipbuilding, forming an important article of export. Tamarac timber was much used in shipbuilding, but what is known as bay spruce has now largely taken its place, most of the large tamarac having been cut. There is yet much of smaller growth in the country, and, as it is a rapidly growing wood, it might be planted with advantage.

CEDAR.

Cedar is one of the most widely distributed and valuable of New Brunswick woods. It grows in wet ground and river valleys; sometimes a swamp of 50 to 100 acres in extent will consist of cedar trees standing so close together that their foliage is scarcely penetrable by the sunlight. It grows to a height of 40 feet and large specimens are two feet or more in diameter, but the majority of trees do not exceed a diameter of twenty inches, if measured a few feet from the ground. The wood of the cedar is light, soft, fine-grained and easily wrought. It has a pleasing, aromatic ordor, which it does not lose if kept dry, and hence is much esteemed as a material for closets. It is practically indestructible by the weather, and will stand a succession of moisture and dryness for many years. Made into shingles it will last upon the roof of buildings for upwards of thirty years, and its durability, when used as fencing, is even greater. Its lightness causes it to be esteemed by boat-builders. It is well adapted for household utensils as it becomes whiter and smoother by use. On nearly every farm sufficient cedar will be found to provide all requisite fencing, and this is a very important consideration to the settler. The principal use to which cedar is put, except for fencing, is for railway ties or sleepers, bridge piers, telegraph poles and shingles. The export of this wood is large and is chiefly to the United States. Shingles are of two kinds, shaved and sawed, the former are made by hand the latter by machinery.

Cedar makes a handsome hedge and is of rapid growth. This is not the true cedar; it is the Thuja Occidentalis of Linneus, and is also called the arbor vitæ.

BIRCH.

Black and yellow birch may be considered together as they are exported indiscriminately under the name of birch. The grain of black birch is very fine, close and pretty; it takes a bright polish, and is used to some extent in furniture and interior finish of houses. It is practically indestructible under water, and therefore is admirably adapted for piles and wharves. These birches grow upon the best of soils and the supply in the province is yet very great, although, in many districts, the larger trees, suitable for heavy timber, have been cut. The birch makes excellent fuel.

White birch and paper or canoe birch, though sometimes confounded are really different varieties. Owing to the vast supply of superior wood these birches are not much used except for the manufacture of show cases, spools, bobbins, brush backs, etc. It is from the bark of the paper birch that Indians make their canoes.

BEECH.

Two varieties of beech grow in New Brunswick, the red and the white. The red beech is a valuable wood. It is imperishable when kept perfectly dry or constantly wet. Being a hard wood and susceptible of a high polish it makes excellent tool handles, shoe lasts, mallets and the like. For agricultural implements or any purpose where strength and durability are required red beech is admirably adapted. It makes excellent flooring and is annually becoming more popular for this purpose. Red beech forms a considerable part of large forests and is becoming an important article of export. This tree produces very palatable nuts every second year.

MAPLE.

One of the most useful, beautiful and common trees in New Brunswick is the maple. There are several varieties of maple, but in general they may be described as lofty, well-shaped trees, with beautiful foliage; they are of quick growth and as they bear transplanting very well are greatly esteemed as shade trees, especially as they do not injure the grass growing beneath them. Their presence in the forest indicates the best quality of soil.

Rock maple is the king of the deciduous trees of North American forests; sometimes it grows nearly one hundred feet in height with corresponding proportions. In summer when clothed in green it is beautiful to look upon, and in autumn when its leaves change to blood-red, golden-yellow, brown and many other colours its appearance is magnificent. The wood of the rock elm is white when freshly cut, but becomes slightly reddish with exposure. The grain is fine, close, silky and very pretty, especially in the accidental, though common varieties, known as curled maple or bird's eye maple. Maple is adapted to all the purposes that beech is, but the more beautifully grained wood is much sought after by cabinet makers and others desiring a light wood of attractive appearance for finishing purposes. The bird's eye maple makes excellent violin backs. The ordinary maple is now sawn in various dimensions for builders' uses, and its popularity is on the increase. As a fuel rock maple is superior to all other woods; it makes the best charcoal and its ashes are rich in alkali.

The rock maple is also known as the sugar maple, because of the richness of its sap in the saccharine principle. Maple sugar is a regular article of commerce, the quantity produced in New Brunswick annually being about half a million pounds. It is made from the sap of the maple which begins to flow in the month of March. Syrup made from the sap is preferred to the finest grade of West India molasses.

(*To be continued in our next issue.*)

A MICHIGAN MAN'S VIEW.

Congressman Fisher, of the Tenth Michigan district, who is a lumberman, gives his views on the Morrison bill in the *Lumberman's Gazette* as follows:—

"I am not a protectionist," said Mr. Fisher recently in an interview, "nor am I a free trader; I am in favor of levying just enough import tax to meet the wants of the Government economically administered, and of making every article of luxury pay its fair share of that tax. I am willing to see the duty on wool, lumber and salt reduced if the rates of duty on sugar and iron and the rest of the necessaries of life are brought down in the same proportion, since nothing but the necessaries of life enter into the manufacture of lumber and salt. But it is rank injustice to put lumber and salt on the free list and leave the duty on articles of daily use the same."

"Why just look at it!" continued Mr. Fisher, "There can be no such thing as free lumber. For 1,000 feet of lumber, worth $12 at the wharf, consists of only $3 to $4 worth of timber on the stump, and $8 or 9 worth of labor, sugar, iron, horses, and working tools, and machinery of all sorts. And the wages of labor must be high, because the laborer has to pay a heavy duty on his sugar, woollen clothing, and a hundred other things that make up the necessaries of life. So when you put lumber on the free list, you should put everything else on the free list that goes into the manufacture of lumber, or that the laborer requires. The Democratic party is pledged to reform the tariff laws and to reduce duties, and I believe in doing it. But the proposed free list strikes at every important industry of the state of Michigan and would ruin their most valuable interests."

"However, I do not believe that free listing lumber and salt," continued Mr. Fisher, "would result as many think in making them cheaper and in allowing us to cut down the forests of Canada and bring the logs over to Michigan to manufacture. As soon as we attempt anything of that sort up will go the Canadian export duty on logs to $3 or $4 a thousand. They will not let us rob them any more than we would let them rob us."

Mr. Fisher thinks there is no need of letting in foreign lumber in order to save the Michigan forests. He says that the day when the cutting away of the trees in that state will cause a dearth of timber and the resulting evils of floods and change of climate is "away in the future" so far that it need not yet be considered. "The climate is good enough for me yet in Michigan," said Mr. Fisher. "Sufficient unto the day is the evil thereof. I believe in this generation taking care of itself and letting future generations do the same. There is no need of worrying ourselves over this matter. And besides," said Mr. Fisher, "when you once begin cutting timber as we are doing in Michigan, you can't stop. It would be ruinous to the owners of the timber tracts to hold the land without receiving enough from the products of the forest to pay taxes and interest. And it would be no less ruinous to the forests to stop cutting now, for it is a fact well known among Michigan lumbermen that, owing to some peculiarity of the soil or the climate of that state, when you cut over into a corner of a tract of woodland it seems to cause to death of all the neighboring trees, and this destruction extends farther and farther into the forest. Then there is the risk of fire. If one man cuts into his timber, leaving the dry limbs on the ground, it causes forest fires."

Subscribe for the CANADA LUMBERMAN.

LUMBERMEN GOING SOUTH.

Chicago and Michigan capitalists have created quite an excitement by purchasing all the best pine lands in Lousiana and Mississippi. Reports came from New Orleans that the Northern lumber kings have recently purchased 1,446,300 acres of Government lands at $1.25 per acre, making a total of about $1,800,000. Three years ago surveying parties and experts began to explore both States, locating carefully all of the longleaved pine lands in proximity to water and other transportation. When the information was all secured the desirable lands were taken up quickly. A list of the purchasers embraces many of the largest Michigan and Northwestern lumberman. The gradual disappearance of pine in Michigan has led the lumber barons to turn their attention to the Southern and Pacific coast pineries. The South had the advantage, because it could supply the same markets that have drawn on Michigan at about the same price. The leading question at the outset was: Could the white pine have a successor in the market? This has been answered in the affirmative, using yellow pine for framing and building purposes, and cypress in connection with finishing. Thus it is calculated that yellow pine and cypress may supersede the white pine, and that the South hereafter is to be the region to which the country, especially the West and Southwest, must look for its supply. Taking Louisville as the central market, both pines are found to be equidistant. The Michigan pine lands are new selling at from $25 to $75 per acre, while the Southern pine sells at from $1.25 to $2 50 per acre, In regard to economy of handling, the Southern pine is known to have a great advautage. The ground were it grows is level and open. The forests are like a grove with no underbrush, so that one can drive through them anywhere. There is little expense for road building, except through swampy districts. The Southern steamers are favorable for running logs at times and are deep and sluggish, more favorable for rafting than running logs. One disadvantage of logging in the South is in regard to supplies for log men. There is no adjacent farming region as in the North. The Southern pineries are little troubled with fires, as they contain no underbush. Herds of cattle and sheep feed in them. Every spring the grass and sprouts are burned off with little danger to the trees. The pineries are generally intersected with bayous, but logging railways can be laid at moderate cost. The cypress is soft, more closely resembling the better qualities of the white pine. It is easily worked and commands a high price in the market, merely because of its value and superiority. It grows in clusters on low, swampy grounds subject to overflowe:s. On account of its aquatic life it seems to endure exposier to the weather. Cypress roofs and sidewalks in New Orleans are a centry old. Cypress is usually cut in low water and floated out in high water. The Northern lumber companies are rapidly erecting mills and putting them in order in certain sections of Louisiana and Mississippi. From present appearances the lumber in these States will soon exceed the cotton interest. Suffice it to say there is an enormous supply of these varieties of lumber, and their manufacture and marketin6 will have some effect on the price of Western lumber.—*Manufacturers Gazette.*

A North Wisconsin paper states that "among the logs brought down this spring to be sawed by the La Crosse mills are thousands that have been lying in Rocky Run creek for the past 20 years. Logs may be found bearing the stamp owner dated in 1867. One log is supposed to be the largest ever taken out of the Black river country. When measured it scaled 2,200 feet. It was cut 19 years ago this spring."

The Mexican Government lately concluded a contract with Oscar Droege to plant 2,000,000 trees in the valley of Mexico, the work to be completed in four years. The trees specified are chiefly ash, poplar, acacia, and mountain cedar. It is the intention to form national nurseries, in which the study of scientific forestry can be carried on.

AN IMPORTANT QUESTION.

During a debate in the House of Commons on May 7th on the proposed Agricultural College, Mr. Fisher said:—

I wish also to make one remark with regard to Manitoba and the Northwest. I quite agree that in that region special experiments are required which cannot possibly be carried on at Ottawa, for example with regard to forestry. That is a question of enormous importance to the Northwest, and, indeed, to the whole of Canada. We must find out what trees are best adapted for cultivation in that country, whether for verdure or for fuel, or for windbreaks, wherever they may be required. In our eastern provinces we still boast of being a great lumber country, but before many years we shall be unable to make that boast any longer, and the question of forestry is likely to be a vital one in the eastern provinces. In the Northwest, especially, it is absolutely essential that experiments should be conducted with a view to ascertaining the best way of cultivating trees for windbreaks and other purposes. That cannot be done on a small scale, it cannot be done at Ottawa, and I believe that, also, will have to be done in the way I propose for other experiments, that is, all over the Dominion. The Government should appoint in different parts of the Northwest territory individuals who may be depended upon, who have been recommended for their intelligence and for their eagerness in carrying out this work, who will have to be asked to try the experiment of planting in their own locality, whatever trees are most likely to flourish in that region. For instance, there is a certain tree, the willow—that will serve the purpose of a windbreak all over the Northwest.

THE LOMBARDY POPLAR.

The poplars form one of the execptions to the rule—often stated without qualification in botanical text-books—that roots do not produce leaves or leafy shoots. This charateristic is most obvious when one of these trees has been felled, for then all the vitality that before spread from the roots into the main stem is diverted into the far-reaching lateral roots, and a small forest of suckers spring up, often at a distance of many yards from the parent tree. These are true root-suckers, and not merely ascending subterranean branches, like those of the rose; and as has been seen in the table just given the leaves on these suckers are often different in form from those on the branches of the tree. Though a merely "fastigiate" habit is not considered a character of specific importance, the presence of these suckers in the Lombardy poplar is an important distinction between it and the black poplar, with which botanists generally unite it. The absence of the grey hairiness common on the leaves of other species, which has earned for its allied form the inappropriate name of "black," is equally characteristic ef the Lombardy poplar. This fastigiate variety is probably a native of the mountains of Western or Northern Asia, perhaps of Persia. It has been common in that country, and in Cashmir and the Punjaub, from very early times, and is often planted along the roadsides in those distant lands, as is in France, its somewhat scanty shade-producing powers being there of more importance than they are with us. Introduced from these countries into Southern Europe, the tree derives its popular names, both in France and in England, from its abundance along the banks of the Po and the other rivers of Lombardy, where at the present time it grows readily from self-sown seed, which it will not do in England.—*From "Cassell's Familiar Trees."*

A SAW MILL NOVELTY.

Plans are now being prepared for the proposed new saw mill to be erected at Loring, Alaska, for the Alaska Salmon Packing Company, which contains some new features in mill building as well as possible improvements in other directions which deserve attention.

The mill is to be built to straddle a waterway about eighty feet in width, separating the mainland from a small egg-shaped island, which, with its smaller end pointing towards the shore, divides the main channel of Naha Bay from Freshwater Cove, a false inlet almost circular in shape, and about half a mile at its greatest diameter. The mill so built will thus have a berth for one or more vessels at either end, and will have in the cove a natural boom for the logs.

Though there is ample water power (estimated at 200 horses) in the stream that tumbles into the cove at its northern end, it is thought better to put steam into the mill rather than carry the water the necessary distance of about half a mile to the mill.

The mill is to be a band saw-mill, with all necessary adjuncts, and the addition of several Blanchard lathes, designed to turn out oars, banisters and other staple articles, for which the peculiar close grained, tough and tenacious yellow cedar of Alaska is especially adapted, experiments having proved the superior strength and lightness of an oar made from this timber over those made from the best Eastern swamp ash, while the refuse can be put to profitable use in making standard styles of stair rails, balusters, net floats, etc.

There is to be very little shafting or belting in this mill, as nearly every tool will have its own Westinghouse engine, which will be coupled direct, wherever practicable, thus doing away with the present system of line shafting and its attendant evils entirely.

The saving in material, friction, oil and supervision is estimated to cover the extra cost of the small independent engines, while the ease and facility with which one part of the mill can be run while all the others may be at rest, is a very important consideration, second only perhaps to the other one, which is, that any Siwash of ordinary intelligence and limited experience can attend to his engine and machine, with no interference and only cursory supvision.

Steam is to be furnished by a battery of plain cylinder boilers with conical heads. The consideration of safety is superior to any desire to save fuel, as the abundance of the latter is more a source of annoyance than of profit.

Work is to be begun at an early day, and it is expected that a profitable market for nearly ts entire outfit will found in the territory. The labor is to be almost entirely drawn from the native sources, for whose benefit it is principally intended, and as an adjunct to a mechanical training school to be erected at Loring by the Department of the Interior Bureau of Education. An agreement between Sheldon Jackson, Esq., agent for the Department in Alaska, and Mr. Max Pracht, calls for the aggregation at Loring of the three native villages now located at Skowls, Tongass and Cape Fox, Loring being a more desirable and central point, as well as a regular post office. Employment can be furnished in the various departments of the fishery and mill to a large number of intelligent and industrious natives.—*Ex.*

NEW FURNITURE FACTORY.

The name of another firm can be writen on the list of Peterborough manufactures. The Lindsay-Seldon Furniture Company is a firm which have embarked in the enterprise of manufacturing a finer class of furniture for the Canadian trade. Their place of business is located on Mill street, in the two upper flats of the large building erected by the Dickson Company last year. The new firm have fitted up the premises in a suitable way. Machinery of the modern type has been put in, consisting of band saws, shaping machines, planers, etc. On the third flat of the building the finishing room is situated. On the fourth flat the principal machinery is located. On this flat, also, a furnace supplies heat for the glue chest on the same flat, and for the dry kiln in the loft, where lumber is freed from all dampness.

The company have already commenced operations, and have turned out several sample sets, which are to be photographed in a few days. Their furniture is to be all made from designs worked out on the premises, and not from stock designs, as is too often the case. Mr. Seldon, himself, is the designer, and in this capacity has made a high reputation for himself. The sample sets, now finished, are very handsome. The walnut is well finished and ornamented by considerable hand carving and French veneer. The capacity of the factory is twenty-four complete sets weekly.

TUG FOR SALE

Now on Georgian Bay. Gross tons, 56.99; Length, 70 feet; Breadth, 15 feet; Depth, 8 feet. Was Re-built last Summer. Apply to

FOR SALE

VALUABLE

Timber Limits

AND

50,000 SAW LOGS

ON SEVERN RIVER

The undersigned being desirous of confining their operations to their Lakefield Mills on the Trent waters, offer for sale the following limits:—

Township of Hindou, 70 square miles.
" Oakley, 45 " "
" Redout, 22 " "

An area of 137 square miles.

These limits are estimated to contain 180 million feet of Logs, well watered, and afford means of short hauling from all points, and quick and cheap driving to Georgian Bay. Are offered for sale together with plant, depots farms, 1,200 acres deeded lands and 50,000 logs, nearly all of which are on the main river, a large proportion of which are 16 feet long. Apply to

R. & G. Strickland,

3mL LAKEFIELD, ONT.

SAWDUST IN RIVERS.

In the House of Commons on April 30th quite an interesting debate took place on a bill introduced by the Hon. Mr. Foster repecting the protection of navigable waters. One of the objects of the bill was to provide for the prosecution of saw mill owners, who put rubbish and sawdust into rivers, thereby injuring the fishing business and interfering with navigation.

Mr. Cook pointed out that the Ottawa river was exempt from this clause.

Mr. Mills thought the Government was going beyond their jurisdiction when they interfered with Provincial matters.

Mr. Cameron (Victoria) agreed with the member of Bothwell.

Mr. Mitchell said it was a subject which had occupied public attention for many years. When he was Minister of Marine and Fisheries, it was agitated a great deal, and steps were taken to try and prevent the evil. He was in entire sympathy with the honorable minister in his efforts to get additional powers in relation to this matter. It is painful to see the way the Ottawa river was being destroyed, not only by sawdust, but by the slabs, refuse and bark thrown into it. The latter are quite as, if not more, injurious than the sawdust. When you reach Carillon or Grenville by steamer, in order to take the cars there, you will see at either place, forty or fifty acres of sawdust banks, the accumulation of refuse from the Ottawa mills. That should be put a stop to. In other portions of the country it is not allowed to exist. Take one of our greatest lumbering and manufacturing sections, that of Miramichi, from which he came, every mill owner there has his furnace for burning sawdust and the refuse from his mills, and by that means we have kept them out of our rivers, and our navigation such as it is has been largely preserved by the regulations established by the department for the purpose of preventing sawdust and refuse being thrown into the river. It was iniquitous the way in which the Ottawa river was being destroyed, and he was in entire accord with the Minister of Marine and Fisheries in his endeavor to get additional powers in this respect.

Mr. White (Renfrew) was glad to see that the Minister of Marine and Fisheries had reserved to himself the right of exempting from the provisions of this clause in cases where it may be deemed not against the public interest to allow sawdust to be conveyed into streams. Some reference had been made to the fact that sawdust is allowed to be conveyed into the Ottawa by mills in this vicinity. There are two sides to this question. There is the question of navigation, which is a very important one, and which ought to be paramount in connection with the navigation of these streams, but there was also the question of the interest of those people who have a very large amount of capital invested in the construction of saw mills, giving employment to a very large number of persons, who would be subject to enormous cost and great inconvenience, especially in a place like the city of Ottawa, in disposing of their sawdust in any other way than that in which it is now disposed of. That was not a new question. It engaged the attention of the Government of the honorable member for East York, when he was leader of the Government and Minister of Public Works, and, a commission was appointed, either in 1876, or 1877, to inquire into the question of the obstruction of the Ottawa river by the depositing of this mill refuse, and, as the result of the investigations of that committee or commission, the practice was allowed to be continued under certain conditions and restrictions—one of the con ditions being that all the slabs and edgings had to be converted into small chips or pieces by machinery placed in the mills. It would be a great and serious inconvenience and a great loss to the laboring population of this locality, if the power were taken away from the Minister to exempt certain localities from the provisions of this act, if, in the wisdom of the Governor-in-Council, it was deemed expedient and proper that those localities should be so exempted. It was quite true that there have been banks of sawdust formed in the Ottawa below the mills; but, as far as his observation had enabled him to judge, those banks have accumulated, not in the navigable portions of the stream, not in the deep water, but along the shores and in the eddies, and so they have not obstructed the navigation to any appreciable extent, though they show themselves in passing down the Ottawa. He ventured to express the hope, and to concur with the opinion of the member for Charlotte (Mr. Gilmour) that this portion of the act shall not be expunged from it, but that the power shall be continued to the governor in council to make exemption where it is thought necessary to do so.

Mr. Hilliard thought that if mill owners were prevented from putting in slabs and edgings into the river the sawdust would not do much injury. If the act was inforced in its entirety it would result in closing down the mills.

Mr. Vail said that the bill was legislating against the smaller mill owners in favor of the larger ones. He objected to making any exceptions in the case of any streams.

The bill was read a second time.

CAN'T KEEP ANYTHING.

When a careful workman is noticed making use of more than half his time in looking for what few tools he may be permitted to work with, or some one of the parts of a machine he is to repair, either he is slightly inclined to be forgetful, and fails to take notice where anything is left when he is through with it, or some one who is a privileged character is assisting in the disarrangement of an orderly shop. It must be the latter, for overy mechanic has no trouble in finding plenty of victims who must have encroached on forbidden territory. Such a simple thing as a belt lace is a handy thing to have and it is a source of pleasure to come across a workman who has a number of them carefully laid away in his workbench, with a belt punch and belt-awl in working trim. A long twist-drill, with a fluted reamer to follow, and a hardened and lathe-arbor make a nice set to keep by themselves whenever their size is mentioned, were it only possible to keep anything; but the belt-punch vanishes the very moment it is wanted for use, and the drill in the arbor set is diminished by one half its length in the pleasure of trying a cut in the boring mills. Not even the varnisher is permitted to keep a vial of shellac varnirh, a little reducing fluid and lamp black where they will be handy without the brush walking off with a dish of asphaltum when a neat little pattern is ready for a coat of blacking. No forgetfulness here; only a slight inclination to disseminate throughout the whole establishment, and out into the back yard. The lock and key is called for and an inventory taken every fourth hour of the day, which serves to brighten up the memory. More than half the time the missing tool is just where the finder had left it, and a little attention in the beginning would have saved time and trouble.

The man at the work bench, or the polisher at the lathe will have tools by the dozen that he can lay his finger on without noticing where he is to reach for them, simply for the reason that they are returned to the same place again though they are scattered waste pile. Out of all the explanations, in which lost, strayed and stolen figure conspicuously, the one "I know nothing about it," or "It's where you used it last," has done more toward fitting up a tool room where a check stands ready to account for every tool that is missing than the consoling advice "Have a place for everything and have everything in its place," as it is more in accordance with the nature of a mechanic.—*Boston Journal of Commerce.*

HARDWOOD INSPECTION.

The New York Lumber Auction Company's rules for the inspection of hardwood lumber are as follows:—

WALNUT.

The standard lengths are 12, 14 and 16 feet.

The standard lengths are §, 1, 1¼, 1½, 2, 2½, 3, 4 and 5 inches; and is inspected as firsts, seconds and culls.

FIRSTS.—Must not be less than 8 inches in width free and clear of all defects. 12 inches wide may have 2 inches of bright sap on one side. Boards 10 feet in length must be 10 inches over in width and clear, to be classed as a first. In wide boards a few small defects will be allowed.

SECONDS.—Must not be less than 5 inches in width. All pieces 5 inches wide, 10 feet and over long, must be free from defects. At 6 and 7 inches wide, one defect may be allowed. At 8 or 9 inches wide 2 defects, and 10 to 12 inches wide 3 defects, but in extra wide lumber a few more defects may be allowed.

CULLS—Any broad. regardless of width or length not up to the standard of seconds, and where half the piece is fit to use.

NEWELS—Must be without heart or defects any kind. 5x5, 6x6, 7x7, 8x8 and 9x9 are the most used; the regular length being 3½ and 4 feet; but 12, 14 and 16 feet are the most desirable.

BALUSTERS—Must be strictly squared to 1½x1½, 2x2, 2½x2½, 3x3 and 4x4; the regular lengths being 28 and 32 inches free from all defects.

ASH

The standard length are 12, 14 and 16 feet.

The standard thicknesses are 1, 1¼, 1½, 2, 2½, 3, 4 and 5 inches; and is inspected as firsts, seconds and culls.

FIRSTS—Must not be less than eight inches in width, and free from all defects. 12 inches and over will admit of 1 or 2 small defects, and a split of 12 inches will be allowed.

SECONDS—Must not be less than 6 inches wide. 10 inches wide may have at the most, 3 small sound knots. Additional small defects will be allowed according to the width of the board, but must be free from all doty and rotten spots.

CULLS—Any board, regardless of length or width not up to the standard of seconds, and where half the board is fit for use.

CHERRY.

The standard lengths are 12, 14 and 16 feet.

The standard thicknesses are 1, 1¼, 1½, 2, 2½, 3, 4, and 5 inches; and is inspected as firsts, seconds and culls.

FIRSTS—Must not be less than eight inches in with, free and clear of all defects. 12 inches wide may have 2 inches of bright sap on one side. Boards 10 feet in length must be 10 inches and over in width to be classed as a first. In wide boards a small defect will be allowed, but those having gum specks are positively excluded from this grade.

SECONDS—Must not be less than five inches in width. All pieces 5 inches wide, 10 feet and over long must be free of defects; 6 and 7 inches wide one defect will be allowed; 8 and 9 inches wide 2 defects; and 10 to 12 inches wide 3 defects; but in extra wide lumber a few more defects may be allowed.

CULLS—Any board, regardless of width or length not up to the mark of second, and where half of the board can be used.

OAK.

The standard lengths are 12, 14 and 16 feet.

The standard thicknesses are 1, 1¼, 1½, 2, 2½, 3, 4, 5 and 6 inches; and is inspected as firsts, seconds and culls.

FIRSTS—Must be 8 inches and over in width, clear and free of all defects. Small defects allowed in accordance with the width of the board, but boards having worm holes absolutely excluded.

SECONDS—At eight inches in width from 1 to 2 small sound knots or a little sap may be allowed; and at 10 inches and up other small defect may be allowed according to width of board.

CULLS—Any board that is wormy, knotty and unsound generally. No demand at all for this grade.

WHITEWOOD.

The standard lengths are 12, 14 and 16 feet.

The standard thicknesses are §, 1, 1¼, 1½, 2, 2½, 3, 4, 5 and six inches; and is inspected as firsts, seconds and culls.

FIRSTS—Must be 10 inches and up in width, free from all defects. 12 inches and over in width a little bright sap may be allowed.

SECONDS—Must not be less than 6 inches wide; and from 6 to 7 inches must be free of defects with a little bright sap allowed on one side; and 10 inches and over from 1 to 3 small sound knots.

CULLS—Any board having black sap, knots, and not up to the grade of seconds generally.

SQUARES—Must be free from splits, shakes, and hearts. The general lengths are 12, 14 and 16 feet, and in some cases 10 feet is saleable. The general sizes are 4x4,5x5, 6x6, 7x7, 8x8, 9x9 and 10x10.

BASSWOOD.

The standard lengths are 12, 14 and 16 feet.

The general thicknesses used are 1, 1¼ and 1½; and is inspected as firsts, seconds and culls.

FIRSTS—Must not be less than 8 inches, free from all defects.

SECONDS—Must not be less than 6 inches; at this width must be clear, but from 7 inches and up small defects are allowed according to the width of the board.

CULLS—Any board, regardless of length or width having black sap, knots and other imperfections, and not up to the grade of seconds.

MAPLE.

The standard lengths are 12, 14 and 16 feet.

The standard thicknesses are 1, 1¼, 1½, 2, 2½, 3 and 4 inches; and is inspected as firsts, seconds and culls.

FIRSTS—Must be 8 inches and over in width, free and clear from all defects; slight allowance being made according to width of board.

SECONDS—Must not be less than six inches in width, and admitting 1 sound standard knot. Increased defects allowed according to the width of the board or plank.

CULLS—Any piece of defective lumber, not up to the grade of seconds, in which half the board can be used.

CHESTNUT.

The standard lengths are 12, 14 and 16 feet.

The most desirable thicknesses are 1 and 1¼ inch.

This is inspected and graded the same as walnut with the exception of wormy boards which will reduce them in grade.

SQUARES—Must be fully squared to 4x4, and free from heart and shakes.

BUTTERNUT.

The standard lengths are 12, 14 and 16 feet.

The usual thicknesses are 1, 1¼, 1½, 2, 2½ and 3 inches.

This is inspected and graded the same as walnut.

All wormy and otherwise defective boards not up to the mark for seconds, are classed as culls; and are positively unsaleable in this market.

THE past winter, says the Sherbrook, Que., *Gazette*, has been one of the great activity here at the pulp mills, whcih any one can readily see judging by the immense stock of pulp wood, fuel wood, which is in the yards of the company. They have also some 3,000,000 ft. spruce logs on the Bank of the St. Francis river for the saw mill. The mill is running day and night to its fullest capacity. and, as usual, without mishap. There is not a pulp mill in Canada which can show such a successful running record as the East Angus chemical pulp mills.

THE Kingston *News* says:—The Government will be wanting in its duty if it does not check this losing game at once. Let a good stiff export duty of $4.00 per thousand be put on saw logs, and probably the enterprising American, who has captured 500,000 acres of our timber land, will find his patriotism succumb before the prospective loss of $2.00 per thousand on his timber."

JAMES MCLEISH, of Sebright, a river driver in the employ of the Longford Lumber Company, was drowned, while breaking a "jam" in Tollman's drive on Black river. Finding himself unable to reach the bank after he had disengaged the key piece, the poor fellow determined to go down the rapids with the logs, but he had scarcely started when he suddenly disappeared.

DANIEL TAYLOR, over 80 years old, of Schroon Eake, N. Y., a year or two ago had his hand mangled by a circular saw. He got well of that and last winter he had his skull fractured while at work in his mill. He has fully recovered from that also, and is again ready to tackle a buzz saw or stand a crack on the head.

THE log imput on the Winconsin and its tributaries for the season now closed, it is said, was 166,787,000 feet. Of this amount Wausau parties claim that 137,000,000 will go to that place for sawing.

Chips.

EDWARD MERRITT was killed at Alma by a falling log.

MCKILLOP'S saw mill and logs at Wallacetown, Ont., have been destroyed by fire.

THE mills at Ottawa started work with full gangs. Laborers receive from $1.25 to $1.50 per day.

THE Canadian Pacific railway is build an elevator at Toronto, Ont., with a capacity for 250,000 bushels of grain.

IT is estimated that over 40,000,000 feet of lumber is now (May 4th) *en route* to the English and American markets.—*Ottawa Journal.*

MESSRS. Corey Bros. have just planted a row of young black walnut trees along the roadside at Stanbridge East, Que.

H. B. RATHBUN & SON, the lumbermen of Deseronto, Ont., purpose to put on a line of side wheel steamers between Belleville, Ont., and Ogdensburg, N. Y.

A MAN named Joseph Bouchard, from Drummondville, Que., was drowned at Kingsbury, in Melbourne township, on 23rd April, while engaged in driving logs down Salmon creek.

IT is reported that Mr. Grandbois, of St. Anne de la Perade, has sold his cut of spruce deals at $40, $24 and $22 for firsts, seconds and thirds, to be delivered at Batiscan.

THE following vessels are said to have been chartered by Messrs. Price Bros., Quebec, to carry lumber to St. John's, Newfoundland, at $4.50:—Schrs. J. Savard, Marie Erzelie, Ste. Anne, Marie Vigilante, C Berner. and Marie Anne.

BEFORE Easter 2,000 dozen of eggs were shipped by one lumber firm of East Saginaw to their camps in the woods. Thus, says the *Northwestern Lumberman*, it will be seen that the monopolistic pine men are not unmindful of the religious wants of their employees.

F. W. GILCHRIST, of Alpena, Mich., has purchased the propeller Alonson Summer, which is 135 feet long, 24 feet wide, with 11 foot depth of hull. She will probably tow Gilchrist's yacht, the mammoth log barge, that is to take pine from the Canadian north shore to Alpena.

THE Resolute cleared from Deseronto on Wednesday morning at 7.45 o'clock, arrived at Oswego, discharging her cargo of 330,000 feet of lumber and was in Deseronto at 5.45 on Thursday morning. That beat the record, and Capt Cowan is confident that he can yet reduce the time for the round trip.—*Tribune.*

GORDEN GIBSON, of Macaulay, Ont., was drowned in Sharp's creek on the evening of his first day's work on the river this season. He was going to the shore, and in attempting to jump from a log to the shore by means of his pike pole, he was struck in the stomach by the end of the pole, fell into the water, sank and was drowned.

THE *Timber Trades Journal* of April 17th says:—Some vessels forming a portion of the Quebec fleet left the Tail-of-the-Bank for the outport this week. They carry coal at a freight it is stated of 2s. 9d. a ton which will just pay for the loading and discharging. The fleet is later this year in leaving the Clyde. Freights, Quebec to Clyde, about 18s. per load.

ON April 21st, Mr. J. B. Millar, President of the Parry Sound Lumber Company, made an attempt to reach Penetanguishene or Midland with the Company's tug *Minnehaha* and got as far as "Big Gull Rock" and was then obliged to turn back owing to the ice still being firm beyond that point for some two miles. Mr. Miller wasof the opinion that in a few days navigation would be open.

BIG piles of white poplar wood, said to be largely used in the manufacture of paper, were drawn out in the winter, and deposited along side the Central Ontario railway track in many places, but the piles are very conspicuous in the vicinity of Big Springs and Central Ontario Junction.

THE Chignecto *Post* says that the lumber drives in Nova Scotia are getting along finely, notwithstanding the scarcity of rain. B. Young & Son have ten miles of river full of logs, and expect to get every log cut. In Apple river drives are doing well, and all along the shore is the same story.

A GANG of 130 choppers, hewers and laborers were forwarded, on May 3rd, from Toronto *en route* to British Columbia. The men were chiefly lumbermen who were recently employed in the lumber woods in Ontario. They will be engaged for the first five or six months in erecting snow sheds for the C. P. R. at the Rocky Mountains.

JOSEPH HURL, while running the bark elevator in the Georgian Bay Lumber Company's mill, at Port Severn, Ont., had his leg caught in the chain and it was severed, being torn off midway between the knee and the foot. He died from the effects of the injury and the shock. The mill shut down on the day of the funeral.

A WISCONSIN lumberman was caught by a rolling log, the other day, and held so fast that he was unable to get away. He yelled in vain for help. While lying there a big bear came up to him. He drew a revolver and fired six shot killing the bear, and these shots were heard by a lumberman, who went to see what was going on and released the prisoner.

WE learn, says the Monetary *Times*, that a new firm composed of Messrs. McCol, Boyle & Wilson, has commenced business in Toronto as wholesale lumber dealers and manufacturers. The firm named, it appears, has just closed the purchase of 4,000,000 feet ef dry lumber, manufactured last season by the Georgian Bay Lumber Company, at Collingwood. This has long been looked upon as one of the choicest and best assorted stocks on the Georgian Bay. The firm's mill, at Huntsville, is to commence operations this week with a capacity of over 3,000,000 feet per annum which will be ready for shipment on the opening of the Northern & Pacific Junction line.

It is a fact that can be verified evywhere that West's Cough Syrup is the only compound known to scienceb that can eradicate the seeds of consumption in its early stages, and completely cure Coughs, Colds, Asthma, Bronchitis and, all Throat and Lung difficulties. Sold by J. D Tully, druggist. Price 25 cents, and 50 cents and $1.00 per bottle.

Scott's Emulsion of Pure Cod Liver Oil With Hypophosphates.

Possesses the remedial power of these two valuable specifics in their fullest degree. Is prepared in a palatable form, easily tolerated by the stomach, and for delicate, sickly children, emaciation, consumption, and all impoverished conditions of the blood is unequalled by any other remedy.

Health is Wealth

DR. E. C. WEST'S NERVE AND BRAIN TREATMENT, guaranteed specific for Hysteria, Dizziness, Convulsions, Fits, Nervous Neuralgia, Headache, Nervous Prostration caused by the use of alcohol or tobacco, Wakefulness, Mental Depression, Softening of the Brain resulting in Insanity and leading to misery, decay and death, Premature Old Age. One box will cure recent cases. Each box contains one month's treatment. One dollar a box, or six boxes for five dollars; sent by mail prepaid on receipt of price. We guarantee six boxes to cure any case. With each order received by us for six boxes, accompanied with five dollars, we will send the purchaser our written guarantee to refund the money if the treatment does not effect a cure. Guarantees issued only by J. D. TULLY Druggist, Sole Agent for Peterboro

LUMBER DRIVERS' CALKS

PAPER, ENVELOPES, PENS, INK and PENCILS.

And every house and office requisite always kept in stock, and sold retail in

BOTH SMALL OR LARGE QUANTITIES.

☞A LIBERAL DISCOUNT will be allowed to Bankers, Lumbermen, Manufacturers, Clergymen, School Teachers, Township Officers and others buying their Stationery in larg quantities, and also to cash buyers. ☞Estimates given and contracts made for yearly supplies at lowest rates

Market Reports.

TORONTO.

From Our Own Correspondent.

MAY 10.—Lumber is moving briskly on the local market. Over the docks the amount going off is small. The accumulations of the winter will soon be all shipped away and our docks clear once more, and the quantity still to arrive from the mills north of us, of last season's cut, will be cleared out long before this season's cut is fit to move. Stocks to be cut this year are being rapidly bought up, and competition on this market is as keen as it ever was. Another new firm, that of McCool, Boyle & Wilso, have opened out to do a wholesale trade. The senior member of the firm is well-known in lumber circles here, and all the members of the firm are known as energetic men, and, will doubtless, do a thriving business. The figures quoted by retail dealers at their yards are not up to what they should be, in order to give a fair living profit, under the strict rules now in force by the railway companies, in weighing all cars of lumber, retailers cannot hope to stock up again at the same figures they have done hitherto. Nine-tenths of all the lumber coming into our city arrives by the N. & N. W. R. R. and the Canadian Pacific, and Grand Trunk companies, have managed to cajole or bully the former company to agree to an iron clad arrangement whereby all cars are to be weighed by an independent man, appointed by the three roads. Of course the latter two companies knew quite well that the lumber traffic forms but a small portion of their total earnings, so that if they could only rope in the N. & N. W. R. R., whose revenue is mainly made up by that branch of industry, they had all to gain and nothing to risk. The head officials of the N. & N. W. so aptly termed "Parlour Officials," by the *Globe* the other day, have never been noted for their large amount of wisdom, but there are few but gave them credit for more than they have displayed in this transaction. As mentioned in one of my former letters, there is a large amount of hemlock awaiting manufacture on the line of the N. & N. W. Road, and in localities where the pine is all cut off. During the last year or two at least 10 per cent. of the green bill stuff brought here by their road has been green cut hemlock. This portion of their revenue they have completely cut off, as no sane man can believe that such lumber can be freighted here at 9 cents per hundred weight. The lumber industry has stood a good deal of choking in the past, but it is possible to produce strangulation, and so far as the hemlock trade is concerned this has been done most effectually, and any man or set of men running a corner grocery, would be thought fit only for the asylum if they were guilty of such stupidity. The lumber industry has hard work, and uphill work, to hold its own, without any such stupid blunders as this being added to the many difficulties it has already to encounter. If the company have any interest in the lumber industry, and they doubtless know that their road would be absolutely nothing without that carrying trade, let them now make a special tariff for hemlock and other low-priced woods. This would in some part atone for the extra money now being forced from the lumbermen by the strict weighing process. If some such plan is not adopted they may find before long that they have strangled the goose that layed the golden egg. A good liberal man at the head of the N. & N. W. R. R. would soon place the company right with its patrons and at the same time add to the wealth of the institution. A cheese paring policy and hostile attitude to the true interests of the lumbermen will eventually prove disastrous to the interests of the company.

MONTREAL.

From Our Own Correspondent.

MAY 10.—Since the opening of navigation the harbor is beginning to wear its customary busy appearance. Seven ocean steamers are at present in port, but as yet no sailing vessel beyond the small river crafts have arrived.

Freight rates on lumber to the United Kingdom and ports in South America are only nominal, nothing having been shipped to these places as yet. The indications are that a large export trade will be done this season.

Business at the yards in retail lots has been more active, and although quite an improvement can be noted since our last report. The demand for car lots has been slow. Freight rates on the Grand Trunk and Canadian Pacific railways for lumber have been reduced 20 cents per M.

The water was let into the Lachine Canal on the 2nd inst., and up to date 4,810 M feet have been delivered ex-barges from the Ottawa.

A fair amount of building is going on in the city.

The following are the quotations at the yards :—

Long Beech "	5 00@5 50
Tamarack "	5 00@0 00

OTTAWA.

From Our Own Correspondent.

MAY 10.—Since I last wrote you a great fire has devastated the city of Hull—the very centre as one may say of the lumber employees of this district, for in Hull could the lumberman who was in search bush hands or mill operatives always find a supply. By the fire on Sunday last there were a great many families of lumber employees thrown out homeless on the world, and this bore the more heavily from the fact that, as a general thing, these people were all poor and by the fire lost their all in the flames. However, it is consoling to know that the lumbermen of the district rose in their generosity equal to the occasion and by liberal subscriptions, and the offer of all the lumber to those who desire to rebuild, free of cost. Two of the Chaudiere lumbermen are deserving of especial mention in this case, and these are John R. Booth and Mr. Perley, of the firm of Perley & Pattee, who each subscribed $1,000 towards the relief of the sufferers. It may also be noticed that all the lumbermen came down handsomely in the matter of subscriptions, but Booth & Perley head the list. It is now only a matter of short time before Hull will again rise from its ashes, for the lumber industry is of such an extensive nature that the city and its lumber employee inhabitants are so intimately connected that one depends on the other. Fortunately the immense lumber piles so close to the scene of the conflagration escaped unscathed, although at times it was feared they were doomed. Had the fire once got amongst them the loss would have been enormous.

The hum of the saw is now a continuous sound. Night and day the mills are turning out lumber and the fleet of barges transporting it to market are kept busy. The chief exports so far are to the American market.

The log and square timber drive on the upper Ottawa is now well forward for the season, and water is reported very plentiful in all the tributaries of the Grand river. There will be no danger of any of last year's cut getting stuck this season. The output of logs will be somewhat in excess of last year, and men employed are getting fully 25 per cent. higher wages than they commanded last year.

CHICAGO.

BY THE CARGO.

The *Northwestern Lumberman* of May 8th says :—The stoppage of business at the yards has practically closed out the cargo market for the time being. When the lockout occured last Saturday there were a few cargoes at the market docks, and some on the way in. But when the trouble broke, instructions were forwarded to shipping ports not to forward any more lumber until the lockout should be over. The commission men were left with several cargoes on their hands unsold, and how to dispose of them was the question. South Chicago, Racine, Evanston and Michigan City came to the rescue, and thus the stuff was absorbed as John McLaren said. A stander-around on the docks said, however, that he thought the slips out of the mouth of the harbor had absorbed a large part of it. Undoubtedly cargoes have been sold in the places named. It is positive that dealers in South Chicago have purchased several cargoes.

Piece stuff is quoted at $9.50 for green, but some concession has been made on loads that have gone to outlying ports. Several boats have been loaded for points down the canal.

There has been considerable inquiry for lath. Green lath is worth $1.25 a thousand, and dry from $1.40 to $1,00.

AT THE YARDS.

As it would be natural to conclude, under existing circumstances, the actual trade feature of yard business is minus. The lumber trade of Chicago is now on a war footing, as it were, while the peaceful pursuit of selling and shipping lumber has been for a time suspended. A few of the retail yards on the north side, in the remote parts of the city and in the suburbs, are doing some business in the delivery of lumber to carpenters, but as a general statement it can be said that the lumber trade of Chicago is for the present hung up. There is prevailing a combined lockout and strike, which affects the lumber yards, planing-mills and box factories. Fully 6,000 men are out of work in consequence of the trouble. The yard owners have combined and elected a strong executive committee, to which has been submitted the control of affairs until the trouble is ended. In case the strikers partially succeed, or are able to continue the trouble indifinitely, the majority of wholesale dealers avow their determination to quit business here—throw up the trade entirely, or seek other localities for the location of yards where labor troubles are less likely to occur.

It was reported on Thursday that all trouble at the South Chicago yards had disappeared. Lumber shovers were at work unloading vessels, and yard business was proceeding as usual.

Building permits continue to be issued in considerable numbers. There is less disturbance in the building trades than in other lines. Projections for new buildings still present an extensive array. Yet much work has been temporarily suspended, and the building industry may be called minimum. But if the existing labor troubles should measurably die out within a short time there would be renewed activity in building, the haste to push forward work being greater on account of the period of delay. The halt in lumber movement on account of strikes is almost sure to be succeeded by a time of intense activity, with a rushing demand.

Receipts of lumber and shingles for the week ending May 6th, as reported by the Lumberman's Exchange :—

LONDON.

The *Timber Trades Journal* of May 1st says: The long interval since Thursday—for Saturday may almost be included amongst the holidays—will tell its tale on the dock and yard deliveries, perhaps more now trade is in such a chronic state of inactivity than had matters commercial been of a more wholesome kind. If orders had been coming in pretty briskly, the man of business would begrudge every day spent from his premises as so much mony lost; and though possibly quite capable of enjoying himself on the days set apart for recreation, would be only too ready to get back again to work. In slack times the case is different, and it does not matter much whether the holidays are extended an extra day or so. Indeed, we expect that the disposition will have been pretty general to carry the pleasuring well into the week.

The money put in circulation at these holiday times, when, as this Easter, everything has been in favor of out-of-door recreation and enormous passenger traffic, cannot fail of having a good effect on trade; and some briskness in buying and selling may be looked for as soon as the effervescence is over and people subside again into their ordinary avocations. But, if the timber trade is to rally again this year, some symptoms of it may be expected to show themselves within the next week or two. As far as London is concerned, the import trade is likely to evince considerable activity this month, and the dock deliveries will be a good index to the rest.

Though it would be unsafe to predict a material change for the better in the trade of this season, there is, nevertheless, ample room for hope that the stagnation of the timber trade is pretty nearly at an end. Some good business will, no doubt, be done. Let us trust it will not be overdone. That apprehension apart, better business might soon be looked for.

The dock arrivals this week are not so active as they were in our last record. Only one pitch pine cargo has come forward—the Hermon, for Messrs. J. M. Ross & Co.—mostly sawn timber; and what came under our notice, being rafted from the ship's side in Canada dock, seemed of fair quality. Steamers have been coming forward freely, however, and two from Gefle are now discharging, or were at the time of writing these lines, in the Surrey Commercial docks.

In the Victor, a barque from Karlshamn, for Messrs. Churchill & Sim, discharging in Canada dock, we noticed on some of the deals considerable quantities of ice, so that the cold must have been pretty intense when they were shipped.

The sale on Thursday was well attended; in fact, it was just as we anticipated, everybody would be there, expecting to see nobody, and Messrs. Churchill & Sim must have been surprised themselves at seeing such a number of buyers present. Prices, however, did not exhibit any improvement, and there was very little disposition amongst those present to put their hands in their pockets for more than would cover the requirements of the existing moment; in fact, some goods went back visibly in the short interval between this sale and that of the same brokers on the 15th April, only a fortnight previously. At that sale Russian wainscot logs fetched 62s. 6d to 65s. (12 ft. and up), while on this occasion goods of apparently the same class and character, and even of the same mark, did not reach higher than 57s. 6d. and 60s., a difference of 8 per cent. against the later seller. The logs, however, were not the straighest we have seen, and to their indifferent character, rather than to market influences, must the big drop in prices be attributed.

The teak buyers appear to have supplied themselves so well on the former occasion that they did not want any more, and not a single lot was sold out of the twenty-two submitted, the reserve price being evidently a bar to business on these goods. Battens went poorly throughout, though now and again a lot sold well, notably the 2x4 scantling mixed at £7 15s, and the 4th at £6 10s, but this was not the general character of the sale. Rough boards seemed sought after, a good many small buyers being to the fore. 1x6 5th quality at £6 was not a bargain, and even at a drop of 10s. at which two of the lots were secured, they were by no means cheap. The Saguenay pine, ex Magnum, was well sold, but just now there is rather a scarcity of 3rd pine plank in the market, and this parcel had nothing very special to recommend it.

The Arendal battens went cheap, as also did the Pitea goods, ex Inverleith, yellow balks falling at 31s. a load, the deals by this ship going also much under cost. Mixed white 3x9 at £6 10s is rather a startling price! Let us hope it is of an exceptional character. The pitch pine ex Lillie Soullard went very low, none of the lots reaching £9. The two lots ex Lock Awe, Savannah stuff, were better done by at £9 15s., but we should think even at this they did not cover cost. Generally, the unreserved goods disposed of were ordinary description, so that we must not take too severe a view of prices. The sale terminated shortly before half-past three, and, so close upon the holidays, things might have gone feebler than they did. There was very little flooring offered, and prices seemed to hang a good deal.

LIVERPOOL.

The *Timber Trades Journal* of May 1st says:—As usual, during Easter week, little attention was paid to business, or, at any rate, it was followed by comparatively small results. Owing to the arrival of several cargoes of Norwegian flooring, the quays are fairly occupied, and of the new arrivals a good proportion is forwarded to the country under old engagements.

Two cargoes of Christiania poles and spars have come to a good market, as the stocks remaining in dealers' hands had become worked down to a very small margin, and a very large quantity of these goods will be wanted for the International Exhibition, and for decorations in the street during the visit of the Queen to this city.

Next week an auction sale of spruce deals, birch timber, &c., will be held by Messrs A. F. & D. Mackay, which will include some of this season's shipments; but for the following week no whitewood sale is announced, nor is it very probable that any well be held, as business will be considerably interrupted on account of the Royal visit, which extends over three days.

The is no change in prices of any of the principal articles in the market, the absence of any improvement in the timber trade being in contrast to other large branches of business in this city, though the consumption of spruce deals and flooring must have been considerably stimulated by the large quantities which have been used in the construction of exhibition buildings and the numerous adjuncts to it in various parts of the ground. Comparatively little of the heavier portion of the work now remains to be done, the contractors for the joinery, Messrs, Brown & Backhonse, of Liverpool, having nearly completed all the heavy work; yet there will still be employment for a great number of hands in finishing the uncompleted parts of the building, which will occupy at least another fortnight, and for which no inconsiderable quantity of timber and boarding will be required.

GLASGOW.

The *Timber Trades Journal* of May 1st says The principal arrivals at Clyde ports to note during the past week are cargo of teak and one of pitch pine at Greenock, a cargo of pitch pine at Port Glasgow, and two of mahogany at Glasgow. Since last writing there have been no auction sales held by timber brokers here, and business has been quiet. Deliveries of deals from Yorkhill yards for April have been much under those for same month last year, being 50,000 pcs. as against 85,353 pcs. in April, 1885; the aggregate for the first three months of this year was, however, equal to that of the corresponding period of 1885.

The first two of this season's Clyde and Canadia steam traders sailed from the Broomielaw her a few days ago, one, the Allen line screw steamship Norwegian, and the other a Donaldson liner, the Alcides, The entire import of Quebec and Michigan deals landed at Glasgow last year came per steam liners. The number vessels of the sailing or log timber fleet that have left Greenock for the St. Lawrence this year is very much under the tonnage that had sailed by this time last year their departure being later owing to the long continuance of frost over Canada.

The tonnage of the vessels launched from Clyde shipyards in April will be a larger total than the monthly returns have shown for some time back; exact figures not yet made up. On one day recently there were four vessels put into the water measuring in the aggregate 10,280 tons. The launches expected to take place in May are few.

TYNE.

The *Timber Trades Journal* of May 1st says:—The arrivals of the past seven days are mainly composed of pit-props, mining timber and battens from the south of Norway, one cargo of battens from Gothenburg per sailing vessel, which is a little unusual in these days of steamers, and also a cargo of staves and headings from Memel.

The Easter holidays having come in the way have interfered a good deal with business and prevented its onflow. What little there is to be done is, according to common report, of a very unprofitable nature, prices being cut down to the lowest possible limit.

Stocks are getting a little lower, and the better descriptions of redwood deals especially may be reckoned very low. Of common battens there are still very large stocks held, and they do not appear very sensibly to diminish.

A few ships are reported to have been chartered during the last few days at rates, on the whole, a little lower than those formerly quoted. 25s. from Hudikswall is reported to have been done, a rate which certainly must have reached the lowest depths.

WOOD-WORKING PATENTS.

The following list of patents relating to the wood-working interests, granted by the United States Patent Office, April 27th, 1886, is specially reported by Franklyn H. Hough, solicitor of American and Foreign patents, 925 F. Street, N. W., Washington, D. C.

340,660—Lumber drier—W. E. Cole, Montgomery, Ala.

340,943—Saw mill, band—C. Esplin, Minneapolis, Minn.

LUMBER SHIPMENTS.

The following is a complete list of the loaded barges by the respective forwarders, all of which will have left the harbour before Tuesday night:—

Blanchard & Williamson 10 barges for Montreal	2,175,000 ft.
D. Murphy & Co., 9 barges for Burlington and Whitehall	2,250,000 "
D. Murphy & Co., two barges for Quebec	500,000 "
D. Murphy & Co.,23 barges for Montreal	5,875,000 "
D. Murphy & Co., six American boats for New York	900,000 "
Bangs & Co., five barges for Burlington	1,268,000 "
Geo. A. Harris, eight barges for Burlington	1,875,000 "
Jas. Wood & Co., eight barges for Montreal	2,000,000 "
S. T. Easton, five barges for Kitgston	1,000,000 "

making a grand total of nearly eighteen million feet. Of this amount the following concerns loaded about as follows:—

	Barges.
E. B. Eddy	10
Gilmour & Co.	12
Lord, Hurdman & Co.	6
Bronson & Weston	3
G. A. Grier & Co	6
Perley & Pattee	16
J. McLaren & Co.	5
W. McClement & Co.	2
Ross Bros., Buckingham	4
W. C. Edwards & Co., Rockland	5
Hamilton Bros., Hawkesbury	2

The loading of these barges has given a week's employment to about one thousand laboring men, and has made quite a boom around the Chaudiere. The yards are still quite full and the forwarders are looking for a busy season. The following mills are now sawing:—Bronson & Weston, Gilmour & Co., Grier & Co., Perley & Pattee, and Lord, Hurdman & Co. Messrs. Booth & Eddy expected to start sawing on May 1st.

The following steamers left last night with their respective tows, viz.: Florence, with 8 barges, Montreal; E. B. Eddy, with 8 barges, Montreal; A. McMahon, 12 barges, Montreal.

The following will leave to-night: A. Gilmour, with five barges, Burlington; Icy, with 10 barges, Montreal, and on Monday night, G. A. Harris, with eight barges, Burlington; J. R. Booth and Elfin, with 18 barges, Montreal, Lake Champlain and New York.—*Ottawa Citizen May 1st.*

A NOVEL DESIGN IN STEAMBOATS.

Mr. A. P. Cockburn, M. P., General Manager of the Muskoka & Nipissing Navigation Campany, has just had a boat built on a new principle, from designs of his own, for use by his company. The boat was recently launched at Burk's Falls, Ont., and has been found to work admirably; indeed, the captain has telegraphed Mr. Cockburn that "she is a credit to her designer." She is best described as a combined paddle and screw general purpose steamer, and can run either with paddler or screw, or with both. In the waters were she will ply the channels are often blocked with logs, which seriously interfere with the passage of either paddle or screw steamers, as the logs get under the vessel, and if struck will injure either of the propelling powers, and the boat has to stop while the obstruction is cleared away. It is anticipated that it will be comparatively easy to keep the boat constantly moving by the use of either of her propelling powers when the other has to be detached. The detachment can by instantly made, or a change from screw to paddle, or *vice versa*, without delaying the boat. The boat is 96 feet long, 17 feet 9 inches beam, 27 feet over all, has 7 feet depth of hold, and draws 4 feet 6 inches of water. She is capable of maintaining a speed of thirty miles an hour. It is claimed for the vessel that she will prove one of the most convenient and and useful boats for her size and cost ever built.—*Railway Life*

Indians as Loggers.

Estimates of the log cut on the Court Oreilles Indian reservation, in Sawyer County, Wis., were too small. W. D. Stevens, the government scaler, furnished the *North Wisconsin*, of Hayward, the following statement: Callaghan Bros. cut 33,033 pieces scaling 6,671,860 feet; Dan McDonald cut 46,549 pieces, scaling 9,929,780 feet; Bergerson & Gaynor cut 16,588 pieces scaling 3,326,230 feet; Dobin & Stratton cut 119 660 pieces, scaling 27,573,240; making a total cut of contracted logs, or 47,499,120 feet. The logs were cut from 131 subdivisions belonging to individual Indians.—*N. W. Lumberman.*

AT the sale of timber limits held at Ottawa last week over $140,000 worth of property was disposed of, including a limit on the River Mattawa to Mr. Alexander Fraser for $62,000, also limits for $30,000 and $4,600 to the same purchaser, and a limit to Mr. J. B. Fraser for $5 200. Mr. A. Fraser also bought 344,000 cubic feet of square and wainey timber for $6,880; 357,551 do., $4,290; about 8,000 standard saw logs, $12,560, and about 140,000 feet sawn lumber, $11,900.

Sisters of Charity

Charity, attached to St. Mary's Infant Asylum, Dorchester, Mass., certify to the inestimable value of Ayer's Sarsaparilla in the treatment of sore eyes and skin diseases, among the many unfortunate children under their care. Mrs. S. D. Bodwell, Wilmington, Mass., writes concerning the treatment of her daughter, who was troubled with sore eyes, as follows: "I gave Ayer's Sarsaparilla to

My Little Girl,

and must say that she never took anything that helped her so much. I think her eyes never looked so well, as now, since they were affected, and her general health is improving every day. She has taken but half a bottle." A. J. Simpson, 147 East Merrimack st., Lowell, Mass., writes: "My weak eyes were made strong by using Ayer's Sarsaparilla." C. E. Upton, Nashua, N. H., writes: "For a number of years I have been troubled with a humor in my eyes, and was unable to obtain any relief, until I commenced using

Ayer's Sarsaparilla

may be "fairest and foremost of the train that wait on man's most dignified and happiest state," but the dignity and happiness of man cannot long endure without the health that may be obtained in a few bottles of Ayer's Sarsaparilla. A. W. Parker, lumber dealer, 209 Bleury street, Montreal, Que., writes: "After being troubled with Dyspepsia for a year, and with Salt Rheum

For a Number of Years,

I was cured of both diseases by using six bottles of Ayer's Sarsaparilla." M. G. Traine, Duxbury, Mass., writes: "I have found Ayer's Sarsaparilla an efficacious remedy for bilious troubles and Dyspepsia." Henry Cobb, 41 Russell st., Charlestown, Mass., writes: "I was completely cured of Dyspepsia, by the use of Ayer's Sarsaparilla." Wm. Lee, Joppa, Md., writes: "I have tried Ayer's Sarsaparilla, and it has done me so much good that I shall always regard it as the best of blood purifiers." Eminent physicians prescribe Ayer's Sarsaparilla. I believe it to be the best of blood purifiers."

in all cases requiring a powerful alterative treatment.

FOR THE

Canada Lumberman

IT WILL PAY YOU, Because :

1. It is the only newspaper published in the Dominion of Canada devoted to the lumber and timber industries.
2. It is devoted to the development and utilization of our forest wealth.
3. It furnishes complete and reliable quotations of prices of lumber in all the leading markets.
4. Its columns are filled with interesting reading matter, valuable alike to the land owner, manufacturer or dealer.
5. It costs only $2.00 per year to have it sent, post-paid, to any address in Canada, and no land owner, lumber dealer, manufacturer or individual in any way connected with timber industries, can afford to do without it.

☞TO ADVERTISERS.

It has a circulation among saw mill owners, manufacturers, lumber and timber dealers and all classes connected with the timber business.

Examine the field, count the cost, and you will at once decide that the CANADA LUMBERMAN is the

———CHEAPEST, BEST, MOST RELIABLE and ONLY TRUE MEDIUM———

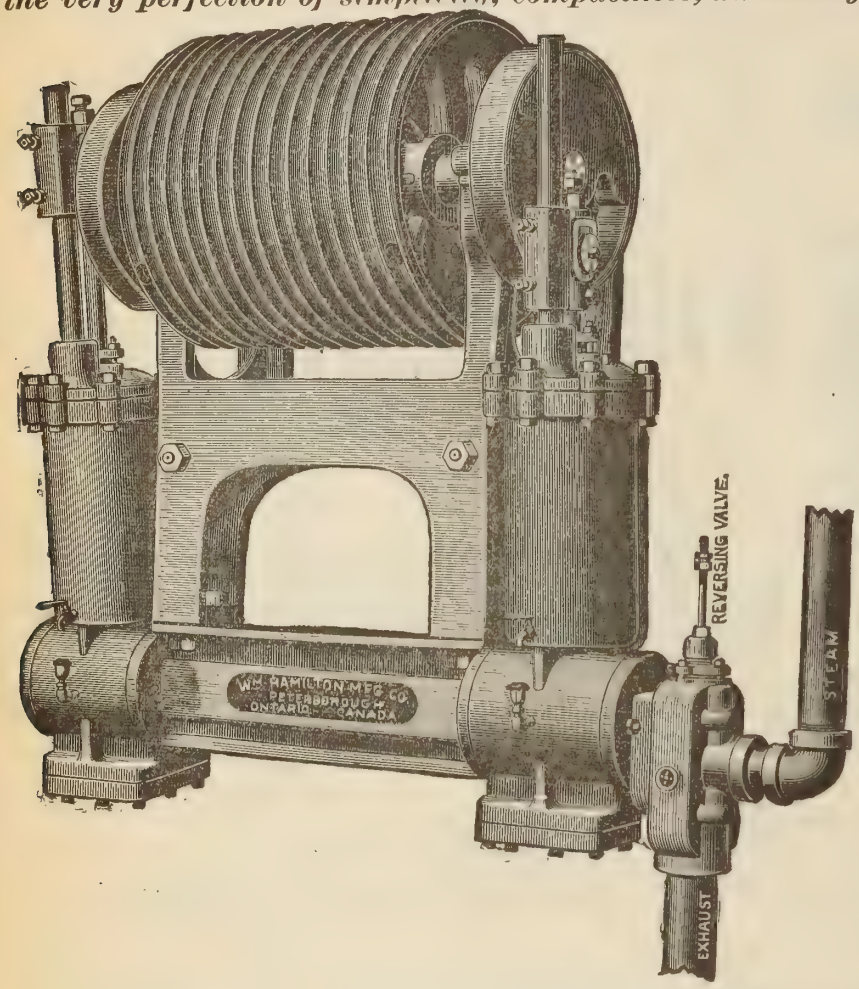
for placing your goods or wares before the saw-mill men and lumber and timber dealers of the Dominion.

CUNNINGHAM'S

PATENT OSCILLATING TWIN ENGINE

FOR STEAM FEED IN CIRCULAR MILLS WITH RACK OR ROPE.

This Engine has practically but two moving parts, aside from cranks and shafts. The whole array of eccentrics, valves, valve rods, connecting rods, cross heads, slides, levers, rock shafts, bell cranks, etc., is done away with, and the very perfection of simplicity, compactness, durability and cheapness attained.



The above engraving illustrates the Twin Engine, 10x16, for Rope Feed, for Saw Mill Carriages. The spool is 27 in. diameter, 30 in. face, is grooved 2 in. pitch for $1\frac{1}{2}$ in. rope. The shaft is steel, $4\frac{1}{2}$ in. diameter, with disk cranks. No connecting rods, eccentrics or valve rods to get loose and out of order. The ports are in the trunions, and worked by an oscilliation of the cylinders, and are held in their place in the downward motion by a steam cushion below. The sawyer's valve is a perfect balance, and by moving this valve the engine can be reversed, stopped or started almost instantaneously if necessary, as the sawyer has perfect control of it by his lever either to go fast or slow. Should the sawyer let go of his lever either by mistake or any other cause, it is balanced so that the valve will come to the centre and cut the steam off both cylinders and stop the feed. When standing, the lever is locked or fastended, so that is is impossible for it to start off itself. The engine stands upright below the carriage, and bolted to two upright beams, placed on the mill for the purpose. When a rack is preferred in place of the rope, we put on a steel wheel 30 in. in diameter, and the engine placed high enough to work into the rack on carriage bar, or if the beams come in the way, an idler wheel can be used between engine and rack segs; or, the engine can be placed at a distance and have a shaft rom it to the carriage; or it can be placed in the engine room, where it is under the control of the engineer for oiling, thence by shaft and pinion to carriage rack bars. These engines are well adapted for cutting long logs, or where the logs are mixed, the advantage of this feed will be apparent to mill men. When the carriages are used in two or more sections, the couplin and uncoup ling of each section is quick and simple.

There were two of these feeds working this summer and giving the best of satisfaction, one with rope feed at James Playfair & Co's Mill, Sturgeon Bay, near Waubaushene, and one at the new mill furnished by us to Francis Carswell & Co., at Calabogie Lake, on the Kingston and Pembroke R. R. This mill is working with the Rack and Pinion feed, and drops from fifteen to seventeen stock boards per minute. We have also sent one to the Rathbun Company, Deseronto, to put in to feed their heavy Circular Mills. They will also commend themselves for various other cases, especially for running Elevators, hoisting Engines, and wherever a simple and easily reversible motion is required.

We would also call attention to our Improved Band Saw-Mill for cutting logs

☞ ***We guarantee this to be the best Mill of its kind got up, and would ask any one wanting a good Band Saw-Mill to communicate with us. We would also call the attention of Mill Men to our new IRON GANGS, CIRCULAR MILLS and MILL MACHINERY. For further information, prices, &c., address the Manufacturers,***

VOL. 6. PETERBOROUGH, ONT., JUNE 1, 1886. NO. 11.

NEW BRUNSWICK FORESTS.

The New Brunswick Government has published an interesting work, written by Mr. Charles H. Lugrin, A. B., Secretary of the New Brunswick Board of Agriculture, on the resources, progress and advantages of that Province. The following is the chapter on the forest, continued from last week :—

ELM.

There are two species of elm in New Brunswick, the white and the red. Both are beautiful shade trees. The white elm often grows to the height of 100 feet, its branches are long and pendulous, its foliage rich and pleasing in shape. It grows wild on the low, deep soiled intervals, and the quantity available for commercial uses is limited. The wood is strong, tenacious and elastic, does not split easily, and bears the driving of bolts and nails better than any other wood. It is durable if kept either constantly wet or constantly dry, but decays rapidly when these conditions alternate. It is used in making ships blocks, and for other purposes in which wood of its peculiar properties is required.

The elm does not grow to as great a size as the white elm. Its wood possesses the same properties as that of the white elm, but is somewhat coarser and more durable. Its home is on dry elevated situations.

BUTTERNUT

is a species of walnut found along river banks It grows to a considerable size and yields in profusion nuts which are agreeable to the taste and very oily. The name of the tree is derived from the fact that the Indians formerly used to pound the nuts and having boiled them so as to separate the oil, used it with their food as a sort of butter. Butternut wood is light and of a reddish tinge, taking a high polish. It is used in making furniture, for wainscoting and other purposes. It is easily propogated and grows rapidly. There being a constant demand for the wood its cultivation would probably be found profitable.

ASH

is found in New Brunswick in several varieties, the white, black and yellow chiefly, the wood of each differing according to the soil and situation where it is grown. The white ash is a common tree growing to the height of sixty feet with a diameter of eighteen inches or more. Its growth is rapid and its foliage beautiful, the trunk is perfectly straight, the wood strong, tough and elastic. Black ash is a smaller tree than white ash and is somewhat coarser. It is a fashionable wood for bedroom furniture, its texture being very pleasing and is used for a variety of purposes in first-class buildings. Being already a valuable article of commerce, its supply will probably not long keep pace with the demand; its cultivation will likely be profitable. It is used by the Indians in the manufacture of baskets, for which it is admirably adapted. The yellow ash is similar to the black ash but is lighter in color. The red ash is somewhat similar to the white ash.

OAK

is found in New Brunswick in three varieties, the white, the red and the grey. The wood of the latter is very durable. The supply is limited.

CHERRY

is found in abundance. The fruit is small and slightly bitter. None of the varieties attain sufficient size to possess much commercial value.

POPLAR

occurs in two varieties, the Aspen and the balsam poplar, or "balm of Gilead." Poplar wood is very white and of light weight. It becomes hard and tough when dry and takes a high polish. Its principal commercial use at present is in the manufacture of what is known as Excelsior, an article used for mattress making, upholstering and packing purposes, the wood for these purposes being cut into long shreds. The demand is large and increasing. The lightness, whiteness and durability of poplar are causing it to become very much esteemed for many purposes. It makes an excellent paper pulp.

BASSWOOD

is found in considerable quantities. Its properties are somewhat similar to those of poplar. The natural color of the wood is pale yellow.

HORNBEAM AND IRONBEAM

are tough heavy woods capable of sustaining great weight. These trees do not attain a great height.

Alders willows and other inferior trees abound, but those above named constitute the principal part of the New Brunswick forests. It will readily be admitted that such forests must be exceedingly beautiful, and the soil which supports them of great fertility. Such is particularly the case with the deciduous trees, "the hardwood ridges," as they are called, that is the rolling hills covered with maples, birches and beeches, with a few scattered spruce and pine trees, not only making a most attractive landscape, but being generally, when cleared, the finest of farming land. But if these ridges are beautiful to look upon in the summer, they are resplendent in the autumn when the ripened leaves, after the early frosts, begin to change their color. The brilliant scarlet and other hues of the maple, the golden-yellow of the elm, the almost countless shades and tints of red, blue and brown, relieved by the sombre evergreens, make up a picture which the eye never grows weary of and words cannot describe.

GENERAL OBSERVATIONS.

Although for nearly one hundred years the forests of New Brunswick have furnished the greater portion of the exports of the Province, and the trees have been cut in a most lavish and wasteful manner, it is doubtful if their commercial value has yet been realized. It will be seen from the facts above given that the Province contains extensive supplies of wood, valuable for countless purposes. The forests are intersected by streams in all directions, and these with the railways furnish the best possible means of conveying the wood to the seaports, whence it can be shipped to the market. Innumerable water powers afford facilities for cheap manufacture, in fact all the elements exist requisite to make the Province the seat of very extensive wood working establishments, except the single essential of capital. A prominent architect of Liverpool, England, in a letter to Mr. Cornwall, agent of New Brunswick in England, after speaking of the adaptability of New Brunswick woods to numerous purposes in connection with buildings, said :—

"There must be a great advantage in making wood-work in countries where the woods are available, as well as cheap steam producers, besides the saving of carrying so much waste timber such a long distance, for at least one-seventh of timber imported is cut to waste in planing, sawing and refuse. The extra cost of carrying manufactured articles would, I judge, not nearly amount to the difference."

Large orders have been offered by English houses to manufacturing establishments in New Brunswick, but, for lack of capital, they have not been accepted. The *Monetary Times*, a commercial paper published in Toronto said :

"Great Britain and other European countries use enormous quantities of wooden goods, and they are largely made in the United States and shipped from Boston and New York. Why should not Canada, whose supplies of timber are nearer the seaboard, compete successfully? It can be done; but it is not to be done in a day. Nor is it to be done without observation and pains."

But it is not only to the European market that New Brunswick may look for the disposal of the products of its forests. In the United States the question of wood supply is becoming annually more serious, and the people of that country will shortly find themselves compelled to admit Canadian wood goods duty free. Already the tendency in this direction is unmistakable. It is evident, therefore, that the manufacture of all descriptions of wooden goods may be regarded as likely, at no distant day, to form an important industry in New Brunswick. Among the articles which may be advantageously made are building material for both inside and outside finish; shipbuilding, from the hull to the spars; agricultural and horticultural implements; waggons, carriages, sleighs; packing. salt, fish, and other boxes; tubs, pails, churns, step-ladders, furniture of all kinds, broom, hoe, pick, edge tool and other handles; clothes-wringers, washboards, clothes and towel horses, bench screws, Venetian blinds and slats, cloth boards and rollers; bobbin spools, ships' block, coopers work of all kinds; boot and shoe lasts, trees and crimps, musical instruments, railway ties, carving and turned work, wood pulp.

Several establishments are already engaged in the manufacture of various descriptions of wood goods, among them being the Quaco Wood Manufacturing Company, the Petitcodiac Spool and Bobbin Works, and the Woodstock Woodworking Company, and the establishment of the Flewwellings, at Hampton, and others, all of which are doing an excellent business. The attention of investors is directed especially to this industry.

To the settler in New Brunswick the existence of an abundance of the best of fuel and building and fencing material is an advantage which can scarcely be over-estimated. It is truly one of the greatest recommendations which any country can have. In addition to the value of the fuel for domestic use, the cutting of it for sale, particularly on land adjacent to the railways, is a profitable occupation, as will be seen by statistics given elsewhere. Wood for fuel is a not unimportant article of export to the United States, and the demand will no doubt largely increase. The New Brunswick farmer has for the labor of cutting it, the material for his buildings and fences, and an inexhaustible supply of fuel, and these considerations far outweigh any supposed advantage which the prairie farmer may have in preparing for his first crop. The experience of farmers in New Brunswick has clearly proved that the existence of the forest is one of the greatest advantages which the settler can possess. In the matter of fuel nothing but experience can tell the difference in comfort between the great fire of blazing logs which a New Brunswick farmer heaps up on a winter night, as much for the pleasure of looking at it as for warmth, and a smouldering fire of coal or of wood, so scarce that the pieces must be counted, which his brother in the Far West has to be content with When the logs blaze and crackle on the hearth, their streaming light illumining every corner of the room, what matter if the storm blows fierce or the mercury drops below the freezing point? So long as the forest lasts, and there is no reason why the preserved wood lots should ever be exhausted, the New Brunswich farmer need never fear the cold. The problem of fuel is one with which the settler in this Province need not concern himself.

THE proposition made last season for a telegraph cable to connect the Manitou islands, in Lake Michigan with the mainland, so that news from distressed vessels, and other marine news can be sent to interested parties at ports of departure, and elsewhere, is about to be realized.

WOOD-WORKING PATENTS.

The following list of patents relating to the wood-working interests, granted by the United States Patent Office, May 11th, 1886, is specially reported by Franklyn H. Hough, solicitor of American and Foreign patents, 925 F. Street, N. W., Washington, D. C.

341,703—Saw handle—B. H. Ten Eyck, Emporium, Pa.

341,678—Saw mill, circular—J. P. Moore, Snow Hill, Md.

341,789—Saw tooth—E. J. M. Becker, New York, N. Y.

341,667—Sawing stumps, machine for—A. Leitelt, Grand Rapids, Mich.

341,513—Turning wooden bowls, machine for—P. B. Skinner, Wilmington, Indiana.

PATENTS ISSUED MAY 18.

341,951—Log turner—R. W. Shelbourne, Blandville, Ky.

342,235—Plane—A. J. Traut, New Britain, Conn.

341,975—Planing machine—G. F. Wetherill & R. B. Jones, Chicago, Ill.

341,989—Saw, band—E. C. Atkins, Indianapolis, Ind.

342,234—Saw, drag—F. H. Taylor, St. Joseph, Mich.

342,188—Saw swaging machine—M. Covel, Chicago, Ill.

342,172—Saw swaging machine—G. S. Black, Indianapolis, Ind.

342,263—Saw teeth, device for cutting and gumming—A. S. Norwood, West Point, Miss.

342,029—Saw tooth, insertible—F. Miller, Mendinoco, Cal.

342,068—Shingle sawing machine—G. E. Cooke, Clarksville, Tenn.

342,017—Shingles, machine for cutting—A. B. Ireland, Greene, N. Y.

PATENTS ISSUED MAY 25.

342,536—Log handling mechanism—W. J. Perkins, Grand Rapids, Mich.

342,535—Saw—W.J. Perkins, Grand Rapids, Mich.

342,560—Saw frame—A. M. Barber, Bridgeport, Conn.

342,416—Saw mill, band—E. C. Atkins, Indianapolis, Ind.

342,361—Saw mill dog—E. D. Johnson, Milton, Fla.

342,534—Shingle sawing machine—W. J. Perkins, Grand Rapids, Mich.

THE OLD PLAN AND THE NEW.

Mr. Jas. F. Morse, Vice-President of the Security Mutual Benefit Society of New York York, 233 Broadway, has recently placed insurance to the amount of $100,000 on the lives of Ex-Senator Arkell and his son, W. J. Arkell, proprietor of the Albany *Evening Journal* and the *Judge*. This insurance has been placed in the above named and other leading companies doing business on the assessment plan. The annual cost of carrying it will be less than a thousand dollars. In the old life or level premium companies the cost would be four thousand five hundred dollars. The Arkells are among the leading business men of the country, and their endorsement of this method of life insurance will carry weight in the businesss community.

The Security Mutual Benefit Society was organized in 1881, and we learn that the cost for assessments to a member forty years of age has been less than five dollars a year for each thousand dollars of insurance.—*New York Financial Review.*

A good move has been made for the disposal of sawdust by a lumber firm on the Ottawa Messrs. Edwards & Co. They are having a monster furnace erected in which to burn the sawdust and other refuse from their mill. The structure, which is being built of fire brick encased in plate iron, is a circular tower, and when finished will be 140 feet high, and is 36 or 40 feet in diameter.

JAMES WATSON, of Emerson, Man., has been awarded the contract for getting out timber for use in the construction of the Canadian Pacific snow sheds. These sheds are to be constructed in the Selkirk range and the Rockies. They will be some twelve miles in length and will contain 14,000,000 feet of timber.

BOBCAYGEON.

TIMBER DRIVES —No less than three drives of logs in the immediate vicinity of this village on their rapid course down the Gull river waters. They belong to the firms of Dixon & Co., J. E. Gould, and McArthur and Thompson. Mr. Aikins expects a very large drive to issue from Rocky creek upon Gull Lake during this week, and Ullyott & Co. have a large drive gone down ahead. These are all about a month in advance of the progress made last year. Altogether the present spring has been a most beneficial one to both lumbermen and settlers and we trust a rich harvest will ensue.

Moving a Big Tree.

Col. Walter C. Larned, the famous art connoisseur, has been in San Francisco for several weeks on a curious mission. He wishes to transplant to the handsome lawn of his magnificent summer residence at Lake Forest one of the big California trees, and he has just closed a contract with the Wells & Fargo Express company to this effect. Special cars are to be constructed to transport the tree across the plains and the umbrageous leviathan will have to be drawn by horse power after the Missouri river has been reached, because the obstacles in the way of railroad curves and bridges east of that point can not be overcome. The tree which Col. Larned has selected is somewhat over 300 feet in height, is 98 feet in circumference near the base, and weighs about 40,000 tons. The cost of transplanting this monarch of the forest will exceed $18,000.

FOR telegraph poles in England the Norway spruce is employed. Larches of English growth, formerly employed were found sadly wanting in durability. In America, cedar is used where it can be had tall and cheap enough, yet nothing is found better than chestnut, cost and durability both considered. Ten or fifteen years is the average duration of an American telegraph pole. Though the English are talking of iron for telegraph posts, it is a conceded fact that they will cost fourfold those of wood. It will be some time before iron posts are used in a wooden country like the United States.

MESSRS. Rathbun's saw mill at Campbellford, Ont, is fast approaching completion, and very shortly it is expected to be at work. The boilers are being fitted up this week.

THE Eau Claire Lumber Co. is actively preparing to erect a saw mill at Calgary, N. W. T.

A Sure Thing.

There are very few things in this life of which we may be absolutely certain, but this is one of them: that Dr. Pierce's "Pleasant Purgative Pellets" have no equal as a cathartic in derangements of the liver, stomach and bowels. They are very small and their action is pleasant. Purely vegetable, perfectly harmless. 25 cents a vial. All druggists.

PETERBOROUGH WATER CO'Y.

OFFICE, corner of Hunter and Bethune Sts. W. HENDERSON, Superintendent. d71

OVER WORKED Women

For "worn-out," "run-down," debilitated school teachers, milliners, seamstresses, housekeepers, and over-worked women generally, Dr. Pierce's Favorite Prescription is the best of all restorative tonics. It is not a "Cure-all," but admirably fulfills a singleness of purpose, being a most potent Specific for all those Chronic Weaknesses and Diseases peculiar to women. It is a powerful, general as well as uterine, tonic and nervine, and imparts vigor and strength to the whole system. It promptly cures weakness of stomach, indigestion, bloating, weak back, nervous prostration, debility and sleeplessness, in either sex. Favorite Prescription is sold by druggists under our *positive guarantee*. See wrapper around bottle. **Price $1.00, or six bottles for $5.00.** A large treatise on Diseases of Women, profusely illustrated with colored plates and numerous wood-cuts, sent for 10 cents in stamps. Address, WORLD'S DISPENSARY MEDICAL ASSOCIATION, 663 Main Street, Buffalo, N. Y.

SICK HEADACHE, Bilious Headache, and Constipation, promptly cured by Dr. Pierce's Pellets. 25c. a vial, by druggists.

Foot of West 21st Street, New York City.

Hall's VEGETABLE SICILIAN Hair Renewer.

Hall's Hair Renewer restores gray hair to its original color; makes the scalp white and clean; cures dandruff and humors; prevents the hair from falling out, and renders it soft and brilliant. The editor of the "Ocean Foam," Cape May, writes: "We speak knowingly, when we assert that Hall's Vegetable Sicilian Hair Renewer is the best of its kind. The article is an elegant and cleanly one, without which we think no toilet complete." Thos. D. Jones, Middle Granville, N. Y., writes: "I have used

Hall's Hair Renewer about ten years, with satisfactory results." E. G. Perkins, Oberlin, Ohio, writes: "I consider Hall's Hair Renewer the best hair preserver in use. I have used it for the past twenty years, and my hair is in as vigorous and healthy a condition as when I was 30 years of age. Not a sign of gray hair to be seen anywhere.' Dwight L. Chamberlain, Oakland, California, writes: "My hair, which was nearly white, has been restored to its original color and luxuriance by the use of Hall's Hair Renewer."

The advance of time is heralded by bleached, thin, and falling hair. By the use of Hall's Hair Renewer, the hair may be restored to its original color, lustre, and vitality. M. N. Johnson, Fitchburg, Mass., writes: "My hair was weak, thin, and full of dandruff. Hall's Hair Renewer has removed the dandruff, and caused a vigorous growth of new hair." Abel H. Smith, Portsmouth, Va., writes: "My hair had nearly all fallen out, and that which was left was dry and dead. I used one bottle of Hall's Hair

Hall's Hair Renewer,

and now rejoice in the possession of hair as abundant as ever." E. J. Adams, St. Paul, Minn., writes: "A diseased scalp caused my hair to fall out, and, after using a number of preparations without avail, I finally tried Hall's Hair Renewer, which caused a vigorous new growth. I am still using it, and could ask for no better results." Mrs. R. H. Corning, Battle Creek, Mich., writes: "By the use of Hall's Hair Renewer, my head, which was quite bald, has been covered with a fine growth of young hair."

With each order received by us for six boxes, accompanied with five dollars, we will send the purchaser our written guarantee to refund the money if the treatment does no effect a cure. Guarantees issued only by J. D TULLY, Druggist, Sole Agent for Peterboro'

EXPORT DUTY ON SAW LOGS.

The following letter has been published in the Montreal *Gazette*:

SIR,—The unanimity with which an increase of the export duty on saw logs is approved by the press and the people of Canada is most gratifying—the only question in the matter being whether the present is an opportune time for making the increase, now that the Government of the United States is considering the propriety of removing duties from lumber, some fearing that it might be looked upon as an unfriendly act towards the people of the United States. The fact is, no greater mistake can be imagined than this, for the people of the United States, with the single exception of the few lumbermen, are all in favor of free lumber, and would be delighted at any legislation that would tend to make the United States lumbermen let go their grip. The United States lumbermen are looked upon by the people generally as a greedy set of cormorants, who have no thought but their own interests, and who will use any means, however despicable, to carry out their aims.

The New York *Nation*, one of the most respectable papers published in the country, said of them in 1883, on the subject of the tariff on lumber:—

"The duty was placed upon Canadian lumber in the interests of the Northwestern lumbermen. It benefitted no other class, and was desired in no other section. * * * The country is not without words of warning in regard to the dangers which threaten the forests; they have been spoken far and wide. In the meantime we continue to take $2 from the pocket of every man using a thousand feet of pine or spruce lumber, and hand it over to the manufacturers as a bounty to induce them to destroy the forests more rapidly. It is natural then that the manufacturers resist any attempt to have this duty removed. They will make a still more determined fight to prevent it. They are bold, rich and united. They are actuated by a single purpose—to convert the greatest amount of forest into the largest amount of money in the shortest possible time. Their organization is perfect. They control legislatures and elect members of Congress; they own Governors and Senators. They know what they want and they mean to have it at any cost, and without any regard to the future welfare of the country. It will take something stronger than the tariff commission to make them let go their grip upon the people. We repeat, the tariff upon lumber is a premium on the devastation of the country, and should be repealed without delay."

These are the strong words: "They control the legislatures and elect members of Congress; they own Governors and Senators. They know what they want, and they mean to have it at any cost."

We are now regaled with any number of bunkum speeches and resolutions by Senator Frye, of Maine, who is attempting to raise a tempest in a teapot in Washington about the fisheries; and I have no doubt many people think that this doughty Senator is greatly exercised about fish, but it is not free fish but free lumber that is troubling him, and everything is fish that comes to his net, so that he exercising his ingenuity to see how he can kick up a rumpus about fish or anything else to prejudice his people against Canada in order to serve his friends the lumbermen.

Here is what the New York *World* said of this gentleman in 1883, under the heading of the lumber swindle in Congress:

"Mr. Van Wyck, the independent and public spirited Senator from Nebraska, yesterday made an emphatic protest against one particularly outrageous swindle of the tariff. He moved to strike out the whole list of duties on wood and woodenware, and let all these things in duty free. This was a patriotic proposition, and was naturally opposed by * * who represents the men who are anxious to clear out what is left of the forests of Michigan, and Frye, who represents the men who are anxious to clear out what is left of the forests of Maine. These greedy creatures in asking for a duty on lumber or its products, are simply asking for a bounty to be given them for making away with the patri mony of the country," and after showing how rapidly the pine and spruce timber supply was diminishing continues: "How their replacement is to be secured is the problem that ought to agitate statesmen. The problem that does agitate statesmen of the school of * * * and of Frye is how can the rest of the forest be most speedily and effectually cleared, and a bounty for clearing them, in the form of a duty upon the competing product of Canada, is the device formed by these statesmen for that end. * * * * Mr. * * * of Michigan, and Mr. Frye, of Maine, think it better that their lumbering constituents should have large profits and quick returns than that the next generation should have any timber to cut. But there is no reason why other Senators should not deem it more important that the forests should be preserved than that * * * and Frye should continue to adorn the Senate by dint of grinding the axes of their timber cutting constituents."

So we see that Mr. Frye's fishery interest is of a somewhat fishy character. If we wish to assist the people of the United States to have the duties removed from Canadian lumber we must make the United States lumbermen who have timbe properties in Canada alike interested with ourselves in this matter, and even Col. Jeffers, with his 2,000 million feet of Canadian pine, when he finds that he must either saw his logs in Canada and pay $2 per 1,000 United States duty like the rest of us, or contribute largely to the Canadian treasury in case his patriotism is so much superior to self-interest that he will in any event take the logs over and saw them in Michigan, might weaken slightly in his patriotism; for I have always observed that patriotism and $2 per 1,000 on Canadian lumber were strong cards with United States lumbermen. It would be most unjust to suppose that the $2,000,000 advantage Col. Jeffers would enjoy in taking over his two thousand millions of timber to be sawn in Michigan, could have any influence in arousing his patriotism. Put the export duty on saw logs up to $4 per thousand feet, and in less than a week I will warrant you will find governor, colonels and the whole army of Michigan lumbermen who are in Canadian timber lands down at Washington, as active in urging Congress to remove the duties from lumber as they are now persistent in having them retained.

That the fiscal arrangements of Canada had resulted in ruining the saw mill interests of the north shore of Lake Erie was bad enough in itself, but to be laughed at for our folly by those gentlemen who had made their millions out of our timber by towing it over to Buffalo and Tonawanda, N. Y., leaving us the pine stumps alone remaining in evidence of the wealth of timber lost to the country, is by no means a pleasant reflection, but which is fully deserved if we allow this pernicious system to continue any longer.

Congressman lumberman Fisher, of Michigan, speaks right to the point when he says:—"As soon as we attempt anything of that sort (meaning towing over logs to Michigan), up will go the export duty on logs to $3 or $4 a thousand feet. They (the Canadians) would not let us rob them any more than we would not let them rob us." Unfortunately this is exactly what we have been allowing them to do for the past twenty years on Lake Erie, and this they fancy we will continue to do, thinking, no doubt, that we have not spirit enough or intelligence enough to know our own interests.

Since my former communication to the *Gazette* on this subject, members of Parliament have written to me asking that requisitions be sent in, and that they were sure the Government would act at once in this matter in the manner indicated by me, as it was directly in accord with the Government policy, yet it appears to me that the disadvantages under which the Canadian lumberman has to work when competing with the United States lumberman manufacturing Canadian saw logs are so self-evident, that I am sure it is only necessary to call the attention of the Government to the facts to have matters put right.

I am, dear sir,
Your obedient servant,
WILLIAM LITTLE.

Forestry Chambers, Montreal, May 17th.

CHANGES IN THE LUMBER BUSINESS.

As showing the wonderful changes in the lumber business, brought about by improved transportation and the development of new fields of operation, the following points given by the *Manufacturer's Gazette* are interesting and suggestive. One of the largest owners of Aroostook pine timber lands, and also one of the largest manufacturers of that fine grade of soft pine, informs us that the prices of high grade pine lumber are lower to-day than they were thirty-five years ago. This manufacturer runs several mills in St. John, N. B., and commenced his business there in 1851, when Aroostook pine lumber was in great demand, and met with ready sale at $45 for No. 1s and 2s at St. John, $35 for planing 3s, $22 for planing 4s, $16 for shippers, $10 for poor 4s, and $4 per thousand for scoots. Now it is difficult to realize these prices, and the principal grades are offering to-day at $2 to $3 per M less than they sold for in 1851. This is partly due to the fact that the Aroostook lumbermen still get out pine logs of various lengths, while the market here demands the even lengths and even widths which are furnished by the Canadian and Michigan mills. Again the railroad transportation is such that lumber may be frequently shipped from Michigan to interior New England points, or even to Boston, cheaper than it can be shipped from St. John to Boston, the latter by vessel. No doubt if our St. John friends would manufacture their pine of even lengths and even widths, its superior quality would enable them to secure as much or even more than the market affords the Michigan and Canadian lumbermen. The supply available of good pine on the Aroostook is very small compared with what it was years ago, but the market for lumber appears to have run away from it, and there is plenty of pine to be found in other sections to take its place. No pine has ever come to this market which rivalled the Aroostook pine in its soundness and valuable qualities for fine work. In judging of the lumber business one cannot confine his vision to a single state or a single river, but must take the whole continent in view, and bear in mind that the railroads and canals have made wonderful changes in the facility for transporting lumber from one section to another. The lumber famines which are frequently predicted by some of the forestry orators, will hardly come during the present generation. True, some sections are being rapidly depleted of their timber growth, but others are yet undeveloped by reason of the lack of the necessary transportation facilities. The enterprise and push of the lumbermen is constantly reaching out into unexplored territories and utilizing the virgin forests, hitherto a sealed book to the wood-chopper and the lumberman.

CUTTING PRICES.

The ill effects of such a course as cutting prices are attracting attention in the United States. According to the *Bulletin*, "Probably the most prevalent vice in the mercantile world is that of cutting below recognized and established values in order to get ahead of competitors, which is the worst habit that business men can adopt, as it involves a principle which, if persisted in, must result in bankruptcy." The first cut is, frequently, the first logical step to the calling of a meeting of creditors. When a tradesman begins to undersell, he has no idea of overstepping the bounds of moderation; but the great trouble is that moderation in the cutting of prices is the most difficult thing to define. "Commencing by just a shade below regular prices, the cutting propensity grows and grows, until the slightest shade above cost is reached, and in not a few cases bargains have been closed on the hard pan basis of cost itself, while in some instances the pruning process cuts even below it. Now, what is the inevitable result of all this? Why, simply, a resort to the dishonest practice of supplying an inferior article in place of the one sold, in order to make a profit."

If, says the *American Storekeeper*, two or more merchants in the same town, or at competing points, cannot agree like men to stop cutting and to sell staples at a living profit, it will pay any one of them to stop the senseless practice short off, and to step out, alone, if need be, in the path of keeping store for money. No live storekeeper need be forced into "marking down" by the unbusinesslike example of his competitiors. There are other ways of keeping trade. Customers whose patronage is worth having are bright enough to appreciate, when told, that they cannot get something for nothing, and that the merchant who pretends to deal with them on that basis has sinister desires upon their poketbooks. It is better to stop cutting and unprofitable selling by consent and agreement, and an effort to establish such an understanding is advisable, but it is well to stop it anyway.

SUCCESSFUL SALESMAN.

The successful salesman of lumber, or of any other commodity, must have a good many inherent qualities. Primarily he must be a worker. Steadfast industry, even if it results in "main strength and awkwardness," will often accomplish a good deal. He must in some manner bring himself to the point of telling his customer the truth, at least about the article he is selling. If needs be to keep himself at a natural moral level, he can lie about anything else under the sun save the goods he is selling. Deceit in this particular won't do, and it is the very thing that makes more failures among salesmen than anything else. The saleman's ambition should be to secure for himself and the house he represents the esteem and confidence of his trade. This much done his avocation is easy, and his success sure. The weakness of salesmen is to overrate the quality of the goods they are handling, and they thus succeed in disappointing a customer in such a way that it is almost impossible to ever secure another order from him. Meals and bed-time at best are at very irregular hours with the average traveller, but he should make them as regular as possible. "Painting the town red" at night and attempting to do business next day won't do. If a salesman has customers that renders going out and getting drunk a necessity to the continuance of their patronge, it's a line of trade that will hurt his house in the end. It will not only hurt his house but will ruin him, and the sooner he abandons it the better. The successful salesman must be careful of his credits. Don't sell a man a bill of goods if his credit does not appear right. Your opportunity of "sizing up" your customer's business methods and condition is much better than your principal's, and if you exercise discretion in your sales your judgment will be relied on. The salesman, whose house "stands at his back and swears by him" and his transactions is on a much better road to success than the man whose every transaction is scrutinized with distrust, and whose judgment is questioned. Again, if your house allows you some leeway in the matter of prices, don't have your order book filled with prices at the lowest notch at which you can sell. Keep yourself posted on values. And, again, aim at all times to sell, not what your customer may ask you for, but what your house has for sale—keep posted on your stock, and always crowd the "slow sellers" and hang on to the class of goods that sell themselves. For example, any chump can go out on the road and sell a lot of wide, good boards, but it takes a salesman to place cull Norway boards when a man thinks he can use nothing but white pine, or to sell him 14 feet lengths, when he swears he won't buy anything but 16's; or 10 inch stock when he wants 12. But it can be done, and a stock left in a good, unbroken condition all through the year, and a successful salesman can do it.—*Northwestern Lumberman.*

Trade With British Columbia.

The *Herald* of Vancouver, B. C,. the new city on the Pacific coast, in its issue of April 30th says:—

"The works of the Royal City Planing Mill Co. here are progressing rapidly towards completion. The engine and boilers, together with part of the machinery, arrived this week. This was sent from the Hamilton Machine Works, Peterborough, Ontario."

THE mill men of Maine have taken preliminary steps towards forming a state organization.

THE MATTAWA DISTRICT.

The Nipissing *Times*, of North Bay, now turns its attention to the territory embraced in the townships of Mattawa, Olger, Phelps, Mulock and Widdifield, which lie on the north side of the Mattawa river, between the Ottawa river and Lake Nipissing. Mattawa is a very pretty village of nine hundred inhabitants, situated at the junction of the Ottawa and Mattawa rivers. It had its origin in the establishment at this point, of a Hudson Bay Company trading post, and the founding of a mission by the Oblate Fathers among the Indians, before the lumbermen, who were the pioneers of the Upper Ottawa, penetrated the wilderness so far northward. Its growth and commercial importance subsequently arose, however, from the extension of lumber industries in the district of Nipissing. There are here some stores devoted to general or special lines of merchandise and shops devoted to mechanical industries, which will compare favorably with those of the same class in towns of greater pretensions. There are a public and separate school and churches with resident pastors belonging to the Roman Catholic, Anglican, Presbyterian and Methodist persuasions. Moreover, the hotel accommodations here, which are always an object of interest to the traveller, will not be surpassed by any outside of the great cities. There is also a large saw mill, owned by Jas. McCool & Co, situated about a mile above the town, where all kinds of lumber required for building purposes may be obtained. The stranger visiting Mattawa, for the first time, will probably be unfavorably impressed by rough and rocky appearance of its site; but the multitude of boulders which cover the ground is soon lost sight of amid the beauty and sublimity of its surroundings. The lofty mountains whose blue summits mark, in the distance, the bounds on either side of the mighty Ottawa, whose waters rush down from their great northern reservoirs; the huge rocks which project from the mountain's side just opposite the village, eastward, and hang in massive cliffs above the river flowing at its base; the terraced hills, clad in verdure, which rises as they recede westward from the shores of the Mattawa, forming an enchanting background to the church and cemetery which occupy a conspicuous position near the river; the majestic appearance, on the south, of the locomotive leading its long line of cars as it sweeps around the curve with terrific speed, then gradually slackens its pace until it ceases to move at the railway station; and finally, the junction of two great rivers, the commingling of whose many waters in one broad stream presents an emblem of the happy union of different races in the formation of our Canadian nationality, all combine to render Mattawa one of the most attractive villages in the valley of the Ottawa.

Yellow Pine.

Yellow pine, in the form of heavy timbers for large buildings, is making headway in this city. We have previously made mention of the large bill of 1,500,000 feet that Norwood & Butterfield are furnishing for the Marshall Field & Co. warehouse between fifth avenue and Franklin street. Mr. H. F. Seymour states that his house is filling an order for about 100,000 feet of stuff for the Huck Malting Company's new building, corner of Eighteenth and Canal streets. This order is for timbers 12x18, with some much larger than that. Yellow pine has been selected wholly because of its strength. The specifications for the great "Rookery" building, on the site of the old city hall, at first called for maple flooring, but this item has been changed to yellow pine, and bids are out for contract to supply it. It will require 1,000,000 feet to fill the bill.—*Northwestern Lumberman.*

No Right to Make Alaska Lumber.

A despatch from San Francisco on May 7th says:—The revenue cutter Rush sailed last week in search of the schooners Gem and San Buenaventura, bound to this point from Alaska, and known to be loaded with lumber. As the land there is not open to pre-emption, it is unlawful to cut timber upon it. The San Buenaventura, however slipped past the cutter and was nloading on Wednesdy.

The schooner, with her 200,000 feet of pine and cedar, was seized to-day by the United States Marshal. She is the property of the Alaska Trading Company, which owns a mill on the southern extremity of Wrangel Island The technical defence will be that the timber was cut by Indians and simply converted into lumber by the companies who purchased the logs.

WEST'S WORLD'S WONDER OR family liniment has proved to be one of the greatest blessings of the age. It is a never failing remedy for rheumatism, cuts, sprains and bruises. Call on J D. Tully f or a trial bottle and you will use no other

Perhaps the most extraordinary that success has been achieved in modern science has been attained by the Dixon treatment for Catarrh Out of 2,000 patients treated during the past six months, fully ninety per cent. have been cured of this stubborn malady. This is none the less startling when it is remembered that not five per cent. of the patients presenting themselves to the regular practitioner are benefitted, while the patent medicines and other advertised cures never record a cure at all. Starting with the claim now generally believed by the most scientific men that the disease is due to the presence of living parasites in the tissues, Mr. Dixon at once adapted his cure to their extermination; this accomplished the Catarrh is practically cured, and the permanency is unquestioned, as cures effected by him four years ago are cures still. No one else has ever attempted to cure Catarrh in this manner, and no other treatment has ever cured Catarrh. The application of the remedy is simple and can be done at home, and the present season of the year is the most favorable for a speedy and permanent cure, the majority of cases being cured at one treatment. Sufferers should correspond with Messrs. A. H. DIXON & SON, 305 King street west, Toronto, Canada, and enclose a stamp for their treatise on Catarrh.—*Montreal Star* 1y122.

FOR SALE

VALUABLE

Timber Limits

AND

50,000 SAW LOGS

ON SEVERN RIVER

The undersigned being desirous of confining their operations to their Lakefield Mills on the Trent waters, offer for sale the following Limits:—

Township of Hindou, 70 square miles.
" Oakley, 45 " "
" Redout, 22 " "

An area of 137 square miles.

These limits are estimated to contain 180 million feet of Logs, well watered, and afford means of short hauling from all points, and quick and cheap driving to Georgian Bay. Are offered for sale together with plant, depots farms, 1,200 acres deeded lands and 50,000 logs, nearly all of which are on the main river, a large proportion of which are 16 feet long. Apply to

R. & G. Strickland,

3mL LAKEFIELD, ONT.

CRATEFUL—COMFORTING

EPP'S COCOA.

BREAKFAST.

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately flavored beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wher ever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame."—*Civil Service Gazette.*

Made simply with boiling water or milk. Sold packets by Grocers, labelled thus:

All communications, orders and remittances should be addressed and made payable to THE PETERBOROUGH REVIEW PRINTING AND PUBLISHING COMPANY (LIMITED), Peterborough, Ont.

Communications intended for insertion in the CANADA LUMBERMAN, must be accompanied by the name of the writer, not necessarily for publication, but as a guarantee of good faith. Communications to insure insertion (if accepted) in the following number, should be in the hands of the publishers a week before the date of the next issue.

Advertisements intended for insertion in any particular issue should reach the office of publication at least four clear days before the day of publication, to insure insertion.

The CANADA LUMBERMAN is filed at the Offices of MESSRS SAMUEL DEACON & Co., 154 Leadenhall Street, London, England, who also receive advertisements and subscriptions for this paper.

PETERBOROUGH, Ont., JUNE 1st, 1886.

THERE are 5 500 miles of railway in Germany on which metallic sleepers are laid.

FROM fourteen to twenty car loads of square timber passed Mattawa eastward daily last week.

MR. PRENEVEAN'S saw mills in Belmont, Ont., were destroyed by fire last week. The origin of the fire is a mystery. No insurance.

THE steamer Butcher's Boy will run on a line between Ashland, Wis., and Port Arthur, Ont., this seasou.

THE Messrs. Patterson Woodstock, have given an order to J. E. Murphep, of Hepworth Bruce county, for 402,000 feet of lumber to be used in their new buildings.

AN oak was recently cut on J. B. Vandervanter's farm in Gilead, Mich., which measured five feet 10 inches at the base, and was 40 feet to the first limb, where it measured four feet.

THE tannery owned by Geo. Hollinge at Hanover, Ont., was totally destroyed by fire on May 20th. Insured for $2300 ; loss not nearly covered by insurance.

GILMOUR & Co's drive of logs in Squaw river have grounded, on account of the floods washing out dams and allowing the water to escape. The logs will have to remain where they are until next spring.

It is circulating in Michigan papers that a syndicate is being formed in Saginaw valley, with a capital of $1,500.000, for the purchase of $600,000,000 feet of standing timber on Columbia river, Oregon or Washington, or both.

THE first raft of the season, consisting of som cribs of oak, ash and pine belonging to Messrs. McConnell & Klock, has arrived in the canal basin at Ottawa from up the Rideau. It comprises, says the Citizen, some remarkably good oak.

IT is stated that the Siam Forest Company has been formed in Bombay, India, to work a large forest concession which has been granted to it by the king of Siam. The concession is of forests covering an area of over 2,000 square miles, and said to contain much fine oak timber.

A cargo of hardwsods from the Philipine Islands has been shipped to England, about two thirds of it being cedar. In connection with the above, when we read of regular arrivals at Melbourne, Australia, of lumber from the Baltic sea, the world-wide and complicated character of the lumber trade is faintly appreciated.

A despatch from Quebec says:—Mr. William Dobie, a youngman in a lower town mercantile establishment, who arrived out from Edinburgh about two years ago, has recently fallen heir to over £380 000 by the death of his father in England. He intends returning to the old country to live, taking with him as a bride one of Quebec's charming daughters, Miss Eva Wilson, daughter of C. W. Wilson, the well known lumber merchant.

THE NORWOOD STEAM WORKS.

But too little notice, it is to be regretted, has been taken of some of the leading industries of the village of Norwood. In fact, it may be said of the enterprise now under notice, one of the most important industries in the county of Peterborough not on account of the wages disbursed in the factory, but on account of the useful and valuable material the product of the Finlay Works; or, as they are appropriately called, the "Norwood Steam Bending and Hub and Spoke Factory," owned and managed by Finlay & Son, the elder member of the firm being a man of great business capacity, energy and stability, qualities which have enabled him to battle successfully with many trying commercial storms. Energy and enterprise stimulated by sound judgment and keenness of observation, generally leads to success, and such in a word, has been the career of Mr. John Finlay, though meeting with not a few discouraging obstacles.

The business of this factory, under the fostering care and push and pluck of the proprietors, has increased to immense proportions. A visit to the works recently, by the writer, found the large building, occupying extensive grounds, fairly alive with the hum of rapidly revolving machinery, and it was with pleasure and interest we observed the rough material passing from one piece of machinery to another till finally it came forth a useful and valuable article. Perhaps a brief description of the methods by which hubs are manufactured and the bending process is performed, may be interesting. The timber is brought to the factory during the winter in logs, and first passed over to the sawyers, who with large circular saws propelled by steam, cut them into blocks the different lengths required, these are passed over to a boring machine which bores the heart out of the blocks. The hub rougher comes next into operation, which pares the rough bark apparently with as much ease as one would pare an apple—this part of the machinery, by the way, sprung from the ingenuitive mind of Mr. Finlay himself. The turner now handles the hub, smoothing its surface and giving to it its beautiful rounding, symmetrical form. The mortising machine is now brought into requisition, which neatly and rapidly pierces the required holes for the placing of the spokes. The hub by means of a tramway passes over to another wing of the large factory, where the painters give the finishing touches, and the hubs are now ready for shipment.

In the second story of this establishment are the Bending Works. The timber for this department is also brought from the woods during the winter, and is first cut into planks, then passed to fine or small saws, which rip them into the different sizes required for cutters or sleighs; they are thoroughly planed and then placed in a large steam box, where they remain till they are bent to the required shape ; and now, after going into the factory a huge and unbarked log, are turned over to the spacious packing room a smoothly surfaced and gracefully turned cutter or sleigh runner, and ready for shipment to the numerous patrons of this great factory.

The proprietors have recently added the most approved machinery for the manufacture of the above wares in a very complete manner, and in a style and finish to compete with any factory of the kind in the Dominion. The hands are paid every Saturday regularly, a system which Mr. Finlay has punctually followed for a number of years. The cash paid out thus every week amounts to about $100, but figures for wages are largely increased when stock is being procured for the succeeding season, thus giving employment to as many as 25 or 30 hands, besides many teams of horses, disbursing in this manner, annually, the large sum of $8,000, or perhaps $9,000, not, of course, including in this estimate the large amount of money paid out for logs and other raw material required for the manufacture of hubs, spokes, cutter and sleigh bents, &c.

The Messrs. Finlay certainly deserve their success and prosperity, and the elder Mr. Finlay the personal popularity he has attained in our community. His energy and enterprise has planted in our midst our principal "wage earner," in which considerable capital is invested, and through which a large amount of money is weekly circulated in our village. It is to be hoped that success and prosperity will long attend the works of John Finlay & Son.

HOW A LUMBER KING DIED.

A despatch from Dubois, Pa., to the New York *Sun* says:—The circumstances surrounding the death of John Dubois, the father and patron of this town, were very pathetic, and and have left a deep impression on the community. Although not an infidel, he had lived a careless life. He seldom went to church, preferring to spend Sunday walking about his mills or his fine farm of 1000 acres. For a year or more, however, his mind had been strongly inclined to religious matters. He did not go to the preachers with his perplexities. He read his Bible and consulted with his lawyer about it His lawyer was the Hon. George A. Jenks, who has just resigned the Assistant Secretaryship of the Interior in order to keep a promise to Mr. Dubois that he would take the place of the latter as confidental adviser to a young nephew who gets the vast estate.

A few days before his death Mr. Dubois sent for the Rev. Mr. Bell, and, after a long conversation with him, he was baptized and received into the Presbyterian Church. He immediately sent for the heads of all the departments in his works and as many of the men as could crowd into the sick room, to the number of about fifty. When they were gathered he gave them such an exortation as had never been heard before in all this region. He told them he was dying, and that if he had been well assured of his eternal welfare a week before he would not have been living to talk to them. He could not leave go of life, he said, until he got that question settled, and he urged them not to put it off as he had done. He was willing now to die, but if it was the will of Providence that he lived one year longer, he would not wish to take up his affairs again. He would put in every day, he said, going about the mills telling his men the great truth that he had at length found out and trying to undo some of the evil his example had wrought in his long lifetime.

His voice and brain were strong, although his body was wasted almost to a skeleton and he could scarcely sit up in bed propped with pillows. The men had worked for him—some ten some twenty, some thirty years. They were rough, grizzly fellows from the logging camps and the mills, but there was not a dry cheek in the room as he talked to them and called them by name and bid them good-by. Three days afterwards he died. He was buried on his own farm where he lived. He picked out the spot himself. It is on the top of a gentle sloping hill, and overlooks his mills and the town he built. For the three days between his death and his funeral all hands in the town were as idle as his own. Not a wheel turned in any of the mills. Nobody did any business in the stores. Three thousand people looked at him in his coffin and walked behind it to the grave.

Although his works were divided up into different departments, each under its responsible head, he knew all of the 800 men who worked for him, and always spoke to them as courteously as if they were all millionaries as well as himself. Some years ago, when times were hard and lumber fell at a low figure, the managers of the works agreed that there must be a reduction in the wages of the men, and so told him. He heard them through and took the figures they had brought him, but made no decision. The next day he summoned them to meet him again, and said :

"This will not do. I have examined the books at the store, and find that it takes about all these men earn to buy necessaries for themselves and their famalies. If we must reduce wages I will begin with you, who are better paid. Say no more about it ; I guess I can stand a loss better than the men can a reduction."

EXPORT DUTY ON LOGS.

WE would again call attention to the subject of the export duty on saw logs, for it is a matter that should not be allowed to sink into oblivion and neglect. It is obvious that the duty on export logs should be raised to $2 so as to counterbalance the United States import duty on lumber. Till this change is made the very least that should be done is to enforce the payment of the present export duty of $1. It absurd to suppose that this cannot done. There are regulations for shipping, there are ways of dealing with sumgglers that can be made effective, whether the offenders fly the Canadian or the United States flag. Saw logs cannot be smuggled like jewels or lace, and both they and the vessels concerned would be liable to seizure. The great risk of such a serious loss would check attempts to evade the law if its stringent enforcement were practiced.

The cost of collecting the duty, though it has been alleged as an obstacle, is not really a serious objection, for it would be recouped over and over again by the amount collected. But even if there were more than the amount of revenue spent in collecting it, the argument against enforcement would not be conclusive. Under such circumstances it would still be alike just and politic to protect our lumbermen from unfair competition, and our forests from devastation in order to enrich foreign millowners.

This is matter which is becoming more and more urgent. Lumbermen from the United States have of late purchased a great extent of timber limit from the Ontario Government and others. The purchasers make no secret of their intention to convey these Canadian saw logs across the lakes to supply saw mills in the United States. Inadequate as is the present duty it should certainly be collected, and as soon as possible it should be doubled. The evil has already become of some magnitude and it is certain to be greatly increased ere long if proper precautions are not taken.

Since writing the above we are glad to learn that the export duties have been increased as follows :—Single bolts $1.50 per cord, spruce logs $2 per thousand, pine logs $3 per thousand. This satisfactory as to the duties, and now it only remains to see that they are enforced.

BURNING SAWDUST.

Thos. Price writes as follows to the *Machinist* concerning wet sawdust, etc. : "I had a little experience in sooty flues and smoke-box from wet sawdust and bark, and used to have a burn-out often at noon when the fire was low. I have eight boilers, 48 inches diameter by 16 feet long, and at first built them with grates, eight feet long, thinking that the larger the grate area, the better the combustion. But I could not keep steam to run half what I drive now, and had to find a remedy. The draft was too sluggish. I could not change my smokestack, so I thought I would try less grate area. I simply laid fire-brick across the back end of the grate-bars, and raised the bridge wall within eight inches of the boilers I made double the steam I could before, and the tubes and smoke boxes and breeching were free from soot, and have never burnt out since.

THE LUMBER EXPORT DUTY.

Mr. Perley, of the extensive lumbering firm of Perley & Pattee, on being asked by a *Journal* reporter to-day his opinion in regard to the new export duty on logs, stated that although it did not effect the lumbermen about Ottawa, it was a good and just thing for Canada at large, as it enabled the Western Ontario lumbermen to preserve their lumber resources, and not have them swallowed up by American capitalists. The latter come over, and in the district surrounding Georgian Bay and Lake Superior, get out an immense quantity of logs and send them over to their mills on the American side free of duty. In this manner the fine lumber resources of Georgian Bay and Lake Superior are being drained of their best timber by these American capitalists. Mr. Perley also thought that the measure would have its desired effect in causing the Americans to remove the duty on manufactured lumber.

Mr. Bronson, of Bronson and Weston was called on, but was not to be found. The manager of the firm said that the measure was a decided boon to the Western Ontario lumber merchants. He also thought that the measure would compel the Americans to remove the duty on manufactured lumber, as the present duty on Canadian logs would affect to a great extent the American lumber merchants on the shore of Lake Superior.

Mr. E. B. Eddy on being called upon stated that the measure was a good one.—*Ottawa Journal.*

DOWN A FLUME.

A Chicago newspaper man tells in the *Herald* of that city an experience he once had riding in a Nevada lumber flume. "Lumber flumes in the Sierra Nevades," he said, "are all the way from five to forty miles long. They are built on a regular engineer grade. The bed of the flume is made of two-inch plank in the form of a V, the sides of the V being from eighteen to twenty six inches high. They are built on a grade of about sixteen feet drop to the thousand. They carry eight inches of water in the acute angle, and discharge it at the rate of 400 miner's inches a minute. In other words, turn in your water at the head of the flume, and it will carry a log weighing 400 pounds with a velocity greater than the fastest engine that was ever made. The log's displacement just about fills the V without any more friction than necessary to keep it in place.

"About nine years ago I was up at Lake Tanoe with E. W. Smalley and W. H. Patton of the Mackey & Fair Lumber Company. Patton was showing us the sights. We had come up from Carson City, sixteen miles, by stage, and it was a hot and tedious ride. About sundown Patton said: "Boys, we'll go home by the flume, and we'll get there a little quicker I think."

"He directed a man to bring out the yacht, as he called it. This was a V shaped canoe about 14 feet long, very shallow, and made to fit the flume and just about fill it with the displacement of 600 pounds. The yacht had a brake—two rubber pads on either side, worked with a lever, and so applied against the V flume that on pressure it would lift the yacht gradually and allow the lightning current to pass under her. She also had two small rubber wheels, one on either bow, to keep her nose from grinding on the sides of the flume as she went by curves.

"Now boys," said Mr. Patton, "button up your coats, tie down your hats and hold on. Don't get scared. Trust your lives to me for the next half hour. I've sailed in this yacht before, and I know she's staunch."

"There were three seats. Patton took the front one to handle the break. Smalley took the next one and I took the rear and worked the tiller. That was rigged just like a ship's rudder, with a rubber wheel to ease of her stern against the side of the flume if she got to yawing. Patton told his men to put on two inches more of water, and then, with a wave of his hat we weighed anchor. Great Scott! how that thing jumped! Smalley got seasick. I jammed my helm hard down, but Patton yelled through the air, "Let her go; I've got her!" And with one hand on his brake, his hat crushed down on his head, and his teeth set, he looked the incarnation of courage. We plunged down the mountain with a speed that no steam could give. Trees flew like spectres. Looking ahead down the narrow thread-like flume it seemed like a plunge to destruction. Several times the flume carried us over a high trestle. It seemed like leaping over a precipice. Smalley held his breath, but the little yacht jumped it through the air apparently with a swish. Curves would show themselves ahead. The rudder wheel would squeak on either side, and the good ship would round that curve with a flash. Sometimes an unevenness in the flume would occur, and then, as the craft sped over it, the spray would rise 50 feet in the air.

"Keep on your hats!" shouted Patton, then, as we struck a straight five-mile stretch, "now hold on to your teeth."

"I don't exactly know what the next sensation was, but I tried to peep out from the rim of my hat, and my soul, it was all a blur—trees, rocks, landscapes, were all mingled in an indistinguishable mass. It was as if one was blown through the air from a catapult.

"Well, from the time we weighed anchor up at Lake Tahoe until Patton put on his brakes just outside the lumber field at Carson City it seemed like a minute or two. We all looked at our watches. We had made just 16 miles in eight minutes and forty seconds. I never in all my life had such an illustration of the force of water."

ITEMS FROM THE EAST.

Among lumber items from the Maritime Provinces, says an exchange, we observe the statement that the snow was all out of the New Brunswick woods on May 12th, and without heavy rains it is likely that large quantities of logs will be hung up till next season. In the river St. John the water fell rapidly last week. On Monday, 17th, all the logs were out of the tributaries of Grand Lake. The lumber running into the booms at present is principally Aroostook; little or none is coming over Grand Falls from the upper St. John at present. All the Tobique lumber drives are now out except those belonging to Babbitt & McNair. It is stated by the Sun that little or no driving has been done by Alex. Gibson on the Nashwaak this season. At last accounts (15th) the lumber in Salmon river and its branches was nearly all out. Much of the lumber on the Washademoak, however, is hung up, and there are few prospects of its being brought to market this season. A Parrsboro telegram of May 14th says that Young's lumber drive was in and sawing was begun, and that deals were pouring into the port. We learn from the Amherst Gazette that 18 ships are now on the way to Northport, and Mr. Hickman has 6,600,000 superficial feet of deals ready to load them. The vessels are chartered for west coast of Ireland and Liverpool at £2 3s. to £2 5s. Twelve more vessels are to be loaded during the summer, on that shore, making his shipments for the season eleven millions—an increase of one-third over last season's operations.

FENELON FALLS.

SAWLOG DRIVES.—Last Monday the first of this season's drives of sawlogs passed over the slide. There were about 40,000, all belonging to Boyd & Co., who have at least 100,000 altogether, and Mr. Hilliard has about 16,000. Some are across the lake and some near the pulp mill and for several weeks to come, the river below the falls will be so full of them that boats can not get either up or down. There are a few big ones among them, but the average is much smaller than it was ten or a dozen years ago. —Gazette.

The Civil Service Reformers

say their object is simply to retain good men in office when you find them. This theory may be safely applied to the treatment of the human system by means of medicine. Those who have once tried Dr. Pierce's "Golden Medical Discovery" for scrofulous swellings and sores, loss of flesh and appetite, weak lungs, spitting of blood and consumption, will apply to it the real principle of Civil Service Reform and "hold fast to that which is good."

Argument in the celebrated Toronto appeal case of Dumoulin v. Langtry was concluded on Friday before the Supreme Court, judgment being reserved.

THE

SECURITY

MUTUAL

Benefit Society

OF NEW YORK,

No. 233 Broadway, New York.

The Security Mutual Benefit Society of New York is one of the few assessment life insurance companies that has attained conspicuous success. "Slow and Sure" has been the motto of its managers, and they have preferred to build up a solid foundation with

Strictly Frst-Class Male Risks,

rather than grow fast numerically at the expense of safety and become burdened with unsafe risks, heavy mortality and frequent assessments.

The members of this society elect their own officers annually, cannot be assessed except for death losses occurring after the surplus fund is exhausted, are guaranteed against dishonest management by the Agency Security and Guaranty Company, a responsible corporation organized upon the unlimited plan, and having one hundred thousand dollars capital, and who also

GUARANTEE THE PERPETUITY OF THE SOCIETY FOR 48 YEARS.

Considering the elements of safety and permanency which it affords, no organization ever before offered the substantial benefits of life insurance at so little cost to the insured.

ONLY TWELVE ASSESSMENTS

have been levied from 1881 to 1886, averaging three a year, and making the cost for assessments to a man of 40 years

Less Than Five Dollars a Year

for each $1,000 of insurance.

T. MILBURN & CO., Proprietors, Toronto.

THE POSITION OF SPRUCE MANUFACTURERS.

There are several reasons why the spruce business in the east has failed to realize that measure of success which was so fondly hoped for, and so reasonably anticipated, early in the year. The prime cause must be attributed to the labor troubles; but aside from that there has been a noticeable lack of unanimity among the manufacturers. The *Lumberman* in previous comments upon the subject, has endeavored to take into consideration all the factors necessary to bring about the most satisfactory results. A careful comparison of stocks on hand and supplies at the mills, together with a fair estimate of the demand, both actual and prospective, led to the belief that the time had arrived for the manufacturers of spruce lumber to take a stand that would place them in a position to at least share, if not wholly dictate, the distribution and value of such stock in the eastern markets. Our position was based on the g ound that for the last three years the selling price of spruce in the New England and New York markets had been less than the real value of the wood, and that the net results were inadequate to insure a reasonable profit to the operators. We still cling to that belief, and although there are existing circumstances which necessarily curtail dist ibution, we fail to see wherein the manufacturers are any worse off than others in the same line, in different sections of the country. It is an ill-advised policy to pursue the tactics of certain large manufacturers at the present time, who, from lack of foresight, attempt to force supplies upon the market, when the local conditions are such that an overstock will break the price. It is not probable that the disturbance which now threatens the building trade in that section will last long, and when the matter is settled the demand will doubtless again rise to its just proportions, and sales will be made in sufficient amounts to offset the present lack of demand.

Mill men should not ship spruce to the leading market s at present, except on actual orders, and should not accept cut prices under any consideration, for many of the larger yards in Boston and New York are actually destitute of certain sizes, and must replenish. A concession in prices at this time means cut prices all summer, and possibly a worse form of demoralization than has been undergone during the last few years. Spruce manufacturers should stand firm and not dispose of their output through fear, or a misunderstanding of the real situation.

It must be remember that the yard dealers all through the east handle spruce dimension stock for the sake of securing orders for other lumber on which a good profit can be secured, and consequently it can make but little difference to them whether the market price is $13.50 a thousand or less; but it does make a difference to the mill men.

From present reports it is indicated that there will be snfficient demand to require all the spruce that will be cut this season, and consequently another reason is added to the list why manufacturers should stand shoulder to shoulder and exercise good judgment in accepting orders both in quantity and price. A false step taken at this time is absolutely certain to ruin the wholesale trade for the year, and as all the circumstances point to the folly of such a course, mill men should "make haste slowly," and not become their own financial executioners.—*Northwestern Lumberman.*

FROZEN TIMBER.

A correspondent of the *Northwestern Lumberman* writes:—It was refreshing to recognize an old acquaintance in the statement of a "well informed lumberman" that frozen lumber occu pies less space than when well aired or kiln dried. If age is a test of truth, this fable must be true, as I heard the same statement more than fifty years ago. I think the man that laid the frozen fl or boards must have been a brother of the man who, to prove that old growth red oak never could be seasoned, said that his grandfather had a red oak mantle that was in for 75 years, and that when the house was torn down and mantle cut up and burned the sap ran out as it was burning; but seriously, is it possible that men can believe such fables? They are so contrary to nature that it is difficult to believe that men who have come in direct contact with nature can take stock in them. There is nothing in the wood but the sap (which is water) that can freeze. Water always expands in freezing. This can be easily proved by placing it in a broken vessel If water contracted when freezing, it would sink to the bottom of the rivers and ponds, instead of re aining at the top. The heart of white pine never freezes unless it is shaky. Years ago I had an argument with a sawyer who was sawing frozen timber, on this very point, and, to convince him, sawed out a piece of pine exactly two feet long, nine inches wide and seven-eigths of an inch thick. This was in February, and the following July the board was removed from its resting place over the stove pipe and measured, and it was found to measure two feet in length, 8 13-16 inches in width and 13-16 inches in thickness. In other words it had not shrunk any in length, but had shrunk two per cent. in thickness. The difference in contraction was on account of the piece being cut slashways.

THE KOOTENAY COUNTRY.

The Columbia river and Kootenay Railway Company intend to build this season a railway twenty-five miles long, extending from the mouth of Kootenay river, on the Columbia to Kootenay lake. It was originally intended to be a narrow gauge. It is intended to tap the rich mining region of Kootenay lake, which is accessible, except from Sand Point, on the Northern Pacific. In connection with the railroad the company will build steamers to run from their western terminus up the Columbia river to Farwell— the west crossing of the Columbia by the Canadian Pacific Railway—and also steamers to run on Kootenay lake to the boundary line between British Columbia and the United States. The company has a grant of seven hundred and fifty thousand acres of land from the British Columbia Government. Of this it has already taken up 50,000 acres in the rich mineral belt on Kootenay lake. The remaining seven hundred thousand acres will be settled along both banks of the Columbia river, from the boundary line to the head of navigation on the stream. A reserve of six miles wide on each side of the Columbia has been made by the Government to continue till the end of 1888, during which time the company must make its selection of lands. The mining region of Kootenay Lake district consists of an argentiferous belt of galena ore, several miles in width. In this belt exists the most extensive deposits of lead ore probably in the world. The assays of the various veins of ore vary from $15 to $175 worth of silver per ton. The facilities for smelting are very great. Iron ore and limestone exist in the immediate vicinity, both being needed for a flux in smelting. A clay capable of producing fire brick is also found on the borders of the lake. Charcoal can be obtained from the forests which surround the lake. It is the opinion of good judges that within a few years the Kootenay district will be the largest base metal producing district no the Pacific coast, and that hundreds of tons of pig lead will be shipped daily from that region. Northerly from the immediate vicinity of the ead mines, along the rivers emptying into the Kootenay lake, placer gold diggings were found during the season of 1885, and a railway is now pr jected from the town of Farwell to the head of Upper Arrow Lake, thence across a low divide to Kootenay Lake mines. South of the boundary line, in the Colville district, rich silver and lead mines have been opened during the past season and it is probable that the belt will be found continuous throughout Idaho and Montana North of the town of Farwell, in the Big Bend region of the Columbia, some very rich gold bearing quartz veins have been discovered, which will attract a great many miners and capitalists during the coming season. Steamboats will be put on the Columbia river, from Farwell upwards, to supply this district. This mining region will supply a large body of the traffic to the Canadian Pacific, as the lead of Kootenay, in pigs, will be shipped over the road to Montreal en route to Swansea.—*Inland Sentinel, Kamloops*

THE COFFIN-MAKING INDUSTRY.

There are 34 coffin factories in the United States, an exchange says, and they turn out an average of 150 coffins and caskets a day. The largest factory is in Cincinnati; it covers acres of ground and its shop facilities are so great that it manufactures everything necessary to complete a funeral, except corpses. Anything from a tack up to a hearse can be seen in process of manufacture on their premises. Next to Cincinnati, Chicago has the largest coffin factories. The biggest coffin kept in stock by one Chicago house is 6 ft. 9 inches in length and has an opening of 28 or 29 inches. The average is 18 or 19 inches, and the average long coffin is 6 feet 4 inches. The longest coffin turned out by any factory is a 9 footer, in which the dignitaries of the Catholic church are buried. Such a coffin was used at the burial of Cardinal McCloskey, the extra length being required for his crown which he wore in death. About 24 hours were taken to put this coffin together, but an ordinary coffin, that is, a coffin of extra large size, no matter what its cost or the character of the trimmings or upholestry, can be put together from the rough boards in three hours at the utmost

ARBOR DAY IN QUEBEC.

Arbor Day was generally observed as a holiday in Quebec, the principal event being the planting of a large number of trees in Covefield The Lieut.-Governor, the Speakers and members of both Houses of Parliament, Mayor Langelier and the members of the City Council, with many private citizens were in attendance. The proceedings were opened by the Hon. Mr. Lynch, Commissioner of Crown Lands, who alluded to the happy suggestion of Hon. Mr. Joly, which was the cause of the first celebration and its successful results as shown in the interest exhibited in to-day's proceedings. The first tree was planted by His Honor Lieutenant-Governor Masson, and then the workmen present set to work, under the supervision of Mr. Lesage and Mr. Gauvreau, of the Public Works Department, in planting the trees provided. After the Cabinet Ministers and their wives had each done their duty in the premises, the Lieutenant-Governor addressed those present paying at the outset a merited eulogium to Hon. Mr Joly. The proceedings were closed with cheers for the Queen and the Lieutenant-Governor.

THE LAST HEMLOCK TREE.

A Honesdale, Pa., despatch says:—The last merchantable tree in the vast hemlock forests that have supplied the mills on the Dyberry Creek, one of the tributaries of the Laxawaxen River, for more than a quarter of a century, has been cut, and on Saturday the veteran river pilot, "Bill" Kimble, drove the last log down the stream that will ever be run to the mills. He also drove the first log that was cut in the great forest, in 1860, and has never missed a day's log driving on the creek in all the intervening time. This tract of hemlock was nearly the last of any extent in Wayne county, whose forests ten years ago were yielding 100,000,000 feet of that lumber a year. Fifteen years ago more leather was tanned in Wayne county than in any other county in the Union. The disappearance of the hemlock has caused all but two or three of the tanneries to be abandoned. All who were engaged the business made large fortunes, and nearly all of them are now engaged in the same business in Elk, Forest, Warren and other western counties, where the greatest hemlock forests in world still densely cover the hills. The tanning industry of those counties now supplies almost the entire sole-leather product of the world. The cutting away of the hemlock woods in Wayne county has had a disastrous effect on the water courses, many lage streams having become almost entirely dry within the past decade.

THE NEW RAFTING IDEA.

The New York correspondent of the *Northwestern Lumberman* says:—Another trial is to be made in the matter of rafting logs on the ocean. H. R Robertson some time ago secured letters patent for his invention from the United States Commissioner of patents for 17 years, and also in Canada, Norway and other countries. It is not a series of rafts, but all in one, somewhat in the shape of a cigar, with a chain through the centre and at distances around it, about seven feet apart. It can be built any length, and the arrangement of the chains is such that the traction in towing seems to tighten. One has been building at Two Rivers, Nova Scotia, since April 1st, by B. B. Barnhill, under the direction of the patentee. It is, I believe, about 400 feet long. The centre chain was put in place the last of April, and it is now nearing completion, and will be lauched early in June, and towed to this city, arriving about the last of the month. It is built on a "way," after the fashion of a ship and launched in the same manner. It is possible that the construction could take place in the water where the tide was not so great; where it is building the tide rises over 40 feet.

This raft will contain from 2,500,000 to 3,000,000 feet of saw logs, piling and spars. The cost of towing will be about one-quarter of the freight charge if shipped on vessels. The raft is satisfactory to underwriters and can be insured at low rates. The Captain of the tug which will tow the novel thing says he could take it across the ocean. It is said that a Cincinnati firm has offered a tempting sum for the right to build a similar raft in British Columbia. If the thing proves a success, as it now promises, we may see rafts of redwood and cedar from the Pacific coast towed into this harbor. What a handy thing the ship canal across the isthmus will be!

TILBURY DOCKS.

The opening of spacious docks at Tilbury, Eng., at the mouth of the river Thames, shows that London has outgrown the waterway of the Thames. Mariners have become impatient of tides which served a less expeditious age. The Thames is overcrowded with shipping, and the steamers of to-day are too gigantic to make a safe passage up the river. The great harbor which has been provided at Tilbury, at a cost of fifteen million dollars, must be pronounced a triumph of engineering skill. The new docks occupy what, until their construction was little more than a marshy waste, whatever the locality may have been when, at the time of the Spanish armada, a camp was formed at Tilbury through which Queen Elizabeth rode on horseback to inspire her troops. Four years have elapsed since the first turf was cut, and the average number of men employed on the works has been 4,500. The docks covered three hundred acres, have three miles of stone quays, and consists of a main basin and four dry dock. Thirty-one of the largest vessels in the world can be loaded at one and the same time to their full draught along the quay. A depth of 45 feet at high water will permit steamers to pass straight into the docks on their arrival from distant shores. An enormous saving of time and money will thus be effected by big steamers being docked and their cargoes transhipped at Tilbury instead of having to wait as heretofore for the tides to enable them to reach the port of London proper. Trains will run to Fenchurch street in thirty-five minutes, so that ocean voyagers, in less than an hour after arriving off Gravesend, may find themselves with their luggage in the heart of London. For the convenience of passengers on arrival or departure, a spacious hotel has been erected near the river bank. Every provision is made for the expeditious loading and unloading of cargoes. Sixty movable hydraulic cranes have been constructed, each capable of lifting a ton and a half, in addition to a powerful floating steam crane designed to swing fifty tons. The electric light has been fitted throughout the entire dock system and hotel, eight arc lamps of 3,000 candle power having been fixed on masts, together with 1,000 glow lamps, which will render shipowners independent of day light when a cargo has to be taken in or discharged. The emptying of the dry docks by pumping out 12,000,000 gallons of water, will be performed in an hour, so that vessels, without delay, can undergo necessary repairs.

Chips.

THE water on the rivers and lakes fell more rapidly this spring than has been known for years past.

FOUR hundred species of trees are found in North America. Of these sixteen are heavy enough to sink in water when dry.

THE Grand Trunk railway is to erect a new station in Montreal, this season, to cost from $300,000 to $400.000.

A BOOM of logs to be used in making a steamer landing at the Old Man's Island, near Brockville, broke away Saturday night and was lost.

JOHN KENNEDY, who has charge of Burton Bros., Powers' and Maxwells' drives, is running upwards of 65,000 pieces. They have passed over the dam at Burk's Falls.

THE men unloading the lumber on barges at Kingston were receiving fifteen cents per hour. They struck for twenty cents and their demand was acceded to.

A NUMBER of forest fires in Burlington and Atlantic counties, New Jersey, burned buildings valued at $4,700, and swept through a cedar swamp, destroying much valuable timber.

THE new band saw in the Chippewa Lumber and Boom Company's mill, at Chippewa Falls, Wis., gives the best of satisfaction. It cuts between 25,000 and 30,000 feet a day.

THE schooner Oregon, with lumber from the Kennebec for New York, arrived at Gloucester, Mass., May 9th, leaking badly. In a storm the night before a deck load was lost.

CANTIN'S ship carpenters in Montreal struck work on Monday for an advance of wages from $1.50 to $1.75. Mr. Cantin agreed to pay his men $1.75 for the future.

THE Conger Lumber Company's steam mil at Parry Sound was started up on May 11th and is being run up to its full capacity. The company expect to do a big season's cutting this season.

THE cut of logs on Androscoggin waters the past winter is something above 60,000,000 ft. Of this amount about 50,000,000 feet, in the opinion of the *Post*, will probably reach market the present season.

MICHIGAN dealers are buying black walnut fence rails in that state, that have been used twenty years. The thoroughly seasoned wood is used for chair legs, spindles and other small articles.

IT is estimated that on the 3,269,439 acres of uncleared land, tributary to White river, Arkansas, there are 34 814,333,000 feet of hardwood fit for lumber and timber. It is a wonder that the odd inches were not included in the estimate.

AT Beaver Falls, Pa., a co-operative planing mill company has been formed among a number of practical mechanics, with a capital of $50,000. They have purchased the planing mill of Wareham, Dodds & Co., and propose to fit up with the most approved and costly wood-working machinery.

A TOW of four Canadian vessels recently loaded square timber at Marquette, Mich., for Burton & Nelson. It goes to Garden Island, in St. Lawrence river, where it will be put into rafts and floated to Quebec. The amount of timber Burton & Nelson have at Marquette will load the same tow four trips.

A TOW of Canadian vessels lately arrived at Tonawanda, N. Y., to load cargoes to be taken through the Welland canal for Quebec, and thence to South America. The lumber thus to be shipped belongs to the Export Lumbe Company, and goes to its trade in Buenos Ayres.

BARNET and Mackey's square timber cut on the Sturgeon river has all passed Sturgeon Falls en route to Cache bay from which point it will be shipped by the C. P. R. to Papineauville. The C. P. R. Co are building a spur a mile long, striking the river above the falls, where D and E. D. Moore will boom and load their square timber. The iron will be all laid in a few days.

THE soundness of timber may be ascertained by placing the ear close to one end of the log, while another person delivers a succession of smart blows with a hammer or mallet on the opposite end, when a continuance of the vibrations will indicate to an experienced ear even the degree of soundness. If only a dull thud meets the ear, the listener may be certain that unsoundness exists.

THE increase in strength due to seasoning in different woods is as follows: Elm, 12.3 per cent; oak, 26.6 per cent; ash, 44.7 per cent.; beech, 61.9 per cent. The comparative value of different woods in respect to crushing strength and stiffness is thus shown: Oak 4,074, ash 3,571, elm 3,468, beech 3,079. Regarding relative degree of hardness shell-bark hickory stands the highest and calling that 100, white oak is 85, white ash 77.

THE Parry Sound *Star* of May 14th says:—There is considerable activity around the lumber docks this week. On Saturday evening the Parry Sound Lumber Co.'s barge Van Straubenzie left Sarnia with a full cargo of lumber. On Tuesday the same company's steam barge Lothair and Corisande arrived in port from Oswego having made the run from here to Oswego, discharged their cargo and returned in two weeks. They expect to leave to-day for Oswego, with full cargoes. The same company's schooner Jane C. Woodruff came into port the early part of the week and is now loading lumber for Midland.

BABCOCK & ENGLEMANN are building a logging railroad, ten miles long, in the vicinity of Grayling, Mich. It will be called the Grass Lake & Manistee River railroad Over this railroad it is estimated that 100,000,000 feet of pine will be conveyed and put into Manistee river—pine that is naturally tributary to the Au Sable. When the new road is completed there will be six logging railroads in operation in the vicinity of Grayling, and 65,000,000 feet logs will be by them put into Manistee and Muskegon rivers this season. It is estimated that in Crawford county, with Grayling as the centre, there is 2,200,000,000 feet of standing pine.

A SITE for the Halifax dry dock has been selected. It lies between the sugar refinery and the dock yards, and has a frontage of 808 feet running back to the railway line. The dimensions of the dock will be: length on top 580 feet; length on bottom 560 feet; width on top 162 feet; width on bottom 70 feet. It will built obliquely into the land with the entrance down the harbor and will, says the *Chronicle*, be capable of taking in the largest ships of her majesty's navy, including the great Inflexible of 8,000 tons, thus proving to be, when finished, one of the very largest in the world. Work was commenced last week.

AN English paper states that birch is a good material for doors. A gentleman recently had black birch used for the folding doors of his new house, against the architects protest. The result has so far been satisfactory. The birch in texture resembles satin wood and is a dark cherry in color. The doors are admired by every one that sees them. Although this is so, the question of durability still remains to be tested. Black birch is not generally considered so lasting a wood as some other kinds. There is undoubtedly a great field for furniture and cabinet woods among many of those which are native to our New England soils, and some time the furniture men and architects will wake up to the value and importance.

LUMBER DRIVERS' CALKS

FOR USE IN STREAM DRIVING.

Made from the Best Refined Tool Steel and Forged. The method used in tempering leaves every one of the same temper rendering them stronger and more durable than any other Calks made Samples and prices free on application to the undersigned.

Market Reports.

MONTREAL.

From Our Own Correspondent.

MAY 27.—Activity in the lumber trade has continued here since our last report, and the amount of business done has been very good. Dealers are busy receiving and delivering, and there is every prospect of a good season's business; in fact, if no strikes occur (and so far none have been threatened) the lumber trade will attain to very respectable proportions. It is likely that if the strikes in the United States do not speedily end, many building contracts in New York and Brooklyn will have to be cancelled, and prices in Ottawa will not rule so firm as at present. A large stock of lumber is on hand here, but prices are steady, and the probabilities are that they will be maintained, as dealers have had to pay from five to ten per cent. more for lumber at the mills this year than last. Large quantities are arriving daily per barges from the Ottawa.

Freights to South America ports are quoted at $11 per M. One vessel, the Cambridge, is now loading for Buenos Ayres. Two vessels for the United Kingdom which were chartered in London at 50s. per standard are also loading. Activity in the building line continues.

TORONTO.

From Our Own Correspondent.

MAY 25 —During the past two weeks lumber has moved off quite lively, on the docks as well as from the yards there has been no lack of trade. One tow for Boston, via Ogdensburgh, took away 1,500,000 feet. This was part of a stock bought by a Boston firm from the Ontario Lumber Company, some 3,000,000 feet still, I believe, remaining yet to ship. The price realized for this stock is said to be a good one. Most of the retail yards have lowered their stocks considerably, and purchases from the track side will brisker from now to the end of the season. I find great difficulty in keeping you advised of quotations on lath, and some other kinds of stock, owing to the methods taken by retail men in the matter of sales. more especially is this the case with lath; one dealer will not sell to his customers unless he makes a fair profit, and to do this after piling in his yard he must get $2.20 to $2.25 per M pcs., while others say they never expect to reap any profit from the sale of lath, but keep them solely to accommodate their customers, and so retail them at about $2.10. Owing to the lack of any lumbermen's association there is really no uniformity in prices, each one runs his own gait. One retail firm, not long in the business, in order to work up a trade, is said to have sold on 50 cents per M margin, including teaming, so that if any of your subscribers are disposed to question the schedule of prices given by me, I can only say, as I cannot find any two dealers who quote alike, I give it as nearly to the correct thing as it is possible to get at it, and any dealer who does not realize those figures should do so in order to live by the business.

The mills to the north of us are all in full blast now, and green bill stuff is coming in to fill orders, but is not easy to see how bills can in the future be filled at past prices. The railroad companies are drawing the strings tighter as the weeks pass by, They have now issued a circular calling lumbermen's attention to the fact that after this date, 25 per cent. will be charged on all excess weight over the capacity of the car, that is to say, from all stations where the tariff on lumber is .09 cents per hundred weight will after this date be 11½ cents on all excess weight. This is so manifestly unfair that lumbermen for their own protection must resist it. Let us suppose, for example, that a mill man asks for two cars to be sent for loading, the company sends one the capacity of which is 24 000 pounds, and the other 40,000 pounds, what amount of lumber is he to instruct his men to load on those two cars? If he gets on only 20,000 pounds the company will make him pay for 24,000 pounds, if it turns out that he has loaded on 30,000 pounds on the smaller capacity car, or 40,000 on the larger, the company, forsooth, intend to make him pay 25 per cent. additional on all the excess weight, and yet he has loaded to the best of his judgment about what he thought was right. The company may reply, why let him load so many feet of green lumber and so much of dry? Perhaps the railroad companies will be kind enough to inform lumbermen when lumbar is dry, and when green; there is so much disputing on this point perhaps they might settle it. I must confess my own ignorance on this question. If I take the time that has elapsed since it was cut for a guide I find that in some localities lumber is lighter after having been cut three months, than in other places where it has been cut six months. Doubtless, mill men and lumbermen will be glad to get the company's definition of what really constitutes dry lumber, and in the meantime if those interested do not wage war against this monstrous injustice, lumbermen have not the quantity of grit they are generally credited with possessing. Boycotting might be employed with justice in this case, and while our water routes are open is just the time to bring it into play. What say you lumbermen?

CHICAGO.

BY THE CARGO.

The Northwestern Lumberman May 22nd says:—The resumption of business in the yards is too recent for effect as a stimulant on the cargo market. There has been an increase of inquiry within two or three days, and a few cargoes have been sold. But while affairs in the yards remained unsettled the commission men sent out few vessels, so that it will require a week or ten days to bring a liberal supply to the market, even if commission men determine to order the lumber forward at once, which is not at all likely, as the majority of them think that it will be some time before the market will bear much of a load. It is evident that the policy pursued last year of bringing forward supplies cautiously is to be the rule this year. The day for crowding lumber on the market to be slaughtered seems to have passed. The bulk of the lumber destined for this market is now held in strong hands, that are growing stronger every year. Hence prices are likely to be steadier hereafter than in former years.

The piece stuff that has been sold this week has mostly gone for $9 25 a thousand for short green and $10 50 to $11 for dry white pine, some dry Norway having been sold for $10. Long stuff sells for higher prices, ranging from $11 to $13. No. 2 boards and strips range from $11 to $12. As yet there has been too little of this class of stuff on the market to establish prices.

The shingle market has been druggy until within a day or two; now there is a little more inquiry, but prices are indifinite; in fact, neither sellers or buyers have much to say about shingles. Sales of extra brands have lately been made at $2 05 a thousand. Mill men this spring tried their usual scheme of sending forward a lot of inferior cedar shingles, and thus degraded the market value of all cedar stock. Good shingles only of this kind are wanted in this market. The reputation of cedar shingles here and in the tributary territory around, is yet in a measure on trial, and nothing but a good article should be forced on the market. Manufacturers were, perhaps, encouraged by the headway that cedars made last year, and on that basis have ventured too far with poor qualities this spring.

AT THE YARDS.

Last week Thursday it was known that the yard lockout strike was virtually over, and on Friday there was a considerable rush of the old hands for re-instatement in their former positions. There were already a number of new men at work in the majority of yards, and this, coupled with the falling off in business since the trouble began rendered it unnecessary to employ as many men as formerly. On Saturday each yard had as many men as could be worked, and hundreds were turned away.

By the monthly statement of the secretary of the exchange it appears that the stock on hand in the yards of this city May 1st, was 312,715,417 feet, as compared to 396,147,654 feet on April 1st, a decrease of 83,952,237 feet for the month. As compared with the amount on hand May 1st, 1885, there was on May 1st, this year, a decrease of 22,314,252 feet. Shingles increased during April to the amount of 35,276,370, and during the year 169,231,100.

Receipts of lumber and shingles for the week ending May 19th, as reported by the Lumberman's Exchange:—

RECEIPTS.

	Lumber.	*Shingles.*
1886	26,057,000	15,693,000
1885	61,713,000	16,729,000

FROM JAN. 1, TO MAY 19, INCLUSIVE.

RECEIPTS.

LONDON.

The Timber Trades Journal of May 15th says:—The great wave of depression now rolling over the country, and which threatens to make 1886 memorable in the commercial history of the United Kingdom, is becoming more appreciable every day. There are so many causes operating to foster the slackening of our industries that we suppose we must be thankful that matters are not considerably worse than they are: but we can hardly view with equanimity the consumption of the week, again a thousand standards short of that of the preceding years. Those who hold large stock—and we could point to a London firm or two who are heavily handicapped in this way—must feel the tension caused by the present extraordinary bad state of trade; hence we are not surprised at the brokers' catalogues being so well filled, that being about the readiest way of shaking off the burden of last year's enormous accumulations. The dock deliveries last week, at least those from the Surrey Commercial, show a shortage on the corresponding week of 1885 amounting to 893 standards of deals and battens, 96 standards of flooring boards, and 255 loads of timber, about 1,074 standards altogether.

The system of driving trade at high pressure, which has grown to an unwholesome degree during the past two or three years, is likely to receive a considerable check if things do not shortly mend, as it seems impossible that the nominal profits at which a big proportion of the trade is now carried on can cover the daily increasing risks engendered by a succession of bad years. It is reported from the Swedish side that some of the logs are likely to be hung up for want of water, and we hear that a few of the mills at the upper gulf ports have withdrawn their quotations for autumn shipment on the chance of an insufficiency of logs.

Messrs. Churchill & Sim were by no means favored in the matter of weather on Thursday, the day being most unpropituous for business of the kind they had in hand, the general feeling so prevalent of bad trade being by no means enlivened by the continuous downpour of rain with which the earlier portion of the day was ushered in.

Deals appeared to be out of favor, 1st Bjorneborg 4x10 going as low as £9 5s, and the Fredrikstad parcel of 1st yellow ex Bayard at a similar price, a little lot of good average lengths, reads cheaply enough.

The mixed descriptions represented by the Minna Elkan and the Elise, from Koping, near Stockholm, at £12 15s., were not indicative of any alteration in the market price of such goods; but the 4th Gefle deals ex Merannio, of the Korsnas manufacture, at £7 5s., were decidedly cheap; 4x9 went to £8 10s., but even this, for seasoned goods, is a very low price. Best Petersburg, Gromoff's, hung at £11 10s.; in fact, there was no particular animation amongst buyers, though the benches were well filled throughout the proceedings. There was a good deal of bidding for the St. John spruce ex Rowena, but 1st planks, at £7 a standard, does not afford an encouraging outlook for importation.

Just towards the conclusion of the sale we happened causually to ask a prominent member of the trade who was watching the proceedings, if had anything coming forward, and his answer given with a considerable amount of fervor, was, "Thank heaven, not at present." He, evidently was not pleased at the way things were going.

LIVERPOOL.

The Timber Trades Journal of May 15th says:—What with the prevalence of easterly winds and the interruption to business caused by the general holiday on Wednesday, there has been little of interest to note in the state of trade during the past week.

The absence of any public sales of whitewoods has also tended to keep it in the same monotonous groove it has followed for such a long time past. Even had there been any there would have been small importance attached to them, unless a widely different spirit had been shown to that exhibited at last few recent auctions.

We hope that those to be held next week may prove to be different, but there is no great probability of such occurring, if the reports from the country travellers of the flat and depressed state of trade in tha manufacturing districts are to be believed.

They say that orders are still most difficult to get, and when they are obtained are small in extent, and done on the very narrowest margin of profit.

Stocks in hand, as well as seen from reference to the figures given this week, are not heavy compared with those of last year, but with such a languid condition of business as we are suffering from at present they are in nearly every instance quite ample for the probable demands that may be made upon them for some time to come.

This being the case, it is evident that we can look only to a prolonged reduction in imports if this state of matters is to be altered for the better.

Very little business in c.i.f. or f.o.b. contracts is reported to be done, and shippers agents like most other branches of the trade, are experiencing the greatest difficulty in carrying business through to a satisfactory conclusion.

GLASGOW.

The Timber Trades Journal of May 15th says:—At the public sales held here during the past week transactions have been light, the demand being quiet. Particulars of prices are given below.

Although there has been a good attendance at the auction sale of deals here on the 12th inst., and a varied catalogue submitted, very little business was done. There were some lots afterwards sold privately. Transactions at the sale of log timber at Greenock amounted to over 300 logs.

Imports to Clyde for the week include a cargo of teakwood from Java, consigned to Messrs. Allison, Cousland & Hamilton. This is the first direct importation of teakwood from Java. At Grangemouth several steamer cargoes of deals, etc., have arrived from the Baltic. In the course of a week or two arrivals of Quebec deals at Glasgow per steam liners will begin. The stock of deals in hand is at a pretty low ebb at present, but, as there was last season a larger importation than usual of Michigan 1st pine deals, there is still a considerable balance of these on hand; narrow 1st pine deals are inquired for.

The deliveries of deals and planks from Yorkhill Yards, Glasgow, this year to end of April amounted to 261,675 pieces as against 296,723 pieces for corresponding period last year.

On Wednesday forenoon the saw mills of Messrs. A. Hood & Co., situated to the east of Polmadie Road, Glasgow, were burned down. The damage, estimated at about £2,000, is covered by insurance.

On the 6th inst., at Greenock, Messrs Singleton, Dunn & Co., brokers:—

	Per cub. ft.
	s. d.
Quebec waney boardwood—	
50 & 52 c ft avg per log	1 6
Quebec yellow pine (extra quality)—	
65 c ft avg per log	1 4¾

NEW YORK.

The following is the official list of the prices obtained at the New York Lumber Auction Company's sale at New York on May 11th:—

Lot 1—1½ inch Whitewood, firsts, 9,697 ft.; seconds, 1,552 ft.; culls, 69 ft. $25.

Lot 2—Cherry, 1 inch, firsts, 1,512 ft.; seconds, 2,973 ft.; culls, 228 ft. $51.

Lot 3—Ash, 1½ to 2 inch, firsts, 7,399 ft.; seconds, 2,819 ft.; culls, 90 ft. $29.

Lot 4—Whitewood, 1 inch, firsts, 2,616 ft.; seconds, 5,196 ft.; culls, 414 ft. $21.

Lot 5—Whitewood, 1 inch, firsts, 2,942 ft.; seconds, 6,011 ft.; culls, 392 ft. $21.

Lot 6—Cherry, 1 inch, firsts, 1,220 ft.; seconds, 3,313 ft.; culls, 437 ft. $52.

Lot 7—Walnut, 1, 1½ and 2 inch, firsts, 2,666 ft.; seconds, 6,265 ft.; culls, 677 ft. $62.

Lot 8—Hemlock joist, 508 pieces, 3x4x13. 12 cents each.

Lot 9—Whitewood, 1 inch, firsts, 1,130 ft; seconds, 1,419 ft.; culls, 98 ft. $22.

Lot 10—Whitewood, 1 inch, culls, 11,607 ft. $13.

Lot 11—Walnut balusters, 2x2, 2½x2½, 3x3, 1,655 pcs, and 2,614 ft. $50 per M.

Lot 12—Walnut, 1, 2, 2½, 3 and 4 inch, firsts, 181 ft. seconds, 1,717 ft., culls, 3,071 ft. $38.

Lot 13—Whitewood, 3 inch, firsts, 12,309 ft.; seconds, 8,493 ft.; culls, 224 ft. $31.

Lot 14—Chestnut, 1 inch, seconds, 3,159 ft.; culls, 987 ft. $13.

Lot 15—Whitewood, 1 inch, 2,807 ft.; culls, 8,187 ft. $15

Lot 16—Quartered white oak, 1 inch, firsts, 1,833 ft.; seconds, 827 ft.; culls, 96 ft. $45.

Lot 17—Quartered white oak, 1 inch, firsts, 2,243 ft.; seconds, 1,101 ft.; culls, 208. $40.

Lot 18—Quartered white oak, 1 inch, firsts, 2,401 ft.; seconds, 553 ft.; culls, 119 ft. $47.

Lot 19—Hemlock boards, 1x10x13, 1,000. 12½ cents each.

Lot 20—Hemlock joist, 924 pieces, 2½x4x13. 12 cents each.

Lot 21—Whitewood, 1 inch, culls, 7,415 ft. $13.

Lot 22—Whitewood, inch, culls, 7,757 ft. $14.

Lot 23—Walnut, firsts, 754 ft.; seconds, 1,987 ft.; culls, 75 ft. $69.

Lot 24—Walnut, 1½, 2, 2½, 3, and 4 inch, firsts, 1,207 ft.; seconds, 2,510 ft.; culls, 138 ft. $70.50.

Lot 25—Whitewood, 1 inch, firsts, 3,704 ft.; seconds, 5,748 ft.; culls, 390 ft. $25.

Lot 26—Walnut, 1, 1½, 1½ and 2 inch, firsts, 456 ft.; seconds, 1,714 ft.; culls, 5,607 ft. $44.50.

Lot 27—Whitewood, 1 inch, firsts, 4,426 ft.; seconds, 6 378 ft.; culls, 247 ft. $23.50.

Lot 29—Ash balusters, 2,599 pieces. 2½ cents each.

Lot 31—Whitewood, 1 inch, culls, 4,352 ft. $13.50.

Lot 32—Whitewood, 1 inch, culls, 4,681 ft. $14.50.

Lot 33—Whitewood, 1 inch, culls, 4,866 ft. $14.

Lot 34—Walnut, 1, 1¼, 1½ and 2 inch, culls, 6,474 ft. $35.

Lot 35—Whitewood, 1 inch, seconds, 1,024 ft.; culls, 9,763 ft. $15.50.

Lot 36—White pine shelving, ⅞ inch, common planed two sides, 49,477 ft. $15.50.

Lot 37—Ash, 2, 3, and 4 inch, firsts, 6,421 ft.; seconds 4,368 ft.; culls, 191 ft $26.50.

Lot 38—Whitewood, 1 inch, culls, 11,479 ft. $14.50.

Lot 39—Whitewood, 1½ inch, firsts, 9,585 ft.; seconds, 3,818 ft.; culls, 204 ft. $31.50.

Lot 40—Ash balusters, 4,372 pcs 2x2 in. clear, 2¾ c. each; 3,094 pcs. 2½x2½ in. clear, 4 c. each; 176 3x3 in. clear, 4¾ c. each,

Lot 41—Cherry balusters, 280 pcs. 2x2, clear, and 34 pcs. 2½x2, 5 cents each.

Lot 42—White pine box, 1½ inch, 12,848 ft. $16.

Lot 43—Hemlock joist, 546 pcs. 3x4x13. 13½ cents each.

Lot 44—Walnut, 1¼, 1½, 2 and 2½ inch, culls, 8,803 ft. $34.50.

Lot 45—Whitewood, 1 inch, seconds, 1,502 ft.; culls 9,539 ft. $15

Lot 46—Walnut, 1 inch, culls, [illegible]72 ft. $26.

Lot 47—Walnut, 1 inch, culls, 5,192 ft. $35.

Lot 48—Whitewood, 1 inch, firsts, 3,388 ft.; seconds 6,084 ft.; culls, 565 ft. $26.50.

Lot 49—Ash, 1½ and 2 inch, firsts, 7,392 ft.; seconds, 2,768 ft.; culls, 42. $25.

Lot 50—White ash, 2, 2½, 3 and [illegible] inch, firsts, 1,881 ft.; seconds, 4,031 ft.; culls, 665 ft. $21.

Lot 51—Whitewood, 1 inch, culls, 11,457 feet. $14.25.

Lot 52—Whitewood, 1 inch, firsts, 1,016 ft.; seconds, 5,158 ft.; culls, 4,393 ft. $21.50.

Lot 53—Walnut dimension stuff ¾, 1, 1¼, and 1½ in. 7,829 ft. $27.

Lot 54—White pine, 1½ inch, extra pine cutting up stock, 12,567 feet. $19.

Lot 55—Walnut, 1, 1½, 2, 2½, 3, 4, 5 and 6 inch, seconds, 1,248 ft.; culls, 3,473 ft. $38.

Lot 56—Whitewood, 1 inch, culls 12,170 ft. $14.

Lot 57—Whitewood, 1 inch, firsts, 74 ft.; seconds, 2,838 ft.; culls, 8,299 ft. $16.50.

Lot 58—Ash, 1½ and 2 inch, firsts, 3,030 ft.; seconds, 2,173 ft.; culls 40 ft. $27.

Lot 59—Ash, 2 inch, firsts, 3,011 ft.; seconds, 1,553 ft.; culls, 81. $31.50.

Lot 60—Ash, 1 and 2 inch, firsts, 2,507 ft.; seconds, 1,120 ft.; culls, 19. $31.50.

Lot 61—Whitewood, 1 inch, seconds, 395 ft.; culls, 10,060 ft. $14.

Lot 62—Whitewood, 1 inch, seconds, 1,367 ft.; culls, 8,589 ft. $15.50.

Lot 63—Walnut, 1½, 2, 2½ and 3 inch, seconds, 833 ft.; culls, 6,905 ft. $32.

Lot 63b—Walnut balusters, 2x2x30 to 34 in. 1,020 pcs. 5½ cents each.

Lot 64—Pine shelving, 1x16 common, 15,706 ft $16.

Lot 65—Walnut, 1, 1½ and 2 inch, firsts, 97 ft. seconds, 2,680 ft.; culls, 7,242 ft. $39.

Lot 66—Ash, 1 inch, firsts, 1,832 ft.; seconds, 3,363 ft.; culls, 342 ft. $29.

Lot 67—Ash, 1 inch, firsts, 2,185 ft.; seconds, 2,434 ft.; culls, 152 ft. $31.

Lot 68—Ash, 2 inch, firsts, 7,678 ft.; seconds, 2,720 ft.; culls, 145 ft. $34.

Lot 69—Whitewood, ⅝ inch, firsts, 9,225 ft.; seconds 10,176 ft.; culls, 274 ft. $22.

Lot 70—Whitewood, 1 inch, seconds, 1,006 ft.; culls, 3,666 ft. $14.

Lot 71—Whitewood, 1 inch, seconds, 995 ft.; culls, 4,836 ft. $14.

Lot 72—571 pieces pine roofing boards, 1x8x12, T. G. planed two sides, 4,568 ft. 14½ cents each.

Lot 73—Basswood, 1 inch, firsts, 470 ft.; seconds, 1,159 ft.; culls. 636 ft. $17.

Lot 74—Red oak, 1 inch, firsts, 507 ft.; seconds, 1,149 ft.; culls, 445 ft. $25.

Lot 75—Ash, 1 and 1¼ inch, firsts, 489 ft.; seconds 728 ft.; culls, 48 ft. $27.

Lot 76—Sycamore, 1 inch, firsts, 825 ft.; seconds, 1,543 ft.; culls, 410 ft. $21.50.

Lot 77—209 pcs. pine roofing boards, 1x10x12, and 624 pcs. 1x10x14, 9,370 ft. 17 cents each.

Lot 78—Walnut, 2, 2½, 3, 4, 4½, 5, 5½, 6, 6½ and 7 in., firsts, 250 ft.; seconds, 2,707 ft.; culls, 4,575 ft. $31.

Lot 79—Chestnut, 1 inch, firsts, 213 ft.; seconds, 2,696 ft.; culls, 355 ft. $16.

Lot 80—Whitewood, 1 inch, culls, 10,508 ft. $14.25.

Lot 81—Ash, 2 inch, firsts, 5,510 ft.; seconds, 2,148 ft.; culls, 146 ft. $36.

Lot 82—Ash, 1 inch, firsts, 3,384 ft.; seconds, 2,402 ft.; culls, 85 ft. $35.50.

The next sale will be held on June 8th.

HUGH GIBSON,

MANUFACTURER OF

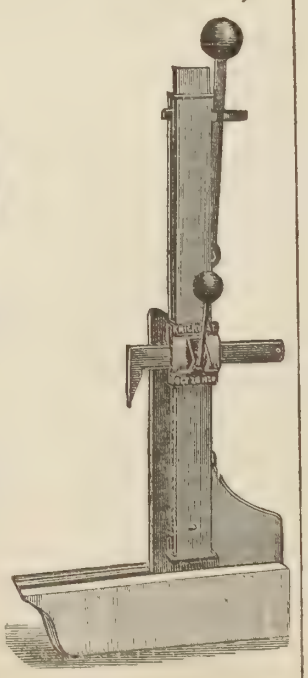
KNIGHT'S PATENT "EXCELLSIOR"

SAW MILL DOGS

The Sawyer's Favorite

For Holding Logs upon a Saw Mill Carriage while being Sawn into Lumber.

These Mlldogs I guarantee to give satisfaction in every case. They will hold a frozen log as well as a soft one, for cutting Scantling, Square Timber, &c. These Dogs cannot be excelled, I sell them all on their own merits, give ten or fifteen days trial, and then, if not satisfactory, return them to my order, as I have no agents on the road this year, I will sell them at a reduced price. Send for Circular and price list.



EXCELSIOR DOG.

AYER'S HAIR VIGOR

Restores the color, gloss, and youthful freshness of the hair; stimulates a rich and luxurious growth; thoroughly cleanses the scalp; prevents dandruff and humors; and is the most cleanly and effective preparation for the hair ever offered to the public. Rev. J. W. Davenport, Illinois Bend, Texas, writes: "Ayer's Hair Vigor, used in my family for several years, has no equal as a dressing, nor for preventing the hair from falling out or turning prematurely gray. It ranks among the first luxuries of our house." Miss Kate Rose, Ingersoll, Ontario, writes: "While keeping my head clear of dandruff, and preventing Scald Head, Ayer's Hair Vigor has also caused my hair to grow luxuriantly, resulting in my now possessing hair forty-two inches long, and as thick as could be desired." The wife of Dr. V. S. Lovelace, Lovelaceville, Ky., had very bad tetter sores upon her head, causing the hair to fall out. Ayer's Hair Vigor healed the sores, and in less than twelve months produced hair a foot long.

PREPARED BY

DR. J. C. AYER & CO., Lowell, Mass., U. S. A.

For sale by all Druggists.

No More Bald Heads.

To produce a new growth of hair on bald heads, in the case of persons advanced in years, is not always possible. When the glands are decayed and gone, no stimulant can restore them; but, when they are only inactive, from the need of some excitant, the application of Ayer's Hair Vigor will renew their vitality, and a new growth will result. L. V. Templeton, Newbern, N. C., writes: "After a protracted illness, with fever, my hair all came out, leaving me entirely bald. I procured a bottle of Ayer's Hair Vigor, and, before I had used all its contents, a thick growth of hair, nearly two inches long, covered my head." L. D. McJunkin, Perryville, Md., writes: "Baldness is hereditary in my family. Five years ago the hair on the top of my head was becoming weak and thin. I procured Ayer's Hair Vigor, the application of which invigorated the hair roots, and sent out a new growth of young hair. To-day my hair is as thick and vigorous as ever. I still use the Vigor occasionally to keep my scalp in a healthy condition."

SUBSCRIPTION

FOR THE

Canada Lumberman

IT WILL PAY YOU, BECAUSE :

1. It is the only newspaper published in the Dominion of Canada devoted to the lumber and timber industries.
2. It is devoted to the development and utilization of our forest wealth.
3. It furnishes complete and reliable quotations of prices of lumber in all the leading markets.
4. Its columns are filled with interesting reading matter, valuable alike to the land owner, manufacturer or dealer.
5. It costs only $2.00 per year to have it sent, post-paid, to any address in Canada, and no land owner, lumber dealer, manufacturer or individual in any way connected with timber industries, can afford to do without it.

TO ADVERTISERS.

It has a circulation among saw mill owners, manufacturers, lumber and timber dealers and all classes connected with the timber business.

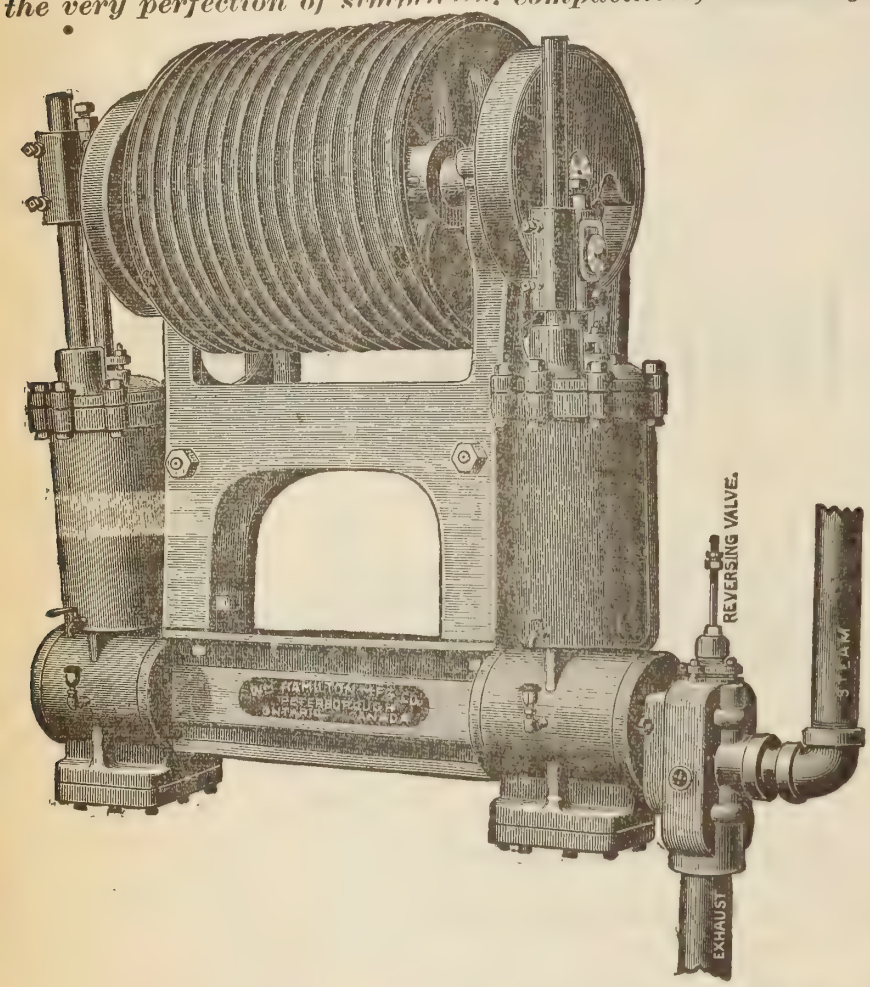
Examine the field, count the cost, and you will at once decide that the CANADA LUMBERMAN is the

CHEAPEST, BEST, MOST RELIABLE and ONLY TRUE MEDIUM

for placing your goods or wares before the saw-mill men and lumber and timber dealers of the Dominion.

CUNNINGHAM'S
PATENT OSCILLATING TWIN ENGINE
FOR STEAM FEED IN CIRCULAR MILLS WITH RACK OR ROPE.

This Engine has practically but two moving parts, aside from cranks and shafts. The whole array of eccentrics, valves, valve rods, connecting rods, cross heads, slides, levers, rock shafts, bell cranks, etc., is done away with, and the very perfection of simplicity, compactness, durability and cheapness attained.



The above engraving illustrates the Twin Engine, 10x16, for Rope Feed, for Saw Mill Carriages. The spool is 27 in. diameter, 30 in. face, is grooved 2 in. pitch for 1½ in. rope. The shaft is steel, 4½ in. diameter, with disk cranks. No connecting rods, eccentrics or valve rods to get loose and out of order. The ports are in the trunions, and worked by an oscilliation of the cylinders, and are held in their place in the downward motion by a steam cushion below. The sawyer's valve is a perfect balance, and by moving this valve the engine can be reversed, stopped or started almost instantaneously if necessary, as the sawyer has perfect control of it by his lever either to go fast or slow. Should the sawyer let go of his lever either by mistake or any other cause, it is balanced so that the valve will come to the centre and cut the steam off both cylinders and stop the feed. When standing, the lever is locked or fastended, so that is is impossible for it to start off itself. The engine stands upright below the carriage, and bolted to two upright beams, placed on the mill for the purpose. When a rack is preferred in place of the rope, we put on a steel wheel 30 in. in diameter, and the engine placed high enough to work into the rack on carriage bar, or if the beams come in the way, an idler wheel can be used between engine and rack segs; or, the engine can be placed at a distance and have a shaft rom it to the carriage; or it can be placed in the engine room, where it is under the control of the engineer for oiling, thence by shaft and pinion to carriage rack bars. These engines are well adapted for cutting long logs, or where the logs are mixed, the advantage of this feed will be apparent to mill men. When the carriages are used in two or more sections, the couplin and uncoup ling of each section is quick and simple.

There were two of these feeds working this summer and giving the best of satisfaction, one with rope feed at James Playfair & Co's Mill, Sturgeon Bay, near Waubaushene, and one at the new mill furnished by us to Francis Carswell & Co., at Calabogie Lake, on the Kingston and Pembroke R. R. This mill is working with the Rack and Pinion feed, and drops from fifteen to seventeen stock boards per minute. We have also sent one to the Rathbun Company, Deseronto, to put in to feed their heavy Circular Mills. They will also commend themselves for various other cases, especially for running Elevators, hoisting Engines, and wherever a simple and easily reversible motion is required.

We would also call attention to our Improved Band Saw-Mill for cutting logs

☞ ***We guarantee this to be the best Mill of his kind got up, and would ask any one wanting a good Band Saw-Mill to communicate with us. We would also call the attention of Mill Men to our new IRON GANGS, CIRCULAR MILLS and MILL MACHINERY. For further information, prices, &c., address the Manufacurers,***

VOL. 6. PETERBOROUGH, ONT., JUNE 15, 1886. NO. 12

HISTORY OF THE SAW MILL.

How surprised I was on seeing in a museum, a long time ago, such things as scissors, seal rings, necklaces, and pairs compasses, that were taken from Egyptian tombs 3,000 years old!

But, after all, men were men 3,000 years ago, and women were women. They had the wants, the needs, the vanities of men and women, and they had brains not unlike our own to supply them.

The most boastful Yankee (not that Yankees are more boastful than other people) in some of the rooms of the British Museum is obliged to confess that the ancients originated a great many good notions which we moderns have only improved upon.

For instance, there are few tools more ancient than the saw. All the ancient nations appear to have had it; certainly the Hindoos, the Egyptians, the Greeks and the Romans. The saw may have existed even before there were any men on earth.

There is a creature called the saw fly, with two saws in its tail, which it actually uses for sawing the stems, leaves and fruits, wherein its eggs are to be deposited. There is also a saw-fish, the long snout of which is a saw. It is said also that the original inhabitants of the island of Madeira found a ready-made saw in the backbone of a fish.

The Greeks had a pretty story attributing the invention of the saw to the accidental finding of the jaw-bone of a snake by one Talus, who used to cut through a small piece of wood. Being a slave, and finding that this jaw-bone eased his labor, he made a saw of iron, and thus gave mankind a new and most valuable tool.

The ancient saws differed from ours in two ways. The teeth were so arranged that the cut was made by pulling instead of pushing; and the teeth, instead of being set one to the right and one to the left alternately, were set so that ten or a dozen in succession were slanted one way, and the same number the other way.

The ancients had several varieties of the implement. The Greeks, for example, had cross-cut saws for two men, also saws for cutting marble into slabs. And they had a kind of tubular saw for hollowing out a marble bath-tub, similar in principle to the method now employed.

Among the pictures uncovered in the buried city of Herculaneum there is a representation of two genii sawing a piece of wood on a carpenter's bench very much like ours and using a saw with a wooden frame similar to those now employed. Still more strange, the frame saw tightened with a rope and stick, such as our street wood sawyers use, was probably as familiar to the Romans as it is to us.

A saw mill, however, by which wind, water or steam is made to do the hardest part of the work, was not known to any ancient nation.

Sawing by hand, next to digging a stiff clay soil, is about the hardest work that men ordinarily have to do. It is therefore not surprising that our ease-loving race began to experiment a good while ago with a view to applying the forces of nature to the performance of this toil.

A learned German investor who has investigated the subject very thoroughly states that the first trace of saw mill yet discovered is in the records of the German city of Augsburg, for the year 1337.

The reference is slight, and does not fix the fact with certainty. But there are two saw mills near that city which are known to have existed as far back as 1417, and they are still used.

Before that valuable invention, all boards and planks were split with wedges, and then hewn to the requisite smoothness with the axe.

The splitting of boards is still practiced in remote settlements, as I myself have seen, and it is recorded of Peter the Great, of Russia, that he had much difficulty in inducing the timber cutters of his empire to discontinue the method. At length he issued an edict forbidding the exportation of split planks. Even in Norway, covered with forests as it was, there was not one saw mill before 1530.

Nowhere in Europe, it appears, was the introduction of the saw mill so long resisted as in England. In 1866 a Hollander erected one near London; but it brought upon the poor man such an outcry and opposition that he was obliged to abandon it.

The sawing of timber by hand furnished occupation, at that time, and long after, to large numbers of strong men.

In every town there was saw pits, as they were called, for the convenience of the sawyers, one of whom stood at the bottom of the pit and the other on the log.

We can easily imagine that when every beam, plank and board, thick or thin, had to be sawed by hand, the sawyers must have been a formidable body, both from their numbers and their strength.

After the failure of the Dutchman in 1663, there was no serious attempt to start another saw mill in England for more than a hundred years

In 1767 an English timber dealer of large capital built a saw mill to be moved by the wind It was t' ought to be a great and difficult enterprise, and it attracted much public attention. Some years before an author had explained the advantages and economy of saw mills; then the society of arts gave the scheme of building one their approval, and, finally, the mill was actually built by an engineer who had studied the saw mills of Holland and Norway.

No sooner was the mill complete than the sawyers assembled in great force and tore it to pieces. The Government compensated the owner for his loss, as was just. Some of the roiters also were convicted and imprisoned.

A new mill was then built, which was allowed to work without molestation, and proved so profitable that others were soon introduced.

In no part of the world, probably, has the saw been more minutely and curiously developed than in Great Brilain, where they have saws so fine as to cut diamonds, and circular saws nine feet in diameter and a quarter of an inch thick.

They have have also veneer saws so accurately adjusted as to cut 18 slices of veneer from a rosewood plank an inch thick.

In London they will put a log of mahogany upon the mill and cut it into slices so thin that the sawdust weighs more than the veneer.

Yankees have beaten this performance. They take a piece of mahogany or rosewood, soften it by steam, and cut it into veneers with a knife, without making a grain of sawdust.

Daniel Webster tells us that his father had a saw mill after his removal to New Hampshire, at the source of the Merrimac river.

Daniel, who was by no means fond of labor at any part of his life, liked nothing better in his boyhood than to attend this saw mill, because when he had put his log in position and started the saw, he had 16 good minutes for rest or reading before the business required further attention.—*Journal of Progress.*

SPRUCE FOR MAKING PULP.

A very large quantity of logs, both spruce and poplar, are now coming into use for grinding up as pulp for newspaper work, cardboards and the like. When the first paper was made from wood pulp it was thought that poplar was the best and perhaps the only wood which could be used, but during the last few years it has been found that spruce wood made better and stronger pulp than poplar. Poplar will always be a much cheaper wood than spruce, because it grows very rapidly and has but few economical uses, outside of the grinding up for pulp and the making of excelsior. Poplar never grows very large but grows quite rapidly. A growth of poplar 16 to 18 inches through at the butt is considered very good growth, although some few specimens may be found of larger growth. After reaching that size in the average New England soils, it seems to lose vitality and finally die. Those who cut poplar for pulp wood cut down some very small trees, even down to few inches in diameter. It is commonly cut into four-foot lengths and sold by the cord, New Hampshire lots fetching from $4 to $5 per cord, probably averaging about $4 per cord. Spruce logs cut up in four-feet lengths are selling at the same time at from $6 to $6.50 per cord, delivered on the cars in various parts of New Hampshire. It is claimed by some that spruce wood does not make so white pulp as poplar, and that the chemicals for bleaching are somewhat more expensive in the case of the spruce, but it is much sought for on account of the strength of its fibre and the better character of the wood. Lumbermen are quite ready to get out a certain percentage of spruce for the wood pulp grinders, because they will take some seamy trees, where reasonably clear and of good growth. Such seamy trees are not profitable for sawing into any kind of lumber. There is a great difference in the color of spruce, that which is very white being much more desirable for the wood-pulp people. Trees of the same variety seem to differ in whiteness or color, probably owing to the soil upon which they grow. Hence some lots are really worth a dollar a cord more to manufacture into wood pulp than other lots, while both might be worth equal prices for manufacturing into ordinary lumber. The pulp business is destined to grow more rapidly in the future even than in the past, for the users of pulp and paper and cardboard are becoming multiplied every year. The inventive genius of the Yankee discovers many new application for a product like this almost every day, and the time is rapidly drawing near when a large quantity of spruce and poplar will be required to meet the demands of wood pulp grinders.—*Manufacturers' Gazette.*

MAKING ESTIMATES.

Powis Bale, in "Saw-mills," gives for cross cutting soft and medium woods a speed of 10,000 feet per minute at the points of the teeth and says he has yet to be convinced that any speed in addition to this serves any useful purpose, or is in any way necessary or desirable. In sawing very hard woods the speed of both the saw and the feed of the wood should be reduced, the former about one quarter and the latter one-half, or even less. He further says suppose a circular saw, say 30 in. diameter and 12 gauge, be put on a spindle and the speed gradually increased till it reaches at the periphery say 12,000 ft. or 13,000 ft per minute, it usually will become wavy and pliant, and run untrue; it therefore follows that not only is the extra speed entirely unnecessary, but it is positively detrimental, as more power is consumed, and more heat engendered in the bearings, spindle, and saw plate, extra lubrication is required, and the belts deterior ate more rapidly.

THE value of planed and finished lumber, sash, doors and blinds, sent from the United States into Manitoba, during the year ending June 30th, 1885, was but $72,000 and the value of undressed lumber was but $22,000.

WHITE PINE EXHAUSTION.

The ably edited *Northwestern Lumberman*, of Chicago, which has frequently critised the estimates given of the pine standing in Michigan and other states, with the intention of showing that they were unreliable, itself recognizes the fact that the forests are being depleted. It says :—

The readers of the *Lumberman* well known that, as a journal, it has never taken the extreme view in reference to the rapid exhaustion of the white pine supply. Yet it has not been unmindful of the fact that the forests of Michigan, Wisconsin and Minnesota could not eternally furnish food for the saw mills. It has also recognized the truth that on most of the area now covered with white pine there can be no second growth of this wood. Indeed it is doubtful if any other state than Maine has a soil or climate adapted to a second crop of pine trees sufficiently sturdy to make saw logs. Even in Maine the sapling pines attain but a limited growth, and are used mostly for the making of coarse box boards, and are not adapted to general lumber purposes. Hence, as each pine tree falls, there is one less in the myriads that stand in the forest, and its place cannot be filled. Even if it were possible to grow another crop of pine, it would not serve to fill the lack that would ensue before the saplings were ready for the market.

Until within the past half dozen years there was very little believed about the comparatively near approach of the end of the white pine supply. Even when it was announced, three or four years ago, that there will be little or no more pine floated out of Cass river, in the Saginaw district, and that lumbering on the Flint was drawing toward an end, western operators paid but slight attention to the statement. It was thought then, and still is, to a considerable degree, that there was, and remains, an inexhaustible supply in the forests of Michigan Wisconsin and Minnesota, and that practically, so far as this and the succeeding generation or two are concerned, the exhaustion of the white pine supply of the northwest is a matter that belongs to some remote future century.

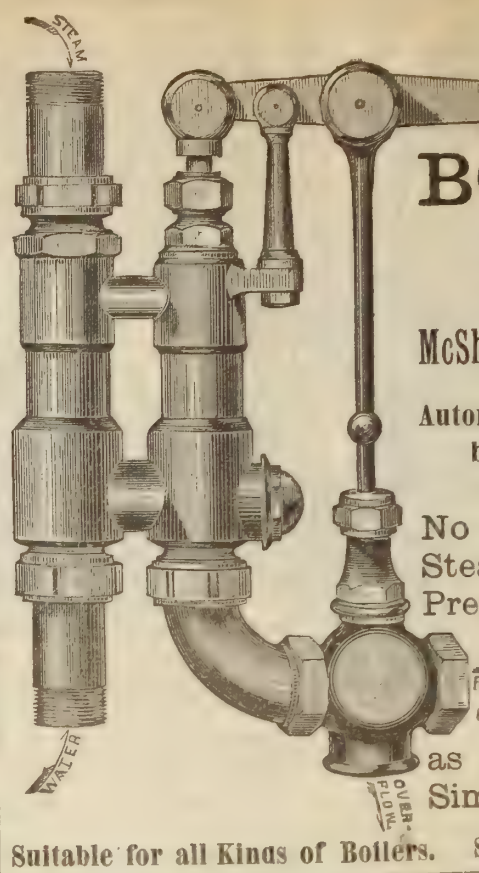
But this view is as extreme as the other that has been rife for twenty years past, which has fixed the limit of pine supply five, ten or fifteen years hence. The prodigious rate at which consumption of pine lumber has proceeded for the past fifteen years is at last visibly telling on the resources of the forests. Not that production has as yet been seriously effected by the coming exhaustion that casts a shadow on present operations ; for, though manufacturers and stumpage owners are beginning to shape their affairs so as to avoid a wasteful slaughter of pine in the future, and husband their holdings as much as possible, there is still manifested a disposition to crowd production a little beyond the consumptive and trade requirement. Undoubtedly this propensity will be exhibited until the supply has been so reduced as to permanently raise the price of both stumpage and lumber to a pitch that will induce a strict economy of forest resources. There are signs of coming restricted supply, however, that must be visible to any one who will open his eyes and look around. The more prominent of these are glanced at, as follows :

The heavier operations of lower Michigan are on the headwaters of the logging streams, quite in the middle of the state, and in the regions where the waters flowing into Lake Huron, and those that run into Lake Michigan, debate the ground for supremacy in drainage. The counties of Roscommon, Crawford, Missaukee, Wexford, Kalkaska, Osceola and Clare, are now the home of the vaster pine forests, while the counties that surround the interior group, though still possessing much pine, are losing their prominence as producers. Twenty years ago the interior counties named were a *terra incognita* to the loggers and mill owners along the lake shores. Now the pine has been so largely cut off on the headwaters of the Muskegon, the Manistee and the Pere Marquette, that log hauls and logging railroads are the rule, and not the exception, as formerly. Great companies are annually taking out 20,000,000 to 40,000,000 feet of logs on the headwaters of all the important streams of lower Michigan, and have reached up to the hardwood belt that covers the northern counties of the state. There are no longer vast stretches of untouched pine in lower Michigan. Nearly every section has been scarred and gored by the operations of the industrious and enterprising logger. How long will it be, under such insatiable conditions, before it will begin to be said that this, that and the other owner has exhausted his pine in the counties that have been named? For several years past mill concern after mill concern has cut its last pine tree on the lower portions of the Grand, the White and the Muskegon rivers, and has closed up its business on that account. Such notable instances as the retirement of the Beidler Manufacturing Company last year, and A. A. Bigelow & Co., this year, from the Muskegon saw mill business, wholly on account of the exhaustion of their stumpage supply, have been common along the Michigan shore within the past half dozen years. Many concerns are keeping themselves alive by buying more pine on the headwaters of the streams. Thus is being concentrated and intensified the final struggle on the backbone of the state. There the battle will end, so far as the lower peninsula is concerned. Not that there will not be scattered pine forests and some logging and sawing in lower Michigan for twenty or thirty, or even forty years to come, but the larger operations will be events of the past before the nearest of these limits of time ; the supply will have been so reduced that rush and competition for volume of business will be no longer possible.

The direction that the product of Michigan mills is taking for market is a noteworthy feature, as bearing on the diminution of the supply. Time was when the Saginaw district and the Huron shore furnished the eastern markets with lumber.

Latterly buyers for the eastern markets have found that the Saginaw and Huron shore supply is not adequate to their needs. Not that there is not enough lumber in those districts, measured by feet, but it is not properly classified for profitable handling ; besides, it is held in close hands, who wring all the speculation out of it. The yard trade in the Saginaw valley is also increasing, and will eventually require a large portion of the stock that once went east by lake. In view of the newer phrases of the Michigan lumber trade, we must conclude that the eastern demand has begun to spread over the supply that was once altogether directed to the westward. What does this mean but that the supply in the older districts is becoming inadequate to the eastern demand ? And must we not conclude, also, that the eastern requirement is year by year increasing, and that whereas probably over 200,000,000 feet of lumber is now sent to the east from mills on Lake Michigan and Lake Superior, the time is near at hand when 500,000,000 feet will take that direction ? In the meantime the western demand will increase in like proportion. This enlargement of the requirement is but slightly taken into account when men talk about the diminishment of the pine supply. It is safe to conclude that the end will draw near with accelerated speed as it approaches, because that, while the supply is growing less all the time, the demand is increasing. Whole mill cuts are now going to eastern markets from north shore and Green Bay ports. An increasing amount is being shipped from points on the east shore. Huron shore mill men already have to buy a part of their log supply in Canada. Muskegon, White lake and Grand river lumbermen are seeking new locations in Wisconsin and in the Lake Superior region. Much of this new enterprise is for the supply of the eastern trade, while that of the prairie states is constantly enlarging. These considerations are corpulent with meaning in reference to the rapid exhaustion of the white pine supply.

It cannot be denied that yellow pine, poplar, cypress and the Pacific coast woods will more and more come into use in the fields where white pine has hitherto been supreme. But all of these woods have a local territory of their own that will need an increasing supply. Aside from this is the fact that nothing has, nor can, fill the place of white pine. The longer it endures the test, and the more it is brought in sharp comparison and competition with other kinds of lumber, the better does its reputation become. So it is plain that nothing can prevent the enormous consumption of white pine lumber and the rapid diminution of its forest supply.



THE IMPROVED

BOILER FEEDER,

WITH

McShane's Patent Improvement.

Automatic and Positive in its action by moving a simple handle or lever.

No regulating of Water or Steam. Works at Any Pressure. Lifts as well as a Pump. No open over-flow. A boy can start or stop it as well as an engineer. Simple and Effective.

Suitable for all Kinds of Boilers. Send for Descriptive Circulars.

T. McAVITY & SONS,

ST. JOHN, N. B.

THE MANAGEMENT OF STEAM BOILERS.

The following rules for the management of steam boilers are laid down by the Hartford Steam Boiler and Inspection Company :—

1. Condition of Water.—The first duty of an engineer, when he enters his boiler room in the morning, is to ascertain how many gauges of water there are in his boilers. Never unbank or replenish the fires until this is done. Accidents have occurred, and many boilers ave been entirely ruined from negligence of this precaution.

2. Low water—In case of low water, immediately cover the fires with ashes, or, if no ashes are at hand, use fresh coal. Don't turn on the feed under any circumstances, nor tamper with or open the safety valves. Let steam outlets remain as they are.

3. In cases of foaming— Close throttle, and keep closed long enough to show true level of water. If that level is sufficiently high, feeding and blowing will usually suffice to correct the evil. In cases of violent foaming, caused by dirty water, or change from salt to fresh, or vice versa, in addition to the action above stated, check draught, and cover fire with fresh coal.

4. Leaks—When leaks are discovered they should be repaired as soon as possible.

5. Blowing off—Blow down, under a pressure not exceeding twenty pounds, at least once in two weeks—every Saturday night would be better. In case the feed becomes muddy, blow out six or eight inches every day. When surface block-cocks are used, they should be often opened for a few moments at a time.

6. Filling up the Boiler —After blowing down, allow the boiler to become cool before filling again. Cold water pumped into hot boilers is very injurious from sudden contraction.

7. Exterior of Boiler—Care should be taken that no water comes in contact with the exterior of the boiler, either from leaky joints or other causes.

8. Removing deposit and sediment—In tubular boilers the hand-hole should be often opened, and all collections removed from over the fire. Also, when boilers are fed in front, and blown off through the same pipe, the collection of mud or sediment in the rear should be often removed.

9. Safety Valves— Raise the safety valves cautiously and frequently, as they are liable to become fast in their seats, and useless for the purpose intended.

10. Safety Valve and Pressure Gauge—Should the gauge at any time indicate the limit of pressure allowed, see that the safety valves are blowing off

11. Gauge Cocks, Glass Gauge—Keep gauge cocks clear, and in constant use. Glass gauges should not be relied on altogether.

12. Blisters—When a blister appears there must be no delay in having it carefully examined, or patched as the case may require.

13. Clean Sheets— Particular care should be taken to keep sheets and parts of boilers exposed to the fire perfectly clean ; also all tubes, flues and connections, well swept. This is particularly necessary where wood or soft coal is used for fuel.

14. General Care of Boilers and Connections —Under all circumstances keep the gauges, cocks, etc , clean and in good order, and things generally in and about the boiler room in a neat condition.

MARMORA.

DROWNED.—The Campbellford *Herald* says that a telegram was received at the Rathbun office, Campbellford, conveying the intelligence of the drowning of Philip O'Hara, a young man in the employ of the company, which took place in Crow River, at Marmora, on May 29th. The deceased was crossing a river in a boat, in company with Dan Murphy, intending to land on an Island midway in the stream ; but before reaching it the men were capsized and thrown into the water. Murphy started to swim ashore, but returned to the boat. O'Hara, who was able to swim, did not seem to do much to help himself, and sank a short distance from where the boat was overturned.

A Lady's Secret.

"I'd give a good deal if I had such a pure, healthy skin as you have," said a lady to a friend. "Just look at mine, all spots and blotches, and rough as a grater. Tell me the secret of your success in always looking so well." "There is no secret about it," was the reply, "Dr. Pierce's 'Golden Medical Discovery' cleansed my blood, and when that was done my skin, which was worse than yours, began to look smooth and healthy, as you see it now."

CANADIAN PACIFIC RAILWAY.

Ontario and Quebec Division.

CHANGE OF TIME.

To take effect Monday, November 2nd, at 1 a.m. Trains arrive at Peterborough as follows:

From the West.

12.31 p. m.—Mail from Chicago, Detroit, St. Thomas Galt and Toronto.
9.05 p. m.—Mixed from Toronto and Intermediate Stations.
10.56 p. m.—Express from Toronto and West.

From the East.

5.31 a. m.—Express from Montreal, Ottawa and Perth.
7.25 a. m.—Mixed from Havelock and Norwood.
11.48 a. m.—Express from Winnipeg via Carlton Junction.
6.42 p. m.—Mail from Montreal, Ottawa, Smith's Falls, and Perth.

Trains depart from Peterborough as follows:

Going East.

2.31 p. m.—Mail for Perth, Smith's Falls, Ottawa and Montreal.
9.10 p. m.—Mixed, for Norwood and Havelock.
10.56 p. m.—Express, for Perth, Smith's Falls, Ottawa and Montreal.

Going West.

5.31 a. m.—Mail, for Toronto, Galt, St. Thomas, Detroit and Chicago
7.25 a. m.—Mixed for Local Stations, West to Toronto.
12.31 a. m.—Express for Toronto and points west.
6.42 p. m.—Express for Toronto and Intermediate Stations.

NOTE—12.30 a.m. train from Winnipeg, runs daily, Tuesdays excepted.

Through Coupon Tickets supplied to all points of the United States and Canada.

C. P. R. Ticket Agent, George Street Peterboro

TORONTO MUSICAL FESTIVAL.

CALEDONIA CURLING CLUB BUILDING.

SEATING CAPACITY, 8,000.

15TH, 16TH, AND 17TH JUNE, 1886.

F. H. TORRINGTON, MUSICAL DIRECTOR.

The Greatest Musical Event in Canada —A Congress of Musical Notabilities —1,000 Selected Singers in one Chorus—100 Selected Musicians in one Orchestra, and a Supplementary Chorus of 1,200 Children, in Gounod's Sacred Trilogy, "Mors et Vita."

Handel's Sublime Oratorio.

"Israel in Egypt," a Festival Matinee,

Consisting of Vocal and Instrumental Selections and a **Children's Festival Jubilee and Miscellaneous Concert.**

PRICES.—Season Tickets (4 concerts) with reserved seats on ground floor, $5; in gallery, $6.50; Single Ticket to each Concert, with reserved seat on ground floor, $1.50; in gallery, $2; Single Ticket, without reserved seat, $1.

Plans now open at Messrs. Mason & Risch's, A. & S. Nordheimer's and L. Suckling Son's, Music Stores, Toronto.

Parties living at a distance may secure reserved seats by application in writing, enclosing the necessary funds in cash, P. O. order, or bank draft, to the Hon. Secretary, JNO. EARLS, 14 Adelaide Street East, Toronto, or from any of the above firms, from whom official programmes, with plan of the Hall, may also be obtained. **Excursion Rates by all Railroads are being arranged.**

Liebig's Condensed Mineral Waters **CARLSBAD CURES** Biliousness, Liver Complaint, Dyspepsia, Rheumatism, etc.

TO MACKINAC.

Summer Tours.

Palace Steamers. Low Rates.

REMOVED.

J. J. TURNER

Sail Tent and Awning Maker

Has removed from Port Hope to Peterborough. Any person wanting a good Tent or Awning will find him on Water Street, opposite the Market, next to Parker's Dye Works. Tents of every description in stock and made to order. Also Horse and Waggon Covers, Rick Cloths, Waterproof Clothing, in fact anything and everything from a needle to an anchor.

J. J. TURNER, Sail, Tent and Awning Maker, Market Block, Peterborough.

DUNN'S BAKING POWDER

THE COOK'S BEST FRIEND

CANADIAN WOOD EXHIBITS AT THE COLONIAL EXHIBITION.

The *Timber Trades Journal* of May 22nd says :— Prominent amongst the exhibits at South Kensington stands the timber produce of the various countries represented. Specimens of the forest growth of Canada, Australia, India, and the Cape are conspicuous in their natural state as well as sawn and polished, attracting the attention even of those who, from the want of a more intimate knowledge, are unable to appreciate the important part they play in the world's history. We have heard visitors express their admiration of the beautifully polished surface of the fine log of Jarrah timber which adorns the Australian Court, and certainly they had reason, for a more splendid specimen of that durable tree could not have well be selected, and the way it has been prepared for display does credit to those who had the work to do.

It is not our purpose to discourse of the various woods in the order that they meet the eye of the visitor as he makes the range of the exhibition, but to take them rather one in each department, in the order of their utility, writing of those first which are in most common use. In this way our task will first embrace the woods from Canada, of which the different varieties, characteristic of the country are artistically grouped in convenient places for inspection. It is the vulgar idea that the wooded portions of Canada form enormous tracts of dark, gloomy-looking forests of pine, their sombre appearance unrelieved by any variety of tint. There never was a greater mistake made. The forests of Canada, on the contrary, are picturesque and pleasing to the eye, and in the season when the leaves begin to change the tints present many different shades and colours, lending to the wood an enchanting aspect, the same as a forest here would appear in Autumn, somewhat enhanced by the majestic proportions of the trees in the Dominion.

As with us here, the pine tracts are peculiar to themselves, and whole sections of this useful tree and its near relation, the spruce, cover the hillside in dark belts, contrasting with the other varieties, forming a background which adds to the beauty of the Canadian scenery. The enormous size and straightness of the pine trees, of which these boundless fir forests are composed, we have very little experience of here. Trees of immense girth we undoubtedly possess, and our ancient oak and elms afford us specimens that often attain considerable altitude; but the huge stem of a Canadian pine of equal circumference, 80 or 90 feet, without a leaf or branch, its lofty top crowned with the long and drooping fronds of needle-shaped leaves, is a sight seldom to be met with in the forests of the mother country.

There is not, of course, the same undergrowth in the timbered portion of the northern countries as there is in milder climes, but with this exception the difference in the appearance of the woods is not so marked. The forests of Cauada are composed of pine, spruce, Scotch or Norway fir, oak, ash, elm, maple, birch, beech, larch, cherry, walnut and other woods, and hardly a tree which we have named which does not come to our shores, though they do not always figure in the public sales.

Our readers are sufficiently acquainted with the merits of the white pine, or, as it is called over here, yellow pine, to need any description from us, but the various specimens supplied by Messrs. Burstall & Co. show of what a high finish it is capable in conjunction with its other preferential claims as an indispensable building material.

The chief of the timber districts, or, as they are termed "limits," of the Dominion, extend from the mountain shores of British Columbia, washed by the Pacific, containing immense forests, yielding some of the finest timber in the world, that are yet practically untouched, to the Province of Ontario, the shores of Lake Huron and Superior, the Georgian Bay country, embracing the Nipissing and Muskoka rivers to the district drained by the Ottawa, St. Maurice, and Saguenay, to the Bersimis (both noted pine regions), and further on to St. John and the lower ports, where the mighty river empties itself into the Atlantic.

From this vast territory, thickly wooded with every species of timber, there is little fear of our supplies running short.

The inroads which have already been made are undoubtedly sufficiently extensive to cause apprehension of a failure in the cut of pine, but the question of forest exhaustion is still too remote to be seriously discussed at present. Many of the forests in the lake districts, Ontario and other Provinces, are yet hardly touched, the land not being so suitable for agriculture, and from these regions sufficient pine will be drawn to make up for any deficiency that may be apprehended from the destruction of the older timber limits for many years to come. The importance of the forest supply of Canada to us here can hardly be estimated. Our annual consumption of pine and spruce is something marvellous, and it would be little short of a calamity if any failure took place in the forest resources of the Dominion.

We hear a good deal of the increasing scarcity of white pine, a tree which is said to be so valuable that it would be difficult to find a substitute for it were Canadian forests to become exhausted. But this can hardly ever happen, if ordinary care is exercised to prevent destructive fires, as it will grow and flourish on the poorest soils, and is a rapid grower. Mr. Small, in his account of Canadian forests, says that "intelligent lumberers consider that a white pine forest renews itself every twenty years." This must be an important consideration in estimating the forest wealth of Canada.

It seems that the wanton destruction of the forests in the Province of Quebec was complained of by the French Governors of Canada as far back as 1696, that is 190 years ago, but the record says that nothing was done by them to check it, and little has been done since. Is it not clear that nature has not again and again made good the ravages of man, and that still more pitiless enemy, the devouring element of fire, during the ages that have since intervened, and that she is still able to set the destroyers of her forests at defiance?

In addition to the thousand and one industries that cannot be carried on so well without the assistance of soft convertible timber, we have railroads and railways, which in the shape of sleepers, ties, platforms, stations, carriages, waggons, &c., add largely to the consumption of the forest produce.

The woods of British Columbia at the exhibition are particularly noticeable, a large ornamental erection of pine from that couutry, supplied by the Hastings Saw-Mill Company, Burrard's Inlet, being the first object that meets the gaze on entering the Canadian Court.

The woods from St. John were in a prominent position, a panel of each kind being scientifically arranged, the polished surface adorned with a neatly executed painting of the leaf,

We inspected the different specimens from New Brunswick, which include beech, ash, maple, birch, white and black hemlock, white pine, red pine, balsam fir, as well as black and white spruce. Amongst the woods not generally shipped to this country, but many of which, we think, could be used here with advantage, are the cherry, plum, bilbury, poplar, alder, hornbeam, butternut and willow, lime and basswood. Poplar is largely used in the States for a variety of purposes, and cherry is also in demand.

Ottawa, in addition to pine, is represented by neatly arranged specimens of sugar maple, red oak, figured beech, and from Burrard's Inlet, in addition to the pine specimens already mentioned, are some well-prepared blocks of red cedar and Oregon pine.

The specimens outside the court are sections of canoe, birch, tamarac, Ottawa best pine, Norway pine and red pine from Ontario, used as mining timber, the collection being sent by Mr. T. A. Keefer, of Port Arthur. There are several pieces of tamarac, black larch, aspen, poplar of very fine and smooth grain, another variety being the jack, or scrub pine. The suitability of many of these woods for use here depends on the cost. The home-grown woods, of which these would have to take the place, are plentiful, and, unless something were gained in size or price, their introduction would not be rewarded with success. A considerable objection to the softer kinds, such as poplar, tamarac, hacmatac, &c., is that they will not take the plane like the pine or deal, and in that respect present a marked contrast to the non-resinous woods of the north of Europe, all of which smoothen up equally to the red or yellow descriptions.

Hamatac ranks with our larch or juniper, and is the most durable of all the pine tribe. For shipbuilding purposes it is considered in the United States more durable even than oak, and it is well known and appreciated at Lloyd's in their classification of ships.

It is not to be expected that, within the limits of a single notice we can describe, even superficially, the various objects of interest in the wood department alone; and we have already occupied as much space as can be conveniently appropriated to the subject this week. What, therefore, has further to be said of this wonderful collection must be deferred to another number.

MICHIGAN HARDWOODS.

It is a very common thing to find in the columns of the contemporary press, says the Michigan *Tradesman*, exhaustive articles deprecating the rapid destruction of the pine timber in Northern Michigan, accompanied by startling statistics, showing that, at the present rate of denudation, the supply of pine will be practically exhausted in a few years. While in many instances these statistics and conclusions are very wide of the mark, there is pith in the main idea underlying them, and ample material for reflection. But the apostles of forestry in their eagerness to inveigh against the wholesale conversion of pine forests in lumber, too often overlook a species of waste which is infinitely more mischievous than the operations of the pine industry, viz., the waste of hardwoods by the logging operations of settlers. If this destruction were confined to legitimate lumbering processes the case would at least have mitigating features. But in many instances the waste is purely wanton; and wanton waste is under all circumstances to be deplored. The soil which grows hardwood timber is well known to be richer, and more perfectly suited for agricultural purposes, than that on which pine is commonly found. For this reason the hardwood lands suffer most severely from the hands of the settler. The fact that the ultimate value of Michigan hardwoods is but imperfectly and not generally understood, also favors the destruction. The average settler knows that the immediate revenue to be derived from his hardwood lands will be greater if he brings them under cultivation than if he leaves the forests inviolate; hence, he proceeds to get rid of the timber as quickly as possible, by gathering into log-heap and reducing it to ashes

The exigencies of agriculture, of course, are not to be ignored. It is absolutely necessary that a certain proportion of the land should be cleared and placed under cultivation. But American farmers too often labor under the mistake that the measure of successful husbandry is in the area of land under tillage. Many of them have yet to learn that a small farm, well cultivated, may be made more profitable than a large farm carelessly cultivated; and that it would be true economy to clear a much smaller proportion of their hardwood lands than is customary, leaving the timber on the remainder to increase in value, as it will inevitably do in the near future.

Northern Michigan possesses magnificent possibilities (which can be realized if she husbands her resources) for the manufacture of hardwood products. Situated in the central portion of the vast Northwest, between two great inland seas, which afford easy and cheap transportation to the markets both of the East and West, her facilities for the profitable disposal of her wares are all that can be desired. Her forests abound in an excellent variety of woods suitable for manufacture, and her numerous streams flowing through the heart of the hardwood regions, afford cheap and abundant power for manufacturing purposes. In short, the natural advantages of Northern Michigan for wood manufacture are unsurpassed, and only await the enlistment of extensive capital and enterprise to raise them to an important position. Already the good work has begun, Handle factories, bowl mills, spoke and hub factories, basket factories, etc., have been established at various points with favorable results. But the development of these industries is yet in an incipient stage. For the full realization of the manufacturing possibilities of Northern Michigan, we must look to the future. A large proportion of the smaller class of articles manufactured from hardwoods, now comes from Maine and other New England states. There is no good reason why the markets of the West and Northwest should not be supplied from the vast reserve of raw materials lying at their thresholds; and they certainly will be so supplied in the not distant future, if the settlers of Northern Michigan do not, in the meantime, render such a result impracticable, by the wanton destruction of the vast forest wealth which are indispensable to the establishment of an extensive manufacturing system in the line of hardwood products.

A LOG CARRIER.

There is being built and nearing completion at the shipyard of Capt. James Davidson, of West Bay City, a vessel which is a novelty in more ways than one.

In the first place she is the first vessel ever constructed specially for the purpose for which she is intended,—transporting saw logs from the place where they are harvested or put into the water to the mill which is to convert them into lumber, and in this respect she is an experiment, although the projectors and owners have the utmost confidence in the enterprise.

In the next place she is a novelty as well as a wonder from the fact that she will be the largest vessel which has ever been put afloat on the great inland seas on this continent. Her capacity is 3,500 tons and she will carry 700,000 feet of saw logs, or 2,500,000 feet of manufactured lumber, sufficient to load an ordinary tow of vessels plying between the Saginaw river and the distributing centres; or in other words, she will carry as much lumber as six ordinary lumber barges. She is 175 feet long, 51 feet beam and 12 feet depth of hold. The reason for her comparative slight depth of hold is the fact that no logs are to be put below the deck for transportation, but they will be loaded entirely on deck. She has on board machinery, and all the appliances for loading the logs expeditiously; and hence can be loaded and unloaded in an incredible short space of time. She is a veritable floating monster or will be when she is launched next week. She has five centre gunwales, from bottom to deck, all edge-bolted, the same as a centre board box and diagonally braced on each side of gunwale and fore-locked on gunwale. The name of this laviathan of the lakes is to be the Wahnapetae, which is the name of the river in the Georgian Bay country from whence she is to transport logs to West Bay City and Tawas. Her cost is $55,000, and she belongs to Emery Bros., who own pine in the Georgian Bay country and projected the enterprise.

There is also being built at the same yard, and nearly completed, and which will be launched about the same, a large lake tug, to tow the above vessel. She is a beauty, and will cost $17,000. She is to be called the Temple Emery, after one of her owners.—*Lumberman's Gazette.*

Minnesota Lumber Trade.

A dispatch from Minneapolis, May 20th, says:—The receipts of lumber in Minneapolis the last week amount to 132 cars and in St. Paul 365 cars. The shipments from Minneapolis reached 233 cars and from St. Paul 229, substantially the amount received and shipped last year. The farmers in the northwest, now that their seeding is done, are preparing to make such improvements in the building line as their funds will permit. The bulk of the trade, however, continues to be from the cities. The local trade is exceedingly good in both St Paul and Minneapolis. None of the Mississippi mills at St. Paul, Minneapolis and above have yet started, though all the drives are coming on well except the main river drive, which is coming slowly. The Minneapolis mills will probably start about the first of June, though there are but few logs yet in the boom.

Chips.

It was estimated that the strike of the yard hands in Chicago entailed a loss of $10,000 on the laboring men of Muskegon, Michigan.

A. T. Stone recently shipped 110 000 maple trees from Manton, Mich., for resetting on his tree claim in Dakota.

Gilmour's big mill at Trenton commenced operations on May 3rd. The drive of logs down the Trent is expected here this month.

It is said that the Ontario Lumber Company are making preparations to rebuild Dollar's mill. The mill will be completed this fall.

The first drive of logs down the Moira has all arrived at the Bay of Quinte and booms of them are being taken to Trenton and Deseronto.

It is reported from Manistee that Milmo & Stokoe, of Jeanerette, La., are trying to introduce cypress lumber and shingles in that market.

Late hemlock and hardwood land purchases within a few miles of the mouth of the Menominee, in Wisconsin and Michigan, are said to amount to 12,000 to 15,000 acres.

The oldest and the largest tree in the world is a chestnut near the foot of Mount Etna, Italy. The circumference of the main trunk is 212 feet.

Do not force a boiler. If you do you are liable to soar upwards some fine day, and brickbats, hot water, steam and pieces of the overburdened boiler will go with you.

The gang board or plank has an ancient history. It was the plank of the ship that passed from stem to stern across the seats of the rowers, and along which they passed, and upon which the mast was laid when it was unhipped.

A simple method, which is very closely correct, is as follows: The sum of the diameter of the roll and the eye in inches, multiplied by the number of turns made by the belt, and this product multiplied by the decimal .1309, will be the length of the belt in feet.

On May 29th, at Sandy Cove, Ont., a boy named Greaves, son of Wm. Greaves, was drowned near Thos. Greave's saw mill. The men at the mill went to the rescue, but were too late, and while they were away the mill took fire and was burned, together with a large quantity of lumber and logs.

Messrs. McArthur & Thompson's drive containing over 14,000 logs, says the Minden *Echo*, has passed this point and now hurries onward with rapid pace towards their destination. We understand these enterprising lumbermen will be on the market next season, buying all kinds of timber and railway ties.

Quinine, an important article of medicine, much used in fevers, ague, &c., is obtained from Peruvian bark, cinchona, or Jesuit's bark. It obtained its name cinchona from the Countess del Cinchon, wife of the Conde del Cinchon, Vicerory of Peru, who first sent the bark to Europe, and Jesuit's bark because it was introduced into Spain by the Jesuits, who had it sent to them by their brethern in Peru.

The Port Arthur Lumbering Company, of Port Arthur, Ont., cut 750,000 feet of logs at its limit on Cloud river, the past winter, employing 30 men in the woods. The same company last season cut 3,000,000 feet on Pine river, but owing to low water the logs were hung up. An effort will be made to drive out these logs this spring. Hammon & McDougall, at Fort William, near by, last winter, got out 30,000 ties, 300 piles and 1,500 cords of wood, employing 60 men at Fort William and Fire Steel river.

LUMBERMEN AT WAR.

There is trouble among the lumbermen of Isabella county, Mich, over-running logs in the Chipewa river. Recently Judge Hart, of that county, granted an injunction forbidding Leaton & Upton from obstructing navigation at Pares Brothers' dam at Mount Pleasant, which prevented the running of 50,000,000 feet of logs A second injunction to interfere with the log drivers was granted, but has since been dissolved Last week the ill feeling between the Saginaw lumbermen and the Isabella mill owners broke out in violence. The log drivers took forcible possession of the Woodin dam, and Woodin's men attempted to interfere they threw two of them into the river. In consequence three of the gang have been arrested on the charge of attempted murder. The hard hard feeling is spreading all over the vast lumber region that feeds the Muskegon and Seginaw mills This bitterness was evidenced in what happened at Mount Pleasant one morning, when a dynamite cartridge was exploded under the dam of Harris Brothers. Great timbers were torn up and thrown one upon the other and the water was rapidly lowered. This dam was used as a feeder to float down the logs. The injury to the dam is several hundred dollars, while the loss of the log drivers will be up in the thousands.—*Timber Trade Journal.*

SPEED OF CIRCULAR SAWS.

It highly entertaining to run accross the estimates made years ago of the pine standing in Michigan, In 1869 the Hon. John F. Drigg, in "an elaborate and carefully prepared statement," put the figures at 15,000,000 000 feet less than there are standing to-day on the upper peninsula. Three years later C. B. Headley, considered to be well posted, went the honorable gentleman 2,000,000,000 better. Mr. Headley thought that the maximum cut in the Saginaw valley would be reached in 1873. By 1873 the production was 619,000,000 feat in round numbers, and in nearly 10 years of the prophesy the figures run up to 1,000,000,000. In 1872 Colonel Ben Wait said there were 43,000,000, 000 feet of pine in the state. Since Mr. Wait set those figures as much pine has been cut in Michigan as he named, and doubtless, if asked he would reply that there is now standing nearly, if not quite, as much more. A dozen years ago Mr Wait was the most liberal estimator whose figures got into cold type, but as seen, even he was not liberal enough by 100 per cent.—*North Western Lumberman.*

Forest fires have begun to rage this early in the season, says the *Northwestern Lumberman*, having broken out in Michigan and Wisconsin. Notwithstanding the large amount of property destroyed annually by such fires there has been no way devised to prevent them. Hunters, land-lookers and others, tramping through the forests will not use due care; and the boy who makes a pile of brush and burns it, more for the fun than any other reason, is rarely mindful of the results. Lumbermen cannot charge these fires to the carelessness of others wholly, for following their operations they leave scattered over the ground twigs and brush that when dry make fuel that catches fire quickly, and burns fiercely. It strikes us that standing pine is now worth so much that it might possibly prove a big investment for the owners of it to use at least as much precaution to protect it from destruction as they would other property of equal value.

Exportation of Canadian Pine.

Ottawa, June 5.—Mr. R. A Loveland, of East Saginaw, had an interview to day with the Commissioner of Customs in reference to the exportation of a large quantity of Pine logs cut by the Emery Lumber Company during the past winter on French river, which enters into Georgian Bay. From information conveyed by that gentleman, it appears nothwithstanding the increased export duty the Americans still consider it possible to carry on a profitable business in that direction.

Special despatches received at Milwaukee, Wis., state that fires are raging in the timber lands along the Escanaba River, involving a loss of thousands of dollars. Forest fires are also burning at Junction City and in the vicinity of Sturgeon Bay, and are raging fiercely along the lines of railroad north and south of Phillips, Wis.

Perhaps the most extraordinary that success has been achieved in modern science has been attained by the Dixon treatment for Catarrh Out of 2,000 patients treated during the past six months, fully ninety per cent. have been cured of this stubborn malady. This is none the less startling when it is remembered that not five per cent. of the patients presenting themselves to the regular practitioner are benefitted, while the patent medicines and other advertised cures never record a cure at all. Starting with the claim now generally believed by the most scientific men that the disease is due to the presence of living parasites in the tissues, Mr. Dixon at once adapted his cure to their extermination; this accomplished the Catarrh is practically cured, and the permanency is unquestioned, as cures effected by him four years ago are cures still. No one else has ever attempted to cure Catarrh in this manner, and no other treatment has ever cured Catarrh. The application of the remedy is simple and can be done at home, and the present season of the year is the most favorable for a speedy and permanent cure, the majority of cases being cured at one treatment. Sufferers should correspond with Messrs. A. H. DIXON & SON, 305 King street west, Toronto, Canada, and enclose a stamp for their treatise on Catarrh.—*Montreal Star* 1y122.

TUG FOR SALE

Now on Georgian Bay. Gross tons, 55.99; Length, 70 feet; Breadth, 15 feet; Depth, 8 feet. Was Re-built last Summer. Apply to

FOR SALE
VALUABLE
Timber Limits
AND
50,000 SAW LOGS
ON SEVERN RIVER

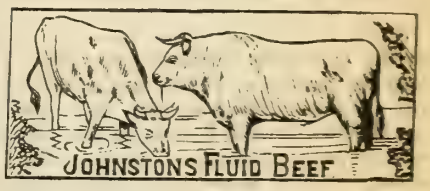
The undersigned being desirous of confining their operations to their Lakefield Mills on the Trent waters, offer for sale the following limits:—

Township of Hindou, 70 square miles.
" Oakley, 45 " "
" Redout, 22 " "
An area of 137 square miles.

These limits are estimated to contain 180 million feet of Logs, well watered, and afford means of short hauling from all points, and quick and cheap driving to Georgian Bay. Are offered for sale together with plant, depots, farms, 1,200 acres deeded lands and 50,000 logs, nearly all of which are on the main river, a large proportion of which are 16 feet long. Apply to

R. & G. Strickland,
3mL LAKEFIELD, ONT.

Johnston's Fluid Beef



The nourishing, palatable and warmth giving qualities of Johnston's Fluid Beef has caused this invaluable preparation to before a favorite and fashionable beverage for the winter season. It is now obtainable on draught at the leading hotels and restaurants throughout the Dominion 18L7

All communications, orders and remittances should be addressed and made payable to THE PETERBOROUGH REVIEW PRINTING AND PUBLISHING COMPANY (LIMITED), Peterborough, Ont.

Communications intended for insertion in the CANADA LUMBERMAN, must be accompanied by the name of the writer, not necessarily for publication, but as a guarantee of good faith. Communications to insure insertion (if accepted) in the following number, should be in the hands of the publishers a week before the date of the next issue.

Advertisements intended for insertion in any particular issue should reach the office of publication at least four clear days before the day of publication, to insure insertion.

The CANADA LUMBERMAN is filed at the Offices of MESSRS SAMUEL DEACON & Co., 154 Leadenhall Street, London, England, who also receive advertisements and subscriptions for this paper.

PETERBOROUGH, Ont., JUNE 15, 1886.

A GROWL FROM MONTREAL.

THE Montreal *Herald* is dissatisfied with the action of the Dominion Parliament in increasing the log export duty. It claims—and quotes from the Trade and Navigation returns to sustain its claim—that there has been no reckless export of timber in the rough, and that, therefore, the increase was unnecessary, or "silly," as the *Herald's* choice phrase reads. But the *Herald* has evidently ignored recent events and must have shut its eyes to current news. United States lumbermen have purchase largely of limits in Canada, but they have made no preparations towards erecting mills. Instead, we hear of barges and steamers being built on an extensive scale, for the purpose of carrying the logs from the Canadian shores to Michigan, to be there sawn into lumber. These purchases and preparations for exporting the logs are much more extensive than they have been on any previous year and all indications go to show that they would have increased had not the Parliament stepped in to protect the Canadian forests and the interests of the Canadian lumbermen. If the United States lumbermen wish to work Canadian limits let them build mills on this side of the line, or at any rate let the Canadian manufacturers be placed in such a position that the foreigner, who does not give us the benefit of the labor of manufacturing, shall not have an advantage over them on account of the operation of the tariffs. This is what has been done, and efforts to undo what has been accomplished will have little chance of being successful.

GOING TO EXTREMES.

WHILE approving of the action of the Dominion Parliament in increasing the export duty on logs, the Montreal *Star* wishes it to go farther and impose an export tax on sawn lumber. It is not at all likely that the *Star's* advice on this point will be accepted or acted upon. One reason why the export duty on logs was increased was because the Canadian manufacturers were, under the former tariff, placed at a disadvantage as compared with the American exporter of logs, and it was thought desirable to relieve the manufacturers from this disadvantage.

At present the Canadian lumbermen are compelled to pay the duty imposed by the United States custom laws and, weighted with this burden, compete with the lumber producers of that country. If they were compelled to pay the Canadian Government for the privilege of taking the lumber out of this country, and to pay the United States for the privilege of taking it into that country, they would be unable to compete with the lumbermen who had no customs duty to pay at all. The lumber industry of Canada is too valuable to be stamped out by ill-considered legislation.

An export duty would not only effect the trade with the United States, but with other countries. The Canadian lumber or timber dealers to push trade, have to compete with other exporters of lumber wherever they send it, and to place a duty on the export of the material would result in handicapping them, and crippling the business and the export trade of the country.

The idea of the *Star* is to build up on this side of the line factories for making sash, doors, etc., but it leaves out of account the trade done with other countries besides the United States, and does not stop to consider that, in giving protectection to sash and door factories, it would not exclude foreign manufacturers from our own country—the powerful argument of the protectionist—but would cripple or extinguish an extensive industry already existing in the country with the hope of creating another.

It is not probable that the suggestion made by the *Star* will be further urged. It would not be a wise policy, and that fact is so easily seen that it will fall to the ground.

STRIKES AND THE LUMBER TRADE.

The present unsettled condition of affairs in the building trades in Boston, says the *Commercial Bulletin*, has naturally powerfully affected the lumber business, the prosperity of which is dependent upon the building business. At the opening of the season the prospects for a large demand for lumber were very bright, as there promised to be a very active building business. The improved outlook for general trade appeared to have effected real estate owners and operators very favorably, and the architects were kept busy with enquires and orders. The permits for building taken out for the first few months of this year were considerably in excess of those for last year. * * * There would have been a considerable amount of tearing down and rebuilding in the business district also. The prospects for the erection of small and medium class dwelling houses in the suburbs and suburban towns were good.

The lumber dealers, wholesale and retail, thus looked for an excellent business in this market and at profitable rates. This latter expectation was based upon the fact that the cut of pine and spruce in New England, and of pine in the west, would only be of average proportions at the most. The cut and supply of hardwoods was placed at only an average amount also, and as the prices of southern pine were down to a very low level, only a change in the direction of higher figures was expected. The prospects of a strike on May 1st by the builders's workmen for eight hours and an advance in wages put a much different face on the condition of affairs.

The buildings which were under way were hurried to completion, and no new work of importance was undertaken. The only exception was in the building of small and medium class dwelling houses. The men employed on this class of houses have generally not struck. The building of these houses has therefore been continued in the suburbs and suburban towns, and indeed all over the state. The lumber used is coarse lumber, that is New England lumber, principally spruce. For this there has been a good demand, particularly for framing stock, and the northern mills have been, and are now, well supplied with orders. The demand for laths, clapboards and shingles has not been as large as if general business was good, but it has been of very fair proportions, and prices have ruled high.

TIMBER CULTURE ADVOCATED.

The March number of *The Century* contained an article on "Timber Famine and a Forest School," from S. W. Powell, who said: "Savages live lavishly as long as their stock of food lasts, although they know they will have to starve afterwards. We say they can never climb out of savagery until they learn to save and to provide for coming want. Yet with respect to the forests—which are, no doubt, the most indispensible product of the soil—we have acted very much as the Comanche does with respect to his store of food.

"The value of our forest products is not less than $800 000,000 a year. Our sto e of white pine is rapidly approaching exhaustion, and other valuable species will be as ruthlessly wasted when the pine is gone. When the resulting timber famine comes, it will for several reasons be a more serious calamity than would be the failure for 10 consecutive years of any other of our crops.

"Failure, or even great scarcity, of working timber involves the derangement of total ruin to a vast number of important industries which wholly or in part depend upon the forest for their raw material. Some of these are metallurgy, building, wood-turning, tanning and the manufacture of articles made of leather, the making of wagons, carriages, furniture, Musical instruments, sewing-machines, etc. In short almost everything one uses needs wood directly or indirectly for its production.

"Destruction of the forest, especially upon steep hillsides, causes irregularity in rain fall and other climatic changes very harmful to agriculture, commerce, manufactures, and health besides the loss from floods, of which during the last few years we had such sad experience.

"But we shall never keep the hillsides wooded merely as preventive measure. We must learn to make timber culture in such localities profitable; and that can never be done without skilled labor and such professional training as the forest schools of Europe offord. * * * * We are rapidly nearing a terrible reckoning for the breach of natural law involved in our wasteful treatment of the woods.

"We have a great deal of second growth woodland which although it may be of value as a means of regulating climate and the flow of waters in springs and streams is producing very little of the timber which we are beginning so sorely to need. If we had a forest school, with a large tract of woodland under its case, it would be easy for farmers' sons to learn in a few weeks of observation, study, and practice how to do the pruning and thinning necessary to change these unsightly and nearly profitless wood-lots into rich and permanent sources of gain. If the proposed Adironback reservation is made, as it should be, to yield a large revenue instead of being a heavy and increasing burden and peril to the public, a thoroughly equipped forest school will be one of the first requisites."

PROTECTING CANADIAN LUMBERMEN.

A Detroit despatch to the New York *Times* says:—Lumbermen in the Saginaw valley section of the State are much exercised over the news from Ottawa, Ontario, that the Canadian Government has advanced the export duty on pine saw logs from $1 to $2 per 1,000 feet. The effect of this advance in the export duty will be to materially injure the saw mill industry of Eastern Michigan. Parties in this State own about 1,700,000,000 feet of pine timber in the Georgian bay district, the great bulk of which was purchased in the expectation of cutting the logs and shipping them to Alpena, Tawas, the Saginaw river and other ports for manufacture. The Emery Lumber Company alone owns 100,000,000 feet and cut last winter 55,000 pieces, scaling abou 15,000,000 feet, which it was expecting to bring to east Tawas and Saginaw this season. Ralph H. Loveland, of east Saginaw a member of the Emery Company, started for Toronto immediately upon the receipt of a despatch announcing the decision of the Minister of Customs, to look after his company's interests, and others will follow at once, Mayor Hill, of Saginaw City, among the number. It is, of course, generally conceded and the object of the Canadians is to prevent the exportation of saw logs to American points for manufacture, and compel Americans who have purchased timber limits in Canada to erect mills in Canada.

SPEED OF CIRCULAR SAWS.

It highly entertaining to run accross the estimates made years ago of the pine standing in Michigan, In 1869 the Hon. John F. Drigg, in "an elaborate and carefully prepared statement," put the figures at 15,000,000 000 feet less than there are standing to-day on the upper peninsula. Three years later C. B. Headley, considered to be well posted, went the honorable gentleman 2,000,000,000 better. Mr. Headley thought that the maximum cut in the Saginaw valley would be reached in 1873. By 1873 the production was 619,000,000 feat in round numbers, and in nearly 10 years of the prophesy the figures run up to 1,000,000,000. In 1872 Colonel Ben Wait said there were 43,000.000,000 feet of pine in the state. Since Mr. Wait set those figures as much pine has been cut in Michigan as he named, and doubtless, if asked he would reply that there is now standing nearly, if not quite, as much more. A dozen years ago Mr Wait was the most liberal estimator whose figures got into cold type, but as seen, even he was not liberal enough by 100 per cent.—*North Western Lumberman.*

CANADA ON STRIKE.

The Yankee fishermen are highly indignant because the Canadians are determined to protect their fisheries, and the Michigan lumbermen are highly indignant because the Canadian Government has placed an export duty on saw logs, which will necessitate the establishment of saw mills in Canada. The trouble with these Americans is that they have always been accustomed to think of Canadians as slow-going innocent country seople, easily imposed upon and willing to always remain hewers of wood and drawers of water for the Americans. They will soon understand that Canadians are wide-awake practical people, quite able to take care of themselves and that it takes more than an act of the United States Congress to decide any matter in which Canada is concerned. The right place for the saw mills is in the district where the lumber is cut. Northern Ontario is especially well provided with water power and there is no reason why mills should not be erected there as well as in Michigan.—*Montreal Star.*

PHOSPHATE AND LUMBER.

OTTAWA, June 4.—A deputation consisting of from fifteen to twenty phosphate and lumber merchants, headed by Mr. Alonzo Wright, M. P., waited on the Minister of Public Works this morning, in reference to the improvement of the River Lievre, or which a vote of $10,000 had just been made by Parliament. They showed to the Minister that the increase in the phosphate trade alone was over $1,500,000, and that the proposed lock and dam at Little Rapids, backing the water and rendering the river navigable up to the high falls, would be a great addition in the way of increasing the trade.

The Minister assured them that the intention of the Government was to benfit that trade as much as possible, and that a proof of that intention was given by the Government asking Parliament for the money voted. The plans and specifications would be immediately prepared and tenders invited.

HANDICAPPED.

Under existing regulations the lumber trade of this part of the Dominion is seriously handicapped. Besides the heavy timber dues now enforced, the export of dressed lumber to the other side is virtually paralized by the heavy duty imposed by the United States customs. According to the Canadian tariff, the duty on all kinds of lumber imported, rough or dressed, is $2 per thousand feet, whereas, if a Canadian firm ship dressed lumber to the States they have to pay at the rate of $6 per thousand, all lumber other than rough being tariffed as finished material. This state of things naturally tends to cripple the lumber industry and prevents competition, besides cutting out all labor of dressing lumber. Again, the high rate of rail way freight is ruinous to shippers.—*The Miner*

NATURAL SEEDING OF FORESTS.

It is unquestionably true that large areas in the Northern, Eastern and Middle Atlantic States, now almost destitute of trees, are better adapted to the growth of forests, and would yield a larger income to the owners if devoted to that purpose than to any other. The natural seeding of forests has an important bearing on this subject. To aid nature in this work is an easy way for its accomplishment. Nature is prolific in the abundance of seeds that she provides for the renewal of all the trees and plants, but she cannot unaided quickly sow the seed of the better kinds of timber trees over large tracts of land that have been stripped of seed-bearing trees, though some of the less valuable trees, like grey birches, are easily distributed over such tracts. John E. Hobbs, of North Berwick, speaking of the common belief in the rotation of hard and soft-wooded trees, and that one always follows the other naturally, says there is but little foundation in fact for this belief. This rotation often occurs and is effected in two ways: In one way by moving e ther of the varieties from a tract of land, which is afterwards seeded by the other variety that happens to be more favorably situated for doing it. In this way it is quite easy for a farmer to change the character of his forests, if when removing them he leaves such trees standing to reseed the land as he prefers for a subsequent growth. In the other way the rotation is caused by live stock. Cattle, sheep, horses and goats eat almost all varieties of young deciduous trees, and would prevent their growing when suffered to roam at large over the forest land. If live stock be left out of the question, the following may be given as the rule for the natural seeding of forests: Land from which a forest has been removed is reseeded by trees which are most favorably situated for furnishing the seed, unless it has been done with seed matured in the forest immediately before its removal, the wind being the chief agent in sowing the seed. When some forests of white pine trees are cut down a dense growth of the seed of the same kind of trees springs up at once, and when others are cut many years elapse before enough trees grow up to cover the ground. The tenacity of life of the seeds of the white pine, says Mr. Emerson, is remarkable. They will remain for many years unchanged in the ground, protected by the coolness and deep shade of the forest above them. But when the forest is removed and the warmth of the sun admitted, they immediately vegetate. A few pines scattered through a forest of deciduous trees fill the ground with seed, in a series of years, so completely that when the forest is cut down it not infrequently happens that a pine forest springs up its place. As some white pine forests are and others are not immediately renewed, it is possible that the seeds may not posses that tenacity of life which is claimed for them. Again, this difference in the time of renewal may be accounted for by the fact that the white pine does not mature seeds every year. In some years the mature cones in a white pine forest are very abundant. In other years there are scarcely any to be found. Therefore a forest which is cut down in the year when the cones are abundant is renewed at once, but if cut in the year when there are none or few to be found, the natural reseeding is either precluded or at least doubtful. This desirable result could have been effected if a sufficient number of seed-bearing trees had been left standing to reseed the land, and after it has been done these trees can be removed with benefit to the young growth, for young trees require the same advantages of air and sunshine as Indian corn, and grow much faster under full exposure than in the shade. Another authority states that the method of reseeding forests by leaving nurses standing over the area to be reseeded, though practical with modifications to several species of deciduous trees, has been almost entirely abandoned in Europe with the pine, on account of danger to the nurses through windfall, and of the injury done to the young growth by their removal. Instead of this, narrow strips are cleared and other strips are left standing by the side of the first, from which the reseeding is expected. This subject of natural seeding of forests under proper conditions furnishes a solution for a cheap method of covering certain sections of land with forest growth.—*Manufacturers' Gazette.*

THE QUEEN AND THE CANADIAN SECTION.

From the London. Eng., *Canadian* Gazette of May 27th we take the following notes regarding the Colonial Exhibition :—

The s.s. *Ulunda*, with 800 tons of exhibits from Canada, reached the London Docks on Tuesday last, and so excellent were the transport arrangements under the charge of Messrs. T and E. Kenny, that active work in the unpacking and arrangement in the various courts was possible as early as 4 a. m. on Thursday morning. The new exhibits comprise the Dominion Government's interesting ornithological collection to form part of the Natural History court; a variety of excellent photographs and pictures, which already add brilliancy to many portions of the Canadian section; silk and other textile fabrics of much merit; Canadian machinery of the famous Corliss tpye; and also considerable additions to the furniture, metal, educational, and agricultural exhibits, such as will,it is hoped, enable the Canadian section to assume a complete form in the course of the present week.

The commercial interests of Canada are already beginning to benefit by the display. During the past week very large orders are reported by various Canadian firms, including organs, spring matresses, and various manufactured goods. Representatives of the London School Board are among recent enquirers, with a view of large purchases of school desks, seats, appliances, while deputations with a similar object have come from as far north as Halifax in Yorkshire.

The Exhibition Conference Committee has drawn up a preliminary programme of papers to be read at the Exhibition during the season. Among the contributions we notice that those touching upon Canada will include one by Professor Fream on Canadian agriculture, and another by Prafessor Macoun on the botany and vegetable products of the Dominion, while Dr. Selwyn and Mr. Alexander Begg are also to read papers. Mr. Begg will treat of "The Great North-West."

The record of the Exhibition opened well in the way of numbers, and last week full sustained the high figures previously reached. In the course of the week as many as 140,533 passed the turnstiles. For the corresponding period, dated from the opening, in former exhibitions the official returns were: 1885, Inventions, 87,870; 1884, Health, 91,436; 1883, Fisheries, 74,871. A comparison of the totals at each exhibition in the period to date shows:—1886, Colonial, 386,111; 1885, Inventions, 255,110; 1884, Health, 209,596; 1883, Fisheries, 275,841.

On the morning of Friday last the Queen, accompanied by the Prince of Wales, Princess Beatrice, and the Duchess of Albany, visited the Canadian section in the course of an informal inspection of the Colonial portions of the Exhibition. Entering at the agricultural court from the West Indian section, the royal party was received by the Canadian Executive Commissioner and Lady Tupper. After presentation by the Prince of Wales, Lady Tupper handed to Her Majesty a bouquet of Marechal Niel roses, lillies, ferns and other flowers. Lady Tupper also took this opportunity to express great regret that circumstances had prevented the presentation to Her Majesty of the bouquet sent by the Montreal Horticultural Society. The Marquis of Lorne, who had previously been in the building, here joined the party, and presented Dr. Selwyn to Her Majesty. Both Queen and the Prince of Wales expressed admiration at the arrangement of the agricultural trophy, and evinced much interest in the display of fruits, grains and general agricultural products. Proceeding for a short distance down the south aisle of the central gallery, Her Majesty accompanied by the Prince of Wales, whose arm she took, made a detour through some of the Australian courts. On again entering the central Canadian gallery, from the South Australian portion of the central annex, attention was specially drawn by Sir Charles Tupper to the large map of the Dominion, and to the completed line of the Canadian Pacific—in the progress of which the Queen and her eldest son have been known to take a keen interest. Some time was then spent in an examination of the game trophy, special interest being excited by the Hubbard natural history collection, and by the fur exhibits of Messrs. Renfrew of Quebec, and of the Hudson Bay Company. Here Her Majesty was pleased to purchase an elegant lady's sable set from the exhibit of Messrs. Renfrew, and a silver fox skin from the Hudson Bay collection. Passing through the interior of the trophy, a handsomely framed photograph of Sir John Macdonald arrested attention, and Her Majesty expressed great satisfaction at the Canadian Premier's recovery from his recent illness. In the mineral court, which was next reached, the royal party much admired the agates from the head of Lake Superior comprised in Mr. Keefer's collection, the magnificent amethyst exhibited by the Executive Commissioner from Amethyst Island, and the specimen of gold from the Blue Nose lode belonging to the Nova Scotian Government. In the western gallery the machinery in motion claimed considerable notice, as well as the photographic views of the Windsor hotel and ice palace of Montreal prepared by Messrs. Notman of the same city. The educational court was next entered. In the Ontario portion Dr. May was in waiting, and reaching that allotted to the Province of Quebec, Lord Lorne presented the Hon. Mr. Ouimet, Superintendent of Public Instruction for the Province of Quebec, and Mr. Joseph Mannette, who is connected with the library collected by the Dominion Government. Her Majesty here noted with interest the evidences given by the exhibit of the great advance made during recent years in the education of the Dominion, and from this court entered the New Zealand section, expressing he great gratification at the parts of the Canadian display that had come within her notice.

It is estimated that there are three million feet of pine timber tributary to Thunder Bay, intersected by the Pigeon, Pine, Jarvis, Cloud, Carp, Slate, Sturgeon and Kaministiquia rivers. About three-fourths of this amount is white pine. W. H. Carpenter's limits embrace 25,000 acres of timber lands, of which there are 200 million feet of pine, and about the same amount of tamarac and spruce, cedar and poplar.

A "Pointer."

When Col. Sellers gives you a "pointer" in stocks, my friend, leave them severely alone, but when your own feelings tell you that you have palpitation of the heart, asthma, bronchitis or catarrh which unless checked are apt to run into consumption, heed the admonition before it is too late. All the diseases enumerated, and others, arise from impure blood. Put the liver in action, the largest gland in the human body, and you will speedily regain your lost health, and your bad feeling will disappear. Dr. Pierce's "Golden Medical Discovery" will accomplish the work speedily and certainly. Of your druggist.

J. D. Tully, druggist, will gladly inform anyone enquiring as to the wonderful merits of West's Pain King. The standard remedy for flox, dysentery, summer complaint, cholera morbus, cholera, colic, etc. Price 25 cents.

If any of our readers that are afflicted with rheumatism have never tried West's World's Wonder or Family Liniment, we advise them to do so at once, and be convinced of its extraordinary merits. It is a never-failing remedy for cuts, sprains, bruises and all complaints requiring external treatment. Price 25 cents and 50 cents per bottle. Sold by J. D. Tully.

BEWARE

OF WORTHLESS IMITATIONS

As there are many inferior goods, corded with jute, hemp, etc., offered and sold as Coraline by some unprincipled merchants trading on the reputation of our **genuine Coraline,** we warn the ladies against such imposition by drawing their attention to the necessity of seeing that the name

'CROMPTON CORSET CO.'

is stamped on inner side of all Coraline goods,

Without which none are genuine.

THE

SECURITY

MUTUAL

Benefit Society

OF NEW YORK,

No. 233 Broadway, New York.

The Security Mutual Benefit Society of New York is one of the few assessment life insurance companies that has attained conspicuous success. "Slow and Sure" has been the motto of its managers, and they have preferred to build up a solid foundation with

Strictly Frst-Class Male Risks,

rather than grow fast numerically at the expense of safety and become burdened with unsafe risks, heavy mortality and frequent assessments.

The members of this society elect their own officers annually, cannot be assessed except for death losses occurring after the surplus fund is exhausted, are guaranteed against dishonest management by the Agency Security and Guaranty Company, a responsible corporation organized upon the unlimited plan, and having one hundred thousand dollars capital, and who also

GUARANTEE THE PERPETUITY OF THE SOCIETY FOR 48 YEARS.

Considering the elements of safety and permanency which it affords, no organization ever before offered the substantial benefits of life insurance at so little cost to the insured.

ONLY TWELVE ASSESSMENTS

have been levied from 1881 to 1886, averaging three a year, and making the cost for assessments to a man of 40 years

Less Than Five Dollars a Year

for each $1,000 of insurance.

A GIFT Send 10 cents postage, and we will mail you *free* a royal, valuable, sample box of goods that will put you in the way of making *more money* at once than anything else in America. Both sexes of all ages can live at home and work in spare time, or all the time. Capital not required. We will start you. Immense pay for sure for those who start at once. Stinson Co., Portland, Maine.

WOOD POWDER.

Dynamite, so long used as an explosive in the engineer corps of the Belgian army, has lately, on account of the numerous difficulties attending its use, been replaced by wood powder, made at Canbille, near Peer, in the Province of Limburg.

The powder is simply sawdust, treated with a mixture of nitric and sulphuric acids, and afterward formed under powerful pressure into cylindrical or prismatic cartridges. These cartridges are prepared for commercial use by covering them with paraffined paper, which protects them from moisture.

The instantaneous production of the gases arising from the primer and the explosive, and the simultaneous action of these gases in every direction cause the air in contact with the face surface of the cartridge to act to some extent as a light tamping, and the power of the explosion is directed to the other face.

In comparative experiments made upon a rail with wood powder and dynamite with cellulose, it was ascertained that for equal weights charges of the first substance were at least as powerful in those of the second, and that the results were more constant, more regular.

In the experiments for rupturing double-T beams, the maximum effects were produced when the cartridges were placed in the angles upon one face of the beam.

Below are the results of the different experiments in the rupture of double-T beams of wrought iron, with equal weights of wood powder, of dynamite with cellulose, of gun cotton, and of paleine of 40 per cent. :

Nature of Explosives.	*Price per Kilo.....*	*Trials.....*	*Complete Rupture.....*	*Sufficient Rupture.....*	*Insufficient*
	Fcs				
Wood powder	3.50	10	8	2	....
Dynamite, with cellulose	4.50	8	4	1	3
Gun cotton	5.00	*5	1	....	3
Paleine	6.25	6	3	2	1

*One wholly failed to explode.

But it is especially with reference to transportation with an army that wood powder possesses remarkable advantages. It is well known what precautions are essential in order to protect dynamite cartridges in pack trains from projectiles which might strike them and cause explosion. With cartridges of wood powder this danger need not be feared, since when they are placed against iron plates, and struck by bullets fired a distance of fifty motres, they do not explode.—*Quarterly Journal.*.

THE AVERAGE LIFE OF BUILDINGS.

"How long does it take for a city to rebuild itself?" said the building inspector. "Well, that depends upon the progressiveness of the city. I should say about seventy-five years. That is the average life of a building nowadays. There are very few houses in this city that were standing seventy-five years ago. The old houses on north Capitol street, built by George Washington, are older than that, and there are other old buildings in the city. The Capitol s an old building, but I am speaking of private houses. The buildings erected by the Government, under careful supervision and at a great expense, of course, are more durable structures than those erected for private residences. The building which is being erected by Mr. Abell on F street will cost more per foot, I suppose, than most Government buildings. No, it may not be a good investment, but it is not being put up as an investment, it is a monument. The new State, War and Navy Department building is, however, just as well built as that That building will be standing a thousand years hence. It may, of course, need some repairs befor that time, and roof, of course, may have to be rebuilt. No material or work is allowed to go into these buildings unless it is up to the standard. The army engineers who have charge are very strict. Of course a private individual would not put up such a building. It would not pay. Yes, good brick ought to be as durable as stone. It depends a great deal upon the manner in which the bricks are laid Good mortar becomes harder with age. When dry bricks are laid during the warm months the brick will absorb all the strength of the mortar. Brick laid at such a time ought to be wet. A wall erected in April or May or October and November of sufficient thickness, ought to last for two or three centuries."—*Washington Star.*

THE LATE H. B. RATHBUN.

The Belleville *Intelligencer* of June 1st says :—The sad tidings of the death of Mr H. B. Rathbun, of Deseronto, reached Belleville this morning. Mr. Rathbun has been in ill health for some time past. Last winter he went to California for the benefit of his health. From California he took a tour through the Southern States and returned home but a short time ago. He found rest this morning about 4 o'clock. The deceased was born at Auburn, N. Y., and was 74 years of age. He came to Canada in 1854 and located at what was then called Mill Point, but is now known as Deseronto. At the time of his arrival the place had but one house. He began lumbering operations and from modest beginnings gradually extended his business until the name of Rathbun became a symbol of solidity and integrity throughout the Dominion and the adjacent states of the neighboring Republic. Through his thrift and enterprise Deseronto has developed from what it was when he found it to a thriving village of upwards of 3,000 persons. The operations of the Rathbun company have become so extended that to-day they have branches in Napanee, Picton, Belleville, Gananoque, Toronto, Oswego, Albany, New York, Liverpool and Glasgow All these agencies are supplied from the mammoth works at Deseronto, which are the back bone of the place. Besides these large lumbering operations there has been equipped a small fleet of bay steamers, a railway into the back country, a shipyard, a large flouring mill, and innumerable minor undertakings, all the out growth of his early enterprise and the energy and ability of his son E. W. Rathbun. Some twenty years ago the deceased retired from active business pursuits and surrendered the management of his vast business interests to his four sons, the eldest of whom is Mr. E. W. Rathbun. The result has proven that the son is worthy of his sire.

The late Mr. Schuster, the City Missionary, had a staunch supporter in the deceased, who recognized the good work that was being done, and encouraged it with his ample means. A family of four sons and three daughters survive him.

FORESTS AND FIRES.

In the Quebec Provincial Legislature on May 31st, Mr. Poupore moved for all correspondence respecting the enforcement of Vic. 46. respecting the sale and management of timber on public lands. Mr. Poupore stated that a large quantity of pine and other valuable timber was annually destroyed by people recklessly setting fire to it all seasons of the year. He trusted that the government would enforce the act and inaugurate a system to protect our forest reserves. He suggested to the Commissioner of Crown Lands that the limit holders should be charged a certain fee to aid a fund to establish a force of men to protect the forests from reckless people. He expressed the opinion of the lumbermen of the province to pay this fee. He did not wish to be considered as opposed to colonization, but his object was to protect the timber from reckless squatters, as distinguished from *bona fide* settlers. The squatters went on the ground in lumber regions, started taverns, and to clear a few acres in the spring they set fire to the timber and burned a million dollar's worth of valuable property. He hoped the Government would amend the law to prevent this state of things. The timber trade was one of the most important scources of revenue to the province and as a practical lumberman he would wish to see the law enforced.

Hon. Mr. Lynch said he had no objection to bringing down the correspondence if Mr. Poupore would also ask for the orders-in council respecting the enforcement of this law. He felt the great importance of doing everything possible to protect the timber reserves of the province It was a question on which the future prosperity of our province depended, and its importance could not be over-estimated. The province of Quebec has been especially blessed by nature with a wealth of soil, of timber and of minerals, all of which are capable of vast development It is the desire of the Government to in every way promote immigration and colonization in suitable districts, but they did not ask a man to settle in a district which did not offer every advantage to himself and children. He was greatly pleased with the remark made by the Lieutenant-Governor on Arbor day when his Honor said that they should place the settlers on the land which offered the fullest advantage to them and preserve the forest limits, so they might be found more valuable and more useful a hundred years from to-day. He could look back with pleasure to the fact that this law which divided the lands into lands for settlement and forest reserves had been placed on the statue book by him. He regretted that his invitation to the lumbermen of the province to assist him in carrying out his law had met with a poor response. He was, however, prepared to go so far as to make the lumbermen contribute to the protection of the forests assessing a fee on them.

After similar remarks from Dr. Duhamel the motion, as amended by Hon. Mr. Lynch, was agreed to.

A UNITED STATES VIEW

The Bay City *Lumberman's Gazette* says: William Little, of Montreal, advocates the increase of the export duty on logs from Canada to $4 per thousand feet, $2 to counterbalance the United States duty on lumber and $2 more for national protection. He says, in order to foster Canadian manufactures, it would be best to have a rate of export duty almost prohibitory, but he would not propose that. Michigan mill men who are arranging to import logs from the Dominion ought to feel grateful to Mr. Little for not advocating a prohibitory rate and proposing only a mere pittance of $4. With that rate of export tax the Canadians would keep their logs at home by a large majority. If the Canadians want the timber more than they want American money, and the development of their country, they should follow Mr. Little's advice. The money which being invested in timber limits in Canada would have been put into Southern timber lands and saw mills in the south, the duty on lumber imported into the United States would be retained, and Canada would be left to the slow growth of the past. If her forests in their primitive condition are of such great value in themselves and she desires to retain them intact, she can do so by imposing such an export duty on logs as Mr. Little recommends. With any greater rate of duty than is now imposed Canadian logs will not be brought to Michigan for sawing nor will Canadian lumber be in much demand, while southern pine lands are obtainable at $1.25 to $2.50 per acre. Southern pine is calculated to take the place of Canadian lumber in the American market and all that is needed to enable it to do so is the greater development of the industry and an improvement in railroad enterprise in the south.

OUR TIMBER SUPPLY.

Hon. Mr Carling's scheme to establish experimental stations this summer will not come into operation permaturely. Among the things which it proposes to deal with in forestry, and while the usefulness of experiments in that direction are primarily intended to benefit the prairie Provinces of the Dominion, they must before many years have passed be acted upon in the older sections of the country. It is true we have an abundance of timber just now ; but the foreign demand is increasing and the value of our forest possessions are rapidly being exchanged. They must before long become of enormous value. A glance over the geography of the world shows that but one other country possesses so large an area of Forests as Canada, and that country is Russia. At the present rate of consumption the United States, with 16 000 saw mills, has but twenty seven year's supply, outside of private possessions, and the trade now springing up with that country is but the beginning of what must become a very great branch of our foreign commerce in a few more years. The planting of hardwood trees on land not otherwise very useful cannot be begun too soon. France since 1848 has converted nine millions of her waste acres into forest, and the wisdom of that course is now abundantly demonstrated. Each acre, which before being planted with trees produced about $175 annually, is now valued at over $600 The people of Canada, when they have looked into this matter, will see the propriety of taking any proper steps which have for object the development of forestry. There's millions in it.—*London Free Press.*

SERIOUS BUSH FIRES.

The Nipissing *Times*, published at North Bay, says :—The bush fire which was referred to when going to press last week, originated about a half a mile above the village. A northwest wind was blowing at the time, which caused the fire to make rapid headway towards the village. The hose, not being of sufficient length, was useless. A large number of the villagers and men from the C. P. R shops, hastened with pails and axes to stop the progress of the flames, which would in a short time have got beyond their control. Water was conveyed to the spot by locomotives. After two hours hard labor the progress of the fire was checked.

The Renfrew *Mercury* says :—After the long continued dry weather, bush fires in many parts of the country became alarmingly dangerous last week. At North Bay the village bell was kept ringing continually on account of the fires in the vicinity. At Renfrew, a fire spread from Mr. J. Murphy's farm at the Pinnacle, through Mr. E. Mayhew's limits, which were entirely devastated of a fine growth of young pine, and the fences burned down, and then on to Mr. Ward's property, where it also destroyed a considerable portion of fencing and menaced the barn. A number of friends from the village went out to assist in fighting back the flames and succeeded. Many of them were laid up next day—Sunday. Mr. Murphy's bush was also destroyed. The fire through Mr. Mayhew's property caused a great commotion among a lot of partridges. On Saturday morning the Wilberforce side of Eganville had a narrow escape from destruction also. A slight change in the wind fortunately averted the disaster. Boys had carelessly started a fire.

About two weeks ago says the Eganville *Enterprise*, set out fires in the vicinity of Pogue Lake, says a man just down from the woods, and the high winds which prevailed since that time have carried the fire down to Brennan's creek, a distance of over ten miles, the breadth of the burnt district being over three miles. Mohr's limit suffered greates, the fire totally destroying it. McLachlin Bros.' limit caught in several places, burning all the provisions the men had for the drive. On Saturday during the high wind the barns and outbuildings on the farm of Mr. Stephen Ryan, Reeve of South Algoma, took fire from the bush and were totally destroyed. A number of settlers in South Algoma and Hagarty have had their fences and crops burnt On Saturday evening they had a good shower of rain, and only for this a good deal more damage would have been done. The Polish settlers were removing their furniture and effects from their houses and burying them, but the timely rain saved their buildings.

A Russian Pole was arrested at the instance of McLachlin Bros. and brought before Justices Kinders and O'Grady, charged with setting fires to their limits, and was by them committed to goal for thirty days.

BEATTY'S wharf, house and dock and the Parry Sound Lumber Company's storehouse, at Parry Sound, containing a quantity of flour, oats, etc., were destroyed by fire on May 29th. A strong wind placed the lumber yards of the Parry Sound company in jeopardy, but strenous exeretions on the part of the employees saved the property. Loss covered by the insurance.

W. C. RANSOM, deputy commissioner of railroads in Michigan, estimates that there will be 390 miles of new road constructed in that state this year.

FORESTS FOR FOREIGNERS.

A MEASURE for the public good can rarely be adopted without causing inconvenience to somebody. It appears that the very judicious and beneficial action of the Dominion Government in increasing the export duty on saw logs is no exception to this general rule. The *Globe* constitutes itself the advocate of these sufferers, and in an editorial article zealously urges their cause. Its clients are two bodies with somewhat different, though allied interests, being the saw mill men of the United States, and Mr. Mowat and his colleagues.

We are informed by the *Globe* on behalf of the foreign interest that "mill-owners from the United States have lately purchased large timber limits on the North Shore of Lake Huron, &c.," that these men will consider the increased export duty a fraud upon them, and may, therefore, induce their Government to retaliate. The country will not agree with the *Globe* in prefering the interests of these foreigners to those of Canadians. Why should our saw mills be closed, or in newer districts remain unbuilt, in order that foreign mill-owners may secure the profit and foreign mill hands earn the wages gained by the conversion of our saw logs into lumber? As to fraud, the idea is absurd, for it is no oppressive duty, but merely a reasonable measure to redress the unfairness of the imposition of a duty on Canadian lumber taken into the States, while their lumbermen wish to obtain our logs free. Now that our neighbors have made preparations to carry on these operations on a larger scale, it has become necessary to redress this inequality so unfair to our country. The cry for retaliation is just as unfounded, for it is Canada that is simply protecting itself by meeting an unfair discrimination, and putting matters on an equality. The *Globe* occasionally pretends to have an especially friendly feeling for the Canadian "workingmen." In its course in this matter we have another proof of its impudent hypocrisy in this claim. Now, as always, it prefers the interests of foreign workingmen to those of Canada. It is bitterly aggrieved because this means has been taken to prevent the workingmen in the United States saw mills from snatching from Canadian workingmen in Canadian saw mills the profit of turning Canadian saw logs into lumber.

The case on behalf of Mr. Mowat and his colleagues, as put by the *Globe*, is no stronger. It is not to be desired that facilities should be afforded them of stripping Canadians of the profits of manufacturing lumber in favour of foreigners, merely to assist Mr. Mowat to obtain money from those foreigners to satisfy the greed of his followers, and enable him to keep up his extravagant expenditure out of capital. If the raised export duty has the effect of putting some check upon such wasteful sales this will be only an additional benefit derived from it. It is well that the property of Ontario should not be sacrificed by such improvident sales, and it is also well that the Adminstration should not be encouraged in extravagance by having the easy expedient of selling some more of the Provincial real estate whenever it cannot make both ends meet out of current revenue. When there is a demand for our more distant timber to convert into lumber there will be a sale for it, and it is only an improvident policy to force premature sales. This is especially the case when our property is thus sacrificed on the worst possible conditions, netting us merely the bare purchase money and dues, making an inroad on our natural resources, taking from our own people the advantage to be derived from the trade, and conferring all its benefits upon foreigners. An additional light is thrown upon the impolicy of such sacrifice sales, when we reflect that some of these purchasers from the United States have possession in their own country of timber lands which they are avowedly holding in reserve for the inevitable future rise in prices, and they are buying our timber expressly to hold backtheir own until our available forests are exhausted. Why should Ontario thus play into their hands, instead of securing for itself the benefit of such rising values?

While we cannot agree with the *Globe* in its advocacy of the claims of its foreign and domestic clients, we must congratulate it on the terse truthfulness with which the tenor of its editorial is described in its heading "INVITING RETALIATION AGAIN." This is precisely the *Globe's* position in this article. It is a deliberate appeal to the United States to inflict some injury on Canada, under the pretence that it is a fraud for Canada to protest its property, its industries and its working men from unfair and onesided conditions. The *Globe* can never forgive Canada for being Conservative and for refusing to entrust the management of its affairs to the *Globe* and its friends. Therefore it welcomes and sympathises with any ally that is opposed to Canada and its people. It makes a hero of Riel and his fellow rebels and murderers because they fought against the authorities of Canada and killed loyal Canadians. So in commercial contests it always takes the side of foreign manufacturers and foreign workingmen against Canadian manufacturers and Canadian workingmen. It is therefore only consistent in its present invitation to the United States to inflict some injury on Canada under the false pretence of retaliation.—*Peterborough Review.*

EXPORT DUTY ON SAW LOGS.

THE raising of the export duties on logs s a wise step and will meet with general approbation. Our Finance Minister has proposed and carried a resolution to increase these duties to the following amounts:—pine logs $3 per thousand, spruce logs $2 per thousand, and shingle bolts $1.50 per cord. This will do away with a crying evil. It is bad enough that our forests should be so rapidly exhausted even though our own lumbermen were deriving a profit from the operation. But it was much worse to see our land stript of our forest wealth to enrich foreign mill-owners while the owners of our own saw mills lost the profit. And there were evident preparations for this being carried on henceforth on a gigantic scale. Lumbermen from the States have made enormous purchases of limits, and there was no attempt to conceal the policy that was being adopted of looking to Canada for logs.

As to the difficulty that has been suggested of collecting these duties, a few seizures will settle that question, for saw logs cannot be easily smuggled.— *Peterborough Review.*

Health is Wealth!

Dr. E. C. West's Nerve and Brain Treatment guaranteed specific for Hysteria. Dizziness Convulsions, Fits, Nervous Neuralgia, Headache, Nervous Prostration caused by the use of alcohol or tobacco, Wakefulness. Mental Depression, Softening of the Brain resulting in Insanity, and leading to misery, decay and death, Premature Old Age. One box will cure recent cases. Each box contains one month's treatment. One dollar a box, or six boxes for five dollars; sent by mail prepaid on reseipt of price. We guarantee six boxes to cure any case. With each order received by us for six boxes, accompanied with five dollars, we will send the purchaser our written guarantee to refund the money if the treatment does no effect a cure. Constipation

Causes, directly or indirectly, fully one-half the sufferings which afflict mankind. It is usually induced by inactivity of the liver, and may be cured by the use of Ayer's Pills. C. A. Schomerus, Great Bend, Kansas, writes: "I have used Ayer's Pills for Costiveness, with the most beneficial results." J. Windholm, Newark, N. J., writes: "Ayer's Pills cured me of chronic Constipation." Martin Koch, Huntington, Ind., writes: "Last year I suffered much from Biliousness

And Headache

After using one box of Ayer's Pills I was quite well." C. F. Hopkins, Nevada City, Mo., writes: "I have used Ayer's Pills, and think they are the best in the world. They have cured me of Sick Headache and Neuralgia." W. L. Page, Richmond, Va., writes: "I have been a severe sufferer from Headache. Ayer's Pills afford me speedy relief." A. J. Forster, Dauphin st., Mobile, Ala., writes: "For a number of years I have been troubled with Constipation and Headaches. After trying a number of so-called Liver Invigorators, without benefit, I was at last

Cured by Using

Ayer's Pills." Rev. Francis B. Harlowe, Atlanta, Ga., writes: "For years I was subject to Constipation, from which I suffered increasing inconvenience, in spite of the use of medicines of various kinds. Some months ago, I began taking Ayer's Pills. They have entirely corrected the costive habit, and have vastly improved my general health." Hermann Bringhoff, jewelry engraver, Newark, N. J., writes, "Costiveness, induced by my sedentary habits of life, at one time became chronic and exceedingly troublesome. Ayer's Pills afforded me speedy relief, and their occasional use has since kept me all right." Ed. O. Easterly, Rockford, Ill., writes that he has been cured of chronic Constipation by the use of

Ayer's Pills.

Market Reports.

TORONTO.

From Our Own Correspondent.

JUNE 9.—Another large tow of lumber left our docks this morning, consisting of over 1,500,000 feet, via Ogdensburg for Boston, and the docks are nearly clear of lumber, and at all the mills north of here there are nearly clear mill yards leaving ample room for piling this season's cut. It is generally conceded that bill lumber must soon take a step upward. There are two potent reasons for this belief: 1st, the fact that last years cut is cleared out, or nearly so. 2nd, quite a number of mills that run on bill stuff last season, are this year cutting stocks for shipment to the American side, and trade with the western part of our province increases yearly. The small mills in the west for many years past furnished considerable lumber for home use, but that is now a thing of the past. Trade here also continues brisk, all the yards keep fully employed, but the two first reasons given are sufficient to warrant the belief that dimension stuff, cut to order, must advance before the season closes.

Our wholesale lumbermen have at last come to the conclusion that unless they were willing to have their last dollar filched from their pockets by the railroad companies, that they must be up and doing, consequently a deputation of the prominent dealers left here this evening for Montreal, to place their grievances before the heads of the G. T. and C. P. railroad companies. The universal opinion held by all our lumbermen is that lumber should be carried by the M feet and not by weight. All dealers would then know exactly where they stood. At the present time they frequently sell cars at less than cost, after the excess freight has been deducted. In addition to this the new orders issued from day to day by the N. & N. W. R. R. are so vexatious in their character that lumbermen are fairly sick of the whole business. It really seems as if the present management was determined to strangle the ntire lumber traffic by all possible means in their power. It is true that there is a certain portion of the lumber cut that must come over their line, but there is also large cut that will take the water routes this season that would otherwise of passed over their rails. If the present manager is satisfied that his road will have all they can do well and good; if not, he is guilty in pursuing such a suicidal policy, time will tell. Lumbermen will, however, resist to the utmost any attempts at collecting excessive charges such as that now demanded. Railroad companies must be made to understand that they are amendable to the same laws that govern other common carriers. Where is the common sense or justice in saying, if you load on 20,000 pounds of lumber on our cars we will charge you for carrying 24,000 pounds, and if your load on 28,000 pounds we will charge you on that weight and 25 per cent. additional on 4,000 pounds. It is so absurd in its character that it will not bear one moments discussion, and if any other class of men except railroad managers were to attempt to perpetrate such a gouge, four prison walls would be thought by most people the most fitting place to enclose them, and it will be to the ultimate advantage of all roads governed by such men to remember that there is a limit to the endurance of even lumbermen.

WOOD-WORKING PATENTS.

The following list of patents relating to the wood-working interests, granted by the United States Patent Office, June 1st, 1886, is specially reported by Franklyn H. Hough, solicitor of American and Foreign patents, 925 F. Street, N. W., Washington, D. C., who will furnish copies of patents for 25 cents each:

342,939— Lumber cutting machine —H. S. Smith, Brooklyn, N. Y.

343,096— Saw, drag—W. H. Yagel, Deer Lick, Ohio.

342,918—Saw mills, transfer apparstus for—G. W. Loggie, Portland, Oregon.

342,057—Sawing machine feed table—D. J. Murray, Warsaw, Wis.

PATENTS ISSUED JUNE 8.

343,411— Chuck, lathe— J. H. Westcott, Oneida, N. Y.

343,443—Lathes, beading attachment for—N. A. Dickinson, Chester, Conn.

343,217—Mortising and boring machine—H. A. Axtell, Montague, Mass.

342,457— Saw mill feed mechanism —H. I. Hipp, Columbia, S. C.

343,254—Saw, hand—C. Richardson, Newark, N. J.

343,358—Saw tempering apparatus—W. B. Barry, Indianapolis, Ind.

343,203—Saws, device for jointing circular—K. Shives, Dunsinane, New Brunswick, Canada.

CHICAGO.

The *Northwestern Lumberman* of June 5th says:—Receipts this week were quite liberal. The Monday morning fleet was thought to have been the largest that had been seen on the market this season. Every day since Monday there has been a fair number of offerings. While the market has not shown great activity, the cargoes for sale have gone off with reasonable celerity. The yard men still hold a little aloof, and purchase only after considerable talk and hammering, an attitude that prevents a quick market. Yet prices have been fairly maintained at about former figures. If short, green piece stuff has been sold below $9.25 for decent cargoes, nobody will acknowledge it. Dry dimension is worth from $10 to $10.50, according to composition of cargo as to quality and length. The greatest inquiry is for green dimension. Boards and strips are not so urgently required, as prices are thought now to be too high to warrant heavy purchases.

Shingles are quoted five cents a thousand lower than they were last week, though commission men deny that there has been any decline. The yard dealers, however, assert to the contrary. Since the market is described as more active than last week, it is likely that sufficient concession has been made to stimulate buying.

The market as a whole may be described as moderately alive, with prices held up by main strength on the part of the commission men. Even this would not suffice if the manufacturers should load the market with a rush of cargoes. But the policy this season will probably be like that of last year—shipments will be gauged by the urgency of demand.

The following list represents the range of prevailing prices:—

Dimension, short green	$ 9 25
" " dry	10 00@10 50
Boards and strips, No. 2	10 50@12 00
" " " medium	13 00@15 00

" " extra	2 00
Lath, green	1 25
Lath, dry	1 40

Just now the yard men are discussing questions of trade with much interest, because they cannot see how they are to put in stock and keep business moving when there is so little margin between cargo and yard prices. The chief interest now centres in cargo and millyard values. Nothing more than a steady summer trade is expected from now until August. All realize that the late labor disturbance gave a stunning blow to the spring and early summer trade, and have given up the idea that there can be an extraordinary trade this season. What concerns the dealers now is to know how to put in such stock as they require for the fall trade without danger of losing money. They insist that cargo prices must go down, or they will buy but sparingly. Prices have weakened within the past few days, but they screw down hard, with little indication of a break. It is likely that the experience of last year will be repeated.

Prices will be yielded just enough to work off the offerings, and no more. In this way the yards will be gradually stocked up, and in the fall it will be found that the cargo market has been held steadily all the season, while the yard men have gained no great advantages in their purchases.

These has been no marked change in yard prices within the week. Individual yards are making prices to suit the stocks and financial conditions of each. The price list is little regarded in making sales of lumber above the common grades. Dimension that is dry enough to ship is held with tolerable firmness. Wide inch lumber is also fair property, at steady prices. But strips, from C upward, and the most of high grade lumber, is selling slowly, and prices are made to the customer that will induce him to take the lumber.

The trade in good lumber has taken a peculiar turn this year. The large relative inquiry for it last season, and the apparent short supply of it, induced nearly every dealer to search for and procure an unusual supply. Yards that had been in the habit of carrying but little good lumber, laid in all that could be bought last season. The result was that the trade was loaded down with good lumber, though probably much of it was not well graded, and was less saleable on that account. Every holder imbibed the idea that he must realize larger profits on his choice stock, in order to make up for his losses on the cheaper classes. But to his chagrin he has found that the demand has not been equal to the supply. Manufacturers and housebuilders have called for cheaper lumber than ever. Sash and door makers have been forced to buy cheaper lumber to meet the competition of low prices. It has thus been found that there is a limit to the demand.

Some yards, the business of which is largely local, report a good trade. Yards that supply the builders of the smaller class of structures in the city and suburbs, are having a better trade than the yards that look for heavy contracts. The reason for this is obvious. The labor troubles checked the building of large structures, while the building and repair of small houses was not seriously affected. Within the past week there has been a marked increase in the number of building permits issued. Permits for several large buildings have been issued within the past three days, showing that confidence among investors and contractors is becoming restored.

Receipts of lumber and shingles for the week ending June 3rd, as reported by the Lumberman's Exchange:—

LONDON.

The *Timber Trades Journal* of May 29th says:—We cannot chronicle any change whatever either in the London or coast markets, and business continues unusually restricted even for the present time of year, which is generally one of the quietest seasons as far as f.o.b. sales are concerned. A few contracts have certainly been made, but buyers as a whole remain quite indifferent, while many sellers, finding no good results from forcing sales, seem inclined to abstain from pressing their makes. We think ourselves that the inland trade would brisker were not that the fear of an impending dissolution of Parliament leads buyers to confine their dealings within the narrowest possible limits. It is generally thought that we shall, before long, find ourselves in the midst of another election, with all its accompanying disorganizing influences on trade.

A few weeks back there were some slight signs of an improvement in the Midland districts, but the indications have disappeared completely during the past ten days.

There was by no means a bad room at Messrs. Churchill & Sim's sale on Thursday, especially considering the limited nature of the reserved lots and the counter-attractions down Epsom way. This latter undoubtedly had its influence, as we noted the absence of one or two leading firms from their accustomed places in the vicinity of the auctioneer's desk. Prices ruled low throughout, though here and there a lot really wanted fetched pretty fair values.

The great falling off in the consumption is getting very serious, and till we see some amendment in this quarter we cannot hope for a recovery in prices. There are reports about that several heavy sales have been made lately, but there is nothing to corroborate them in the deliveries from the docks.

The weather this month has not favored the building trade, and a worse time for carcasing we cannot well remember. The rainfall extending over Friday, Saturday and Sunday is almost unexampled, and must do a considerable amount of damage to the crops in loose soil, all the low-lying lands being flooded. "A moist May and dry June keeps everything in tune," says the adage, but we question if the oldest inhabitant can recollect a wetter May than that which is now near its termination.

The deliveries from the docks can hardly be very good while such a state of things continues. The depression of trade was bad enough before, but we must look for the effects of the rain on the consumption in an aggravated form the forthcoming week.

That things, however, are not quite as bad as they seem if evident from the large quantity of goods placed. The wonder is that, after three months of an unusually severe winter, free-on board prices have kept up as they have done. At any rate, there is a big business still being carried on. The weather has been just the reverse of favorable to consumers, yet even at the public sales good stocks hold comparatively steady. If the decline in prices is still noticeable, it cannot be so easily perceived on the better descriptions, which, were it not for the exceptional state of the market, would soon show an upward tendency.

LIVERPOOL.

The *Timber Trades Journal* of May 29th says:—The arrivals of timber laden vessels during the week past have been very few and unimportant; consequently the docks and quays have worn day after day, a bare and uninteresting appearance.

Bad as this may be from some points of view, it is not greatly to be regretted, for, evidently, the more the import for the coming season may be curtailed, the better for the trade generally, as the demand from the country and the wants of the local districts are apparently of the most limited character.

Perhaps some part of this apathetic state may be traced to the fact that some buyers refrain from entering into their purchases until the arrival of the first shipments of fresh goods, and this is not now far distant; but at the same time it is to be feared that the present dead state of trade is traceable to other causes.

There is little change in the freight market, and although some amount of chartering has been done from Quebec to Liverpool, the quantity is below that of the usual average. The latest rate we have heard of is 19s. per load of timber to Liverpool.

We regret to say that another house engaged in this trade, near the Canada dock, have been compelled to suspend payment. A private meeting of the principal creditors was called a few days ago, and we hear another is to be held at the end of this week to consider the position. Probably an amicable arrangement will be arrived at without the intervention of the Court. Pending the result of the proposed meeting nothing further can be said on the subject.

TYNE.

The *Timber Trades Journal* of May 29th says:—There is a long list of arrivals during the last seven days, but amongst them there are no items of importance, with the exception of one cargo of teak from Bangkok and a cargo of timber from Pensacola. Pitch pine timber is largely held on the river at present, and is being now sold at lower rates than at any previous period. There is but little demand for it, and when an order is to be placed there appears to be little difficulty in buying on almost as favorable terms as merchants have imported. Pit-props are still a very slow sale, and prices show no signs of improvement. In trade generally the present is as dull as ever, and the outlook for the future is not at all inspiring. Shipbuilders are still very slack, and the various ironworks and colleries are apparently as dull as it is possible to be. So far there are no arrivals of Baltic deals, but a few ships are almost daily expected.

GLASGOW.

The *Timber Trades Journal* of May 29th says:—Imports at Glasgow for the past week include the first arrival this season of Canadian deals, viz., the parcel per steamer Norwegian, consisting chiefly of narrow first quality pine deals. They are being yarded at Yorkhill.

No auction sale of the new deals has yet been called.

At Greenock the only arrival to note is a cargo of teak timber, consigned to Messrs. Edmiston & Mitchells.

The import of teak to Clyde ports this year to date has been eight vessels, aggregate tonnage 6,075 tons.

There have been a good many launches from the Clyde shipyards within the past week; total over 6,000 tons. At the Point house ship yard Messrs. A. & J. Inglis are about to begin the construction of two steamers (their combined tonnage 1,600 tons) for the Carron Company; and Messrs. Barclay, Curle & Co., (Limited) have, it is stated, been entrusted with an order from Mr. John Burns to build a screw steamship, intended for the Irish trade of the Messrs. Burns.

A public sale of deals took place at Yorkhill, Glasgow, on 26th inst., Messers. Edmiston & Mitchells, brokers. The catalogue comprised Michigan 1st and 2nd pine deals and Shediac, N. B., spruce. There was a small attendance of buyers, and demand quiet; offers for the 1st quality not meeting brokers' views, these deals were withdrawn. The following were the prices realized:—

Michigan 2nd pine deals—	Per cub. ft.
16 ft. 16/24x3	2s. 4d.
14 ft. 10/27x3	2s. 2d.
Shediac, N. B., spruce deals—	
16/24 ft. 9x3	0s. 9½d.
15 ft. 8x3	0s. 8½d.

NEW YORK.

The following is the official list of the prices obtained at the New York Lumber Auction Company's sale at New York on June 8th:—

Lot —Ash bausters, 4570 pieces, 1½ cents each.

Lot 2—Whitewood, 1½ and 2 inch, firsts 7,100 ft. seconds, 4.196 ft.; culls 89 ft., $.. .0

Lot 3—Whitewood ¾ inch, firsts 4,00 f seconds, 3,386 ft.; culls, 146 ft, $23 00

Lot 4—Whitewood, ¾ inch, firsts, 4,'0 ft; seconds 3,663 ft.; culls, 171 ft. $

Lot 5—Whitewood, 2 inch, firsts 7,28 ft, seconds, 3,808 ft. $28.

Lot 6—Whitewood, ⅝ inch, wide, firsts, 1,895 ft.; seconds, 709 ft. $24.

Lot 7—Whitewood, ⅝ inch, firsts, 8,474 ft.; seconds, 6,329 ft.; culls, 345 ft. $22.

Lot 8—Whitewood, 1½, 2 and 2½ inch, firsts, 6,815 ft.; seconds, 1,518 ft.; culls, 184 ft. $32.50.

Lot 9—Whitewood, 1 inch, firsts, 4,850 ft.; seconds, 1,739 ft.; culls 145. $31.

Lot 10—Whitewood, 1 inch, firsts, 5,165 ft.; seconds, 1,537 ft.; culls, 91 ft. $33.

Lot 11—Whitewood, ⅝ inch, firsts, 2,130 ft.; seconds, 1,197 ft.; culls, 151 ft. $25.

Lot 12—Whitewood, 1 inch, culls, 13,084 ft. $16.

Lot 13—Ash, 1, 1¼, 1½ and 2 inch, firsts 2,640 ft.; seconds, 1,866 ft.; culls, 855 ft. $26.

Lot 14—Whitewood, 1 and 2 inch, seconds, 104 ft.; culls, 1,234 ft. $20.

Lot 15—Ash 1¼, 1½ and 2 inch, firsts, 3,729 ft. $26.

Lot 16—Ash, 1 inch, firsts 9,879 ft. $23.

Lot 17—Whitewood, 1 inch, firsts, 5,367 ft.; seconds, 6,393 ft.; culls, 84 ft. $26.

Lot 18—White pine shelving, ⅞ inch, s. 2 s. (wide) 5,533 ft. $26.

Lot 19—Ash and walnut balusters, 125, 1¼x1¼x32, 1 cent each. 11,640, 1½x1½x32, ¾ cent each. 6,150, 2x2x32, 1¼ cents each. 20, 3x3x33, 2 cents each. 100, 3x3x32, 2 cents each.

Lot 20—Whitewood, ⅝ inch, wide, firsts, 2,392 ft.; seconds, 1,558 ft. $24.

Lot 21—Whitewood, ⅞ inch, firsts, 7,695 ft.; seconds, 6,253 ft.; culls, 94 ft. $21.50.

Lot 22—Whitewood, 1½ and 2 inch, firsts, 6,400 ft.; seconds, 3,832 ft.; culls, 116 ft. $28.

Lot 23—Whitewood, 1 inch, firsts, 7,018 ft.; seconds, 4,673 ft. $26.

Lot 24—Whitewood, 1 inch, firsts, 6,359 ft.; seconds, 5,289 ft.; culls, 192 ft. $26.

Lot 26—Whitewood, 1 inch, firsts, 8,535 ft.; seconds, 6,252 ft.; culls, 315 ft. $30.

Lot 27—Whitewood, 2 inch, firsts, 6,174 ft.; seconds, 4,576 ft.; culls, 403 ft. $26.50.

Lot 28—Whitewood, 1¼ and 1½ inch, firsts, 2,394 ft.; seconds, 1,820 ft.; culls, 116 ft. $27.50.

Lot 29—Whitewood, 3 inch, firsts, 788 ft.; seconds, 3,306 ft.; culls, 3,204 ft. $22.

FOR THE

Canada Lumberman

IT WILL PAY YOU, Because :

1. It is the only newspaper published in the Dominion of Canada devoted to the lumber and timber industries.
2. It is devoted to the development and utilization of our forest wealth.
3. It furnishes complete and reliable quotations of prices of lumber in all the leading markets.
4. Its columns are filled with interesting reading matter, valuable alike to the land owner, manufacturer or dealer.
5. It costs only $2.00 per year to have it sent, post-paid, to any address in Canada, and no land owner, lumber dealer, manufacturer or individual in any way connected with timber industries, can afford to do without it.

☞TO ADVERTISERS.

It has a circulation among saw mill owners, manufacturers, lumber and timber dealers and all classes connected with the timber business.

Examine the field, count the cost, and you will at once decide that the CANADA LUMBERMAN is the

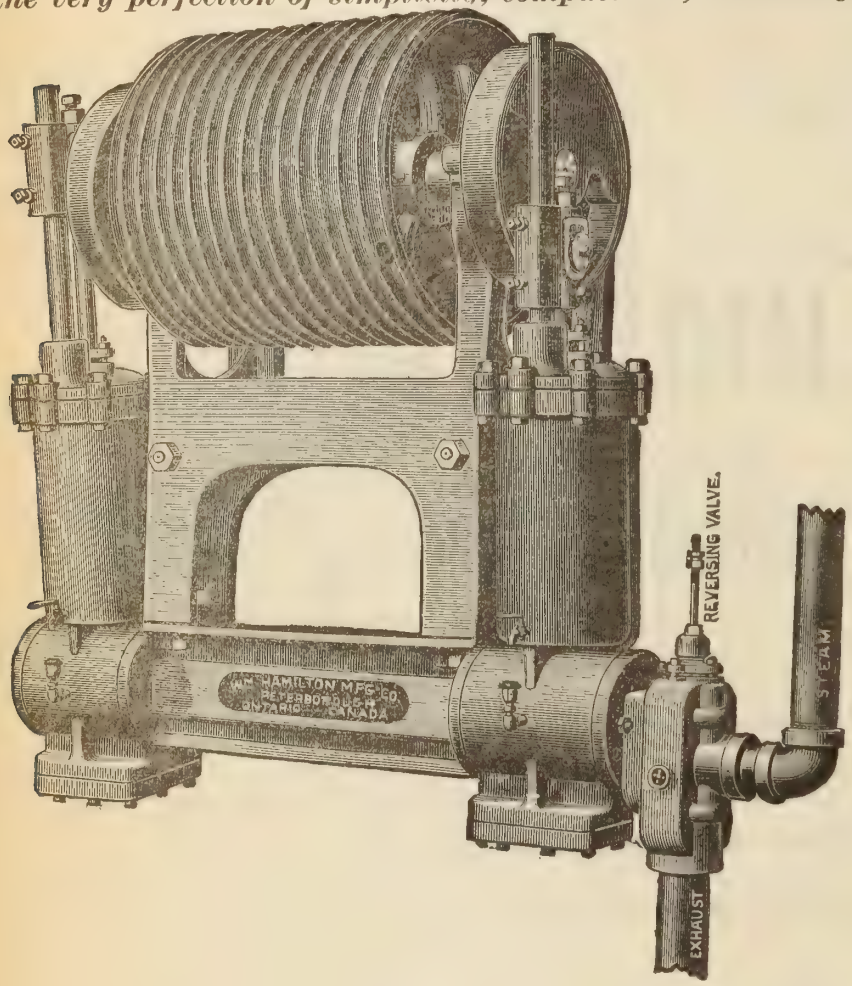
———CHEAPEST, BEST, MOST RELIABLE and ONLY TRUE MEDIUM———

for placing your goods or wares before the saw-mill men and lumber and timber dealers of the Dominion.

CUNNINGHAM'S
PATENT OSCILLATING TWIN ENGINE

FOR STEAM FEED IN CIRCULAR MILLS WITH RACK OR ROPE.

This Engine has practically but two moving parts, aside from cranks and shafts. The whole array of eccentrics, valves, valve rods, connecting rods, cross heads, slides, levers, rock shafts, bell cranks, etc., is done away with, and the very perfection of simplicity, compactness, durability and cheapness attained.



The above engraving illustrates the Twin Engine, 10x16, for Rope Feed, for Saw Mill Carriages. The spool is 27 in. diameter, 30 in. face, is grooved 2 in. pitch for 1½ in. rope. The shaft is steel, 4½ in. diameter, with disk cranks. No connecting rods, eccentrics or valve rods to get loose and out of order. The ports are in the trunions, and worked by an oscilliation of the cylinders, and are held in their place in the downward motion by a steam cushion below. The sawyer's valve is a perfect balance, and by moving this valve the engine can be reversed, stopped or started almost instantaneously if necessary, as the sawyer has perfect control of it by his lever either to go fast or slow. Should the sawyer let go of his lever either by mistake or any other cause, it is balanced so that the valve will come to the centre and cut the steam off both cylinders and stop the feed. When standing, the lever is locked or fastended, so that is is impossible for it to start off itself. The engine stands upright below the carriage, and bolted to two upright beams, placed on the mill for the purpose. When a rack is preferred in place of the rope, we put on a steel wheel 30 in. in diameter, and the engine placed high enough to work into the rack on carriage bar, or if the beams come in the way, an idler wheel can be used between engine and rack segs; or, the engine can be placed at a distance and have a shaft from it to the carriage; or it can be placed in the engine room, where it is under the control of the engineer for oiling, thence by shaft and pinion to carriage rack bars. These engines are well adapted for cutting long logs, or where the logs are mixed, the advantage of this feed will be apparent to mill men. When the carriages are used in two or more sections, the couplin and uncoup ling of each section is quick and simple.

There were two of these feeds working this summer and giving the best of satisfaction, one with rope feed at James Playfair & Co's Mill, Sturgeon Bay, near Waubaushene, and one at the new mill furnished by us to Francis Carswell & Co., at Calabogie Lake, on the Kingston and Pembroke R. R. This mill is working with the Rack and Pinion feed, and drops from fifteen to seventeen stock boards per minute. We have also sent one to the Rathbun Company, Deseronto, to put in to feed their heavy Circular Mills. They will also commend themselves for various other cases, especially for running Elevators, hoisting Engines, and wherever a simple and easily reversible motion is required.

We would also call attention to our Improved Band Saw-Mill for cutting logs

☞ ***We guarantee this to be the best Mill of his kind got up, and would ask any one wanting a good Band Saw-Mill to communicate with us. We would also call the attention of Mill Men to our new IRON GANGS, CIRCULAR MILLS and MILL MACHINERY. For further information, prices, &c., address the Manufacurers,***

VOL. 6. PETERBOROUGH, ONT., JULY 1, 1886. NO. 13

BURLEIGH FALLS SLIDE.

On Wednesday a deputation of lumbermen met, by appointment, Mr. T. Rubidge, Chief Engineer of the Trent Valley Canal at Burleigh, in reference to a dam and slide at Burleigh Falls which is to be constructed by the Government to take the place of certain improvements which were built by the lumbermen at this point and which the Government found necessary to expropriate for the the construction of the Trent Valley Canal.

The deputation consisted of Messrs. Hilliard, Ullyott, Strickland, and Hazlitt and of Mr. Irwin, who acts as Secretary for the Lumbermen's Association.

The interview was entirely satisfactory; it was found that the projections of Mr. Rubidge in regard to the work were entirely in accord with the views of the deputation, the only point now being the early construction of the works so that they may be completed before another season.

There is no question that the closing of the channel known as the Big Chute at Burleigh for the purpose of the construction of the locks, has put the lumbermen on this stream to a very serious disadvantage. The turning of all the water into the channel known as Little Burleigh rendered the improvements which they constructed themselves entirely useless, and we understand that it was merely the great interest which all lumbermen feel in the early construction of the Trent Valley Canal which hindered them from expressing their views as to the expropriation of these works of their own building at this point in a more forcible manner than they have done.

They, however, are now satisfied that the Government have not lost sight of the disinterested part that they have taken in the matter, and, although for two seasons past they have been laboring at great disadvantage at this point and a great unnecessary cost, it is believed the proposed improvements, which they hope will be constructed at an early date, will obviate the difficulties they have felt themselves laboring under.

THE EXPORT DUTY.

A duty was put on the export of saw logs, which is probably intended to compel the Americans who hold timber limits in Canada to manufacture the lumber here; where it fails to do so, it will bring some revenue into the country, unless it should result in leaving the limits unworked. The approaching exhaustion of the supply of timber in the States, and at a remoter period in Canada, is a matter about which opinions differ very much, and concerning which there is a great want of precise information. One thing is certain: American lumbermen find it easier to get logs in Canada than in their own country. The export duty will stand in the way of their exporting logs; and if lumber gets scarce in the States the price must go up to a figure that will enable them to pay the duty.—*Monetary Times.*

BAND MILL REPORTS.

To the Editor of the Canada Lumberman.

Sir,—We enclose to you some figures in regard to band mill sawing that will go far to establish confidence in this new and useful machine for making lumber.

S. A. Hale, Esq., of Whittlesey, Wisconsin, has kindly given us the record of five consecutive days sawing of 11 hours each, commencing

June 1st	sawed	47,492 ft.
" 2nd	"	45,816 "
" 3rd	"	54,380 "
" 4th	"	47,200 "
" 5th	"	60,667 "
Total		255,555 "

As band mills usually make from 15 to 20 per cent more lumber than the actual scale of the logs. We shall be at liberty to add at least 15 per cent., which is 38,333 feet, this added to 255,555 = 293,888. This sum divided by five, the number of days, gives 58,777 feet as the average daily cut.

About 40,000 of this whole quantity was 2 inch plank; about $\frac{3}{4}$ of the whole was 1 inch board, the remainder beside the plank, $1\frac{1}{2}$ inch.

Another report of $4\frac{1}{2}$ consecutive days work performed last month gave an average daily cut of 56,069 ft.

A large log which scaled 1,029 feet was sawn in eight minutes.

E. P. Attis & Co., of this city, are manufacturers. About 20 such mills have been started since Jan 1st and are all doing good work.

Heretofore the most potent objection to band mills was that enough work could not be got out of them, 25,000 feet per day being about the best average obtainable. But these figures approach the best cutting of the circular mills.

Yours truly,

W. H. TROUT.

Milwaukee, June 11th, 1886.

LUMBER FREIGHTER'S GRIEVANCE

The following letter appeared in the Tornoto *Globe* of June 15th:—

Sir,—Under the head of local news in this morning's issue of the *Globe*, reference is made to the mode of weighing freight lately adopted by the railroads centreing in this city, which demands more than a passing notice.

Under the words "concealed excess-weights," as contained in the circular issued by the said railroad companies, there is an attempt made to cover up from the sight of persons not immediately interested a grab game which for impudence has never, so far as the writer is aware, been tried before.

In order to make the matter plain to your readers let me say that this beautiful little scheme hatched by the railroad officials ("parlour" ones of course) is levelled at the lumbermen, and against them solely it is intended to operate. Various schemes have been brought into play from time to time in order to extort more money from this class of their patrons, such as increased rates of freight and additions to the cost of their yearly travelling tickets, but this last stroke bears away the palm for downright impudence.

The minimum load for a car of lumber is 24,000 pounds, but it must be borne in mind that there is no means provided for weighing at any of the stations where lumber loading is usually done, so that the loader must simply use his judgment. The lumber may be green or half-dry, it may be white or red pine or hemlock; all of which vary materially in weight. When any of said cars arrive in Toronto the weigh-master passes them over the company's scales. If the weight of one car should turn out to be only 20,000 pounds the consignee is charged with 24,000 pounds. Should car No. 2 unfortunately weigh 28,000 pounds the consignee has to pay for the full weight, and 25 per cent. additional on 4,000 pounds "concealed excess weight." This is an exceedingly convenient term to cover up that which anyone may see, after the above explanations, is nothing more or less than a complete swindle.

Lumberman.

DEATH OF AN OLD-TIME LUMBERMAN.

Thomas Smith, one of Ottawa's pioneer lumbermen, died at his brother's house at Stewarton on Saturday morning. He was seized on Wednesday with paralysis of the brain and sank rapidly, death resulting as above stated. Born in Ireland in 1825, the deceased, the third son, came with his parents to this country about 50 years ago. His father, the late Isaac Smith, first located in business at Hull Landing, opposite the Government Hill, now the Parliament grounds, but a few years afterwards removed to Bytown and engaged in the brewing and other business, and is remembered by the surviving Bytonians as a graceful Irish gentleman, a patient but fearless magistrate, and square upright man in his business dealings. The family of six sons and one daughter reflected the fine qualities of their parents. The deceased early engaged in the square timber business on the Upper Ottawa, taking down his own raft to Quebec over 40 years ago; in the days when good road horses and a canoe navy were the means of business transport in the lumber trade, before these of railways and traffic in charters. Industrious and knowing his business, he kept actively to it for thirty-five years, the latter twenty-five in parenership with a younger brother, Charles, his and their operations being on and from the Pettewawa, Mattawa, Amable, Dupot, Kippewa, Dumoine and other stream feeders of the Grand River. For some time past he has not been actively engaged in business. He lived at the Russell House and had but the looking after his property, means and investments to engage his time. Clean, straight, square, honest, truthful, amiable, generous, modest, but manly "Tom Smith," can only be remembered by those who knew him as a man whose word, friendship, honor and record in all relations of life were as pure, true and reliable as the sunlight. He never married, and at his death was was well off. He appeared last Wednesday evening, when seized with the fit that ended his life, to be in the best of health, even quit young looking. On Thursday he was taken to his brother Joseph's house at Stewartown. His physician entertained but uncertain hopes o his recovery. On Friday he became insensible, and his case hopeless. On Saturday forenoon, one of nature's few noblemen passed away, to be hereafter numbered with his eldest splendid brother Joshua, and the latter's companions of the Ottawa and this city: John Egan, Col. McDonald, Big Rogerson, Jerard McCrea, James Skead, Daniel McLachlin, John Supple, Wm. Morris, Jos. Aumond, Robert Conroy, Samuel Dickson, William McAdam, the Grahams, (Black and Madawaska Bill), John Thompson, Wm. Byers, Frank Powell, John Bower Lewis, Wm. Stewart, George R. Baker, Edward Sherwood, Christopher Armstrong, Godfrey Baker, Charles O'Connor, James Fraser, with his youngest, happy and humorous brother Patton—amongst the ever increasing, but silent majority.—*Ottawa Journal.*

BIG FIRE IN OTTAWA.

Ottawa, June 18.—About one o'clock this morning the furniture factory of J. Oliver & Son, on Head street, Chaudiere, was discovered by the night watchman to be on fire. He immediately gave the alarm, and the city brigade and the Union Fire Company promptly turned out. The building, which was a two storey one, 100 feet by 30, was well filled with furniture; the whole being inflammable as a tinder box, and, despite the four heavy streams of water poured upon the flames, the entire building was consumed. The wooden building adjoining, forming part of Baldwin's planing mill, caught fire several times and one side wall was pretty badly burned as well as a portion of the roof. McKay & Co., whose oatmeal mill adjoined Oliver's, also lost a little by the fire, smoke and water. Though the fire was in the heart of the lumber district, yet, fortunately, high brick and stone buildings checked it on two sides. The river was on another and on one side only was danger threatened, unless a heavy wind sprang up. Mr. Oliver places his loss at about $10,000, on which there is but about $2,500 insurance.

AUSTRALIA.

Messrs, Lord & Hughes' monthly circular, dated Melbourne, May 15th, says:—Since our last circular of 19th April, the business in timber has been interfered with by the usual Easter holidays, and auction sales restricted.

The imports of all descriptions of timber keep up in excess of requirements, and stocks are still accumulating. The efforts of importers to force sales at auction resulted in a decline in Oregon, and a dull, heavy market for American, Baltic Dressed, and Kauri, all descriptions with a downward tendency in prices, while Baltic deals, of good quality, have somewhat improved in price. The arrivals of Oregon the last few days have been heavy, and will have a detrimental effect on prices. The arrivals of all descriptions of building material, such as slates, plaster, cement, laths, pickets, etc., have been unusually heavy, not only by direct shipments, but by transhipments from other colonies, which have had a prejudicial effect on our market.

Trade from the yards does not seem to fall off, but continues as heavy as ever, but they are unable to absorb the excessive imports that are weekly offered at auction.

RED DEALS.—Imports—18,891 pieces from the Baltic, and 2,709 pieces from London. The arrivals have been the "Juniper," from Gefle, and "Lancaster Castle," from London. The principal sale by auction during the month has been the cargo ex "Jotun," on the 7th inst., S K B brand realizing for 12x4, 11x4, and 9x4, 6d., 11x3, 6⅛d.; 9x3, 6⅛. to 6d.; 7x3, 5½d. to 5d.; 7x2½, 5½d. to 5d.; 7x2, 5 5-16d.; D O M brand 12x4, 5⅝d.; 11x4, 5 9-16d. to 5⅝d.; 9x4, 5⅝d ; 11x3, 6d. to 5⅝d.; 9x3, 6⅛d. to 5d.; 7x3, 5⅜d. to 4¼d.; 7x2½, 5⅜d to 4d.; 9x2, 5⅜d. to 5¼d.; 7x2, 5¼d. to 4¼d per foot of 9x3. Last month's prices are well maintained, and for good joiners' deals there is an active demand.

SPRUCE DEALS.—Imports—13,918 pieces. The arrivals have been the "Howard," from Saguenay; "Slieve Donard," from Liverpool; and "Wakefield," from Boston. Sales comprise shipments ex "Mary S. Amess," Sydney steamers, and "Wakefield," 11x3 realizing 3¾d., and 9x3, 3d. to 2⅞d. per foot 9x3.

OREGON TIMBER—Imports—4,920,005 feet super. The arrivals have been "Cambrian Chieftain" and "Sarah S. Ridgway," from Tacoma, "J. P. Smith" and "Hospodar," from Port Blakely, and "Record," from Burrard Inlet. The balance of "Narwhal's" cargo was quitted on the 4th inst, at from £5 5s. to £4 15s., average, £4 19s 2d. The "Cambrian Chieftain" cargo on 7th inst, at from £5 to £4 12s 6d., average £4 15s. 3d., and the cargo ex "Sagamore," on the 11th, at from £5 5s. to £4 15s, average £4 16s 2d, Imports for the month are unusually heavy and, if continued on the same scale, the present ruinous prices cannot be maintained.

LUMBER —Imports—Clear pine, 128 883 feet super; shelving 163,292 feet super; T. and G ceiling, 23 884 feet super. The arrivals have been "Wakefield," from Boston, 'Sarah Hignett," from New York. and "Charles and Arthur,' from Adelaide. Prices ranging for clear pine, £13 5s. to £14; shelving, £8 17s. 6d. to £10 5s; T. and G. ceiling, at £8 15s. to £9 2s. 6d per 1 000 feet super.

REDWOOD.—Imports—*Nil.* The "Alice Muir" cargo was offered on the 7th inst., when only a small portion of 5in. and 6in. was sold at £10; holders declining to accept less.

FLOORING AND WEATHERBOARDS.—Imports—4,243,072 feet lineal. Arrivals are "Forfarshire," from Frederickstad; "Aurora" and "Celer," from Christiania; and "Emily," from Adelaide. Sales have been made of shipments ex "Regina," "Celer" add "Othilde," at the following rates:—Red, 6x1½, 9s. to 8s. 9d.; 6x⅞, 7s. 6d. to 7s. 3d.; 6x¾, 6s. 6d. to 6s. 6x½. 4s. 10d. to 4s. 9d.; 4-out, 5s. to 4s. 11d.; white, 6x1⅛, 9s. 6d.; 6x⅞, 7s. 6d. to 7s. 3d.; 6x¾, 6s. 6d. to 5s. 9d.; 6x½. 4s. 11d.; 4-out, 5s.

KAURI PINE.—Imports—697,647 feet super. The arrivals have been per "Nora," from Kaipara, and "E. O. Clark," from Wangaroa. Sales comprise shipments ex "E. O. Clark," "Parnell" and "Nora." Hewn logs sold at 11s. 6d. to 10s. 6d.; flitches, 23s. 6d. to 14s.; sawn boards, 22s. to 13s. 9d.; shelving, 20s, to 16s. Sales difficult to effect for anything but superio timber.

PITCH PINE.—Imports—31,781 feet super. This small consignment of T. and G. ceiling arrived per "Sarah Hignett," from New York, and is now in course of landing.

CEDAR.—Imports—80,344 feet super. This parcel arrived per Sydney steamers, and "Charles and Arthur," from Adelaide. There have been various sales during the month, and last month's rates have been fairly maintained, good, sound logs realizing up to 43s. 6d. per 100 feet super. The trade is now heavily stocked.

DOORS.—Imports—751. These arrived by the "Sarah Hignett," from New York, and "Ly-ee-moon," from Sydney, and came to the order of the trade; only a small line of 2 ft. 8in.x6ft 8 in.x1¼ in. was quitted at auction, at 10s. in bond.

LATH AND PICKETS.—Imports—Laths, 18,977 bundles; pickets, 4,893 bundles. Sales have been made of sundry shipments, 4½-feet Oregon laths realizing 30s. 6d. to 28s.; 4½-feet spruce, 30s. to 28 s.; 4-feet, 25s. 6d. to 24s. 6d. pe 1,000.

SLATES.—Imports—475,854. The arrivals have been "Slieve Donard," from Liverpool; "Wakefield," from Boston; "Sarah Hignett," from New York; "Lillie Hawkins," from Adelaide. There have been various offerings during the month, but prices realized have not been satisfactory to importers.

PLASTER —Imports—835 barrels. These arrived per "Wakefield" and "Sarah Hignett," from U. S. A. The only sale by auction has been a small invoice of Knickerbocker brand, at 9s. 9d. per barrel.

CEMENT.—Imports—7,750 barrels. Comet brand, at 5s. 6d. per cask, and Gibbs & Co's Portland at 9s. 6d. Stocks exceedingly heavy, and sales difficult to effect of unknown brands.

GALVANIZED IRON.—Imports—1 459 tons. On the 14th inst., a small shipment from Adelaide of Redcliffe Crown, 26-guage, was sold by auction, at £16 7s. 6d , and Walker's 3 Crowns, at £16 2s. 6d. per ton. We hear of a line of 200 cases Orb on the spot and to arrive, having been placed privately, at £17 10s. per ton.

EXPLANATION.—Red deals and spruce deals are sold at per foot of 9x3; T. and G. flooring at per 100 feet running; Oregon timber, redwood, clear pine, shelving, ceiling, per 1,000 feet super; Kauri pine and cedar logs at per 100 feet super; laths, pickets and slates at per 1,000 pieces. Shorts are all lengths under 12 feet.

TYNE.

The *Lumber Trade's Journal* says:—The list of last seven days' arrivals is a long one, and covers several ships from the lower part of the Baltic with deals and battens There is also an arrival of pitch pine timber, and a more than usually heavy list of pit-prop arrivals which appear principally to be going into stock. One cargo of Memel deals is reported, two cargoes of staves from Bjorneburg, one from Oscarshamn, one cargo per steamer of usual assortment from Christiania, and another one from Gothenburg, make up a more than usually heavy list. So far there is not any improvement to note either in prices or in demand. A small business is being done, but it is very small, and is as free from speculation as it is possible to be. Buyers buy only from hand to mouth, and the margin of profit, at any time low, appears at the moment to be reduced to much less than usual limits.

There is very little change to report in the shipbuilding and housebuilding trades. Several of the shipyards are practically at a standstill, and no immediate prospect of any alteration.

THE drives are nearly all down the Seguin river, says the *North Star*. The P. S. L. Co's. drive on the Boyne is well down and all the logs belonging to the different companies of this place are now safe.

AT Taylor Bros. steam saw mill on Upper Don road, near Toronto, on June 18th, Wm. M. Knox, head sawyer, was taking a slab off a log when a portion of it broke away, fell on the circular saw, and was thrown against him with great violence, knocking him senseless and causing severe internal injury.

PORTABLE SAW MILLS.

A *Norwich*, Conn., despatch says:—The wood chopper's axe and the old-fashioned saw mill cannot destroy the Connecticut forests fast enough to satisfy greedy farmers who like a dollar better than a tree. The portable steam sawing machine is the worst pest many persons think that ever visited New England. It hum is heard all day in all parts of this state. Four horses can draw it up the steepest hillside in the most remote woodlands, and timber that a few years ago was not worth marketing on account of its distance from the old saw mills is now easily available.

The portable saw mill is pulled into a tract of woods and is unlimbered and set up. It is a single machine. There is a buzz saw that runs with lightning speed in a heavy frame, and an upright boiler and engine. The black smoke funnel towers above the highest trees, and all day pours a column of smoke out of the very heart of the forest. The saw, whose slashing strokes, sounding like the bussing of a great locust, may be heard at a long distance, rips up the timber which has been felled in the vicinity of the mill. After that has been sawed the mill is wheeled further into the woods. The forest disappears rapidly before its steady advance. After a tract has been cropped of its wood the steam mlll is driven into a new district, and the work of destruction is continued. The wood that is sawed is mostly chestnut, oak or birch. It is sawed into planks or railroad ties; the planks go to New York

The first portable saw mill that visited this town is owned by Mr. Peckham of Colchester It has been at work on the extensive forests west of the city three or four weeks and has sawed more than 100 000 feet of lumber. The flinty hills, which are good for nothing except to grow timber on have been stripped of their wood, and the whole country over which the mill has passed looks scarred and desolate Mr Peckham makes his home in the woods while he is destroying them. A rough plank building, in which three rooms are erected a few household utensels are gathered into it, and Mrs Peckham, who accompanies her husband, cooks sews and washes for the workmen. She is assisted in doing her duties by the wife of one of her husband's employees The bare little shanty is not without the enjoyable things of Connecticut village households; the markets are not far away, there are newspapers and books on the unplaned shelves and Mrs Peckham and her helpmate enjoy their life. There is a flavor of romance in it. They are in sight of villages and trim homesteads, and the gilded tips of city church spires; at the same time they are not vexed by little cares of civilized life, and gossips and other bores do not intrude. At night the little settlement in the woods looks very bright and cherry. Its lights stream through the cranneries in the cabin and partially illum nate its rude surroundings, the paraphernalia and litter of a lumber camp, and the black background of forest. Inside the tired men sit about the rough table perusing old newspapers and telling older stories, while the women sew. From the door of the cabin may be seen the twinkling lights of villagers on three sides. At 9 o'clock the lights are put out and all go to bed. Breakfast is eaten early, steam is made in the boiler, and at 7 o'clock the whistle is blown for the men to go to work. The whistle is sounded three times a day, as in factories.

The portable saw mill was first introduced into this State about ten years ago, and its advent has since been viewed with disfavor by many men who are interested in the preservation of the forests. On the other hand, men better acquainted with the grass and tree producing quality of Connecticut soil, and who are not influenced by selfish motives, think that there is no cause for alarm. A tract of land that has been cleared of its timber will grow a new forest within twenty or thirty years, and many of the finest forests in the State are on land that was on mowing lots forty years ago Stone heaps at regular intervals in these forests which were piled up at the time the land was in grass, attest the truth of the statement.

Mr. Peckham has nearly completed his contract for sawing wood in this town. He moves his mill next to East Haddam, into the big forests about the Devil's Hopeyard, not far from the Connecticut River. His business is a profitable one; he can saw about 10,000 feet of lumber a day, and he works more cheaply than the water saw mills do.

WOOD-WORKING PATENTS.

The following list of patents relating to the wood-working interests, granted by the U. S. patent office, June 15, 1886, is specially reported by Franklin H. Hough, solicitor of American and foreign patents, 925 F street, N. W. Washington, D. C., who will furnish copies of patents for 25 cents each.

343 785—Saw dresser, circular—H. D. Wolcott, Wrights, Pa.

343,658—Saw-teeth, devise for swaging—J. A. Crossman and N. C. Buch, assignors to E. C. Atkins & Co, Indianapolis, Ind.

343,713—Saw tooth—S. Kinney, Brownsville, Cal.

343,787—Sawing off stumps, machine for—J. Q Adams, Saginaw. Mich.

PATENTS ISSUED JUNE 22ND.

344,130—Bit-brace—B. L. Osgood, Buffalo, N. Y.

344,292—Saw-guard, knob—A. Touchette, Manistee, Mich.

344 175—Saw-guide—J. F. East, Tanners Creek, Va.

344,234—Saw, hand—M. Barrick, Nova, Ohio.

344,066—Sawing-machine, circular—C. Tollner, Pulaski, N. Y.

Tale of Timber Limits.

There was a large assemblage, says the *Globe*, of moneyed men at the Toronto Mart on Saturday to bid on the five timber berths on the north shore of Lake Huron, that were offered separately, and the three in the same locality that were offered *en bloc*. Limits 4 3 and 5, near the Georgian Bay, on the Wabuapitac River, containing 36 square miles, were also put up and knocked down to C Boeckh & Co, for $2,600; No. 54 was withdrawn, at $6 500; 84 was sold to Henry Hart, for $6 000 subject to a reserve; 93 opened t $10,000, and ran up to $20 000 at which price it was sold to James Maxwell subject to a reserve: 68 and 70 were withdrawn.

Preserving Power of Water.

A remarkable instance of the preserving power of water in respect to logs submerged is supplied by the following extract, taken from the pages of our contemporary, the *Lumberman's Gazette*, of May 26th, Speaking of the driving streams in the Chippewa district, it states that among the logs brought down this spring to be sawed at the La Crosse mills are thousands that have been lying in the smaller creeks for the last twenty years. Logs were found bearing the stamp of the owner, dated 1867. On log is supposed to be the largest ever taken out of the Black River country. When measured it scaled 2,000 ft., and was cut nineteen years ago this spring.

U. S. Tariff Revision.

Washington, D. C., June 27.—Mr. Randall will to-morrow introduce his Tariff Bill in the House. The Bill, he says, does not contain anything novel or extraordinary, and is designed to build up much needed industries, revive those that are languishing, and remove inequalities in the existing law He does not claim that the Bill is a complete or perfect measure of tariff revision, but holds that it is a decided step in the right direction and a sufficient indication of the policy that should be pursued in remodelling the tariff and revenue laws. The changes in the rates proposed are to go into effect on the 1st of January, 1887.

THE prevention of decay in wood is said to be effectiveiy accomplished by exhausting the air from the pores and filling them with a gutta-percha solution, a substance which preserves the wood alike from moisture, water and the action of the sun. The solution is made by mixing two-thirds of gutta-percha to one-third paraffine, this mixture being then heated to liquefy the gutta-percha, when it is really introduced into the pores of the wood, the effect of the gutta-percha being, when it becomes cool, to harden the pores.—*Building.*

Chips.

TIMBER rafts, the Port Hope *Guide* says, are being built in the new harbor, and a large number of men are engaged in the work.

THERE will be no necessity for discussing, just at present, what the Morrison bill does or does not include. The discussion may be postponed for a year or two.

MR. JAMES DICK, inspector of hulls, says the Lake Ontario current is always easterly, except when a wind or gale continues several days from the east, and at the termination of the easterly gale is stronger in its easterly course.

ON June 22nd fire destroyed the saw-mill on the Lake range, foot of the second Concession Saugeen, belonging to D. Campbell. Nothing was saved. Insured for $1,200 in the London and Middlesex Company.

WHILE Mr. John R. Paul was cutting some cedar blocks in the cedar mill, Deseronto, the axe glanced cutting his wrist very severely. It was stitched by Drs. Newton and Clinton. He lost about one gallon of blood, the *Tribune* says.

DURING 1885 there was shipped from California to Australia 5,950,000 feet of redwood pine. This, in one way, indicates the possibilities of Canadian trade on the Pacific ocean when the line of steamers are running from the terminus of the C. P. R.

FOREST fires are raging in the vicinity of Moncton, N. B., and at various points along the northern division of the Intercolonial. At Kent Junction, the station buildings are in danger, and if the rain does not fall will likely be destroyed. No rain has fallen here for nearly a fortnight.

S. & J. ARMSTRONG, says the Burk Falls *Arrow*, have concluded a contract with the Ontario Lumber Co. to cut about a million feet of logs taken from the township of Strong. This with their own and the custom cutting, will make things at the mill lively until late fall, if not into the winter.

ONE Saginaw firm has avoided the effect of the recent advance of the export duty on logs by the Canadian Government. The *Courier* states that Messrs. Hill, Bliss & Wells, who owned timber limits in the Georgian Bay region estimated to cut 150,000,000 feet of pine, have sold the same, nearly doubling their investment.

THE log jam of 200,000,000 feet, which commenced in the St. Croix River, at Taylor's Falls, Minn., on June 13, still continues, and is worse than ever. Since the jam occurred three hundred men, forty horses, and three steamboats have extricated only 15,000,000 feet, which is less than has entered from above. The logs in the jam are valued at $2,000,000.

THE first annual meeting of Bryant, Powis & Bryant, London timber dealers, was held recently. The report showed a dividend of 15 per cent, and a balance carried forward of £7,375. 4s., 11d. The success of the company, which has been in existence only a year as a company, is unprecedented. The complaints of dull trade which have come across he water have scarcely prepared Canadians for such an announcement, and the management of this company's affairs must be in exceedingly good hands.

THE amount of timber in the Georgian Bay country of Ontario, owned by Michigan men, are estimated as follows:—Emery Lumber Company 100,000,000 feet; Folsom & Arnold, Bay City, 200,000,000 feet; R. A. Alger & Co., Detroit, 150,000,000 feet; Fowler & Chapman, Bay City and Detroit, 100.000.000 feet; Hills, Bliss & Wells, Saginaw, 100,000,000 feet; Cheboygan Lumber Company, 150,000,000; Bewick, Comstock & Co., Fletcher Pack & Co., Gilchrist *et al*, Alpena, 600,000,000; McArthur Bros., Saginaw and Toronto, 350,000,000; total, 1,750,500,000 feet.

AN Ottawa despatch states that the raft of Messrs. McLachlan Bros., consisting of eighty-eight cribs containing 2,462 pieces red pine timber and 533 pieces of sawn dimension timber, left there on the 9th for Quebec. Messrs. J. R G. Bryson's raft, consisting of sixty-nine cribs, passed the Chatts slide on the 7th inst., and is now running over the Chaudiere slides.

THE Rathbun Company's drive of logs and timber on the Salmon River, say the *Tribune*, is making good progress considering the low state of the river. It was thought a few days ago that it would be almost impossible to bring this large drive through, but under the able supervision of that veteran manager, Tobias Butler, Esq, we feel reasonably certain that the logs will be safely delivered in the booms at Deseronto.

HITHERTO it has always been thought necessary, says the Ottawa *Free Press*, to go to Michigan to see lumber cut fast, but the work done by Messrs. Flatt & Bradley's mill at Casselmen recently, shows that we know something about it in this section. On Wednesday, in that mill, a single 66-inch circular saw cut 113,000 feet, 60,000 feet being deals. It is questionable if any Michigan mill can beat this record.

SINCE the opening of the season the following quantities of saw logs, etc., belonging to the firms mentioned passed through the Gatineau:—

W. C. Edwards & Co	18,946
The Rathbun Co	6,654
Hamilton Bros	14,166
J. McLaren & Co	14,605
Total	54,371

THE Eganville *Enterprise*, of June 23rd, says:—The high wind which prevailed on Thursday evening last had the deteriorating effect of breaking two booms of logs on Round Lake, containing sixty thousand pieces, belonging to Messrs McLachlin Bros., of Arnprior. This will delay the drive for a short while. It will be about three weeks before this drive reaches here, as the water is very low in the Bonnechere. The Madawaska logs are about six weeks' drive from Arnprior, and as the logs are short at that place one of the mills was shut down in consequence.

THE *Lumberman's Gazette* says:—The Emery Lumber Company of this city and Saginaw have 15,000,000 feet of logs in the Spanish River they intend to bring over and which will cost $30,000 more on account of the change in the duty. That would be a fair amount of profit on the venture. McArthur Bros., of Saginaw, it is said, have some logs in the same district, 3,000,000 feet, which they had sold in Buffalo, and they are fortunate enough to have paid the export fees before the duty was raised, by which they saved $6,000.

If any of our readers that are afflicted with rheumatism have never tried West's World's Wonder or Family Liniment, we advise them to do so at once, and be convinced of its extraordinary merits. It is a never-failing remedy for cuts, sprains, bruises and all complaints requiring external treatment. Price 25 cents and 50 cents per bottle. Sold by J. D. Tully.

For the past quarter of a century West's Cough Syrup has given relief to thousands, and no medicine compound can show such a vast number of unsolicited testimonials. Ask your neighbor as to its merits. It is an unfailing cure for coughs, colds, hoarseness, asthma, bronchitis, consumption in its early stages, and all throat and lung diseases. Price 25c. 50c. and $1.00 per bottle. Sold by J. D. Tully.

WOODS ON EXHIBITION.

The *Timber Trades Journal* of June 5th continuing its notice of woods in the Colonial Exhibition in London says:—

We note that since we last laid down our pen considerable additions have been made to the Canadian Court. The explanation afforded of the apparently unfinished state of the Canadian Court was that a lot of the exhibits were on the sea. As observed, the chief portion of these have since arrived, and Canada is now every whit as well represented as any of our other colonies. The specimens of the various woods have also been added to, and the carved show cases from New Brunswick are strickingly illustrative of the ability and enterprise our fellow-subjects across the Atlantic throw into everything they take in hand.

In fact, throughout the exhibition great care has been bestowed upon the forest productions, the various specimens of timber and plank of each country, including the classification and arragement, evidently being the work of those who had their soul in the business.

The public are indebted to the Canada and Pacific Railway Company, Montreal and Quebec, for a neatly arranged cabinet with samples of all the merchantable woods culled from the forests through which this important railway passes.

The New Brunswick Railway Company likewise contributed the different specimens of the woods from their part of the Dominion already mentioned, and the arrangement and selection are highly creditable, the cabinet containing the different specimens being very artistically constructed, the panels being composed of finely finished boards of each variety, and the pilasters branches of the several trees with the bark on. The sample cases contain other specimens of the woods, with a facsimile of the leaves painted thereon.

This illustrative method of adornment is, however, not confined to the Canadian exhibits, many of the Australian planks being similarly treated. Another interesting feature is making the various seats, on which the visitors rest, of the woods of the country. Of course the pine varieties from Canada are too well known to need any particular description here, but the different specimens supplied by Messrs. Burstall & Co., of Quebec, are well worth looking at; some of the huge blocks, cross-sections of these forest monsters, 3 feet and more in diam eter, with the bark just as they were felled, were still in the shape they were put on board ship, a faw boards nailed around to save them from abrasion; indeed, there is yet a considerable amount of labor to bestowed on the wood department of the exhibition, for in addition to these we come across other huge blocks from the forests of the Andaman islands and elsewhere, that lay still unpacked.

The Canadian Government are to be credited with some excellent botanical specimens, including a collection of the flowering plants and ferns of the Dominion. We think these latter are simply excellent, and vie even with the Australian exhibits, the land of the kangaroo being especially a country of ferns. The photographs of the forest giants, which the Dominion Government furnish, framed in wood, of the species represented, are also highly interesting.

The woods of commerce are, of course, the chief objects of interest to those actually engaged in the timber trade. To several of the Canadian ladies, including Mrs. Chamberlain, of Ottawa, Ontario, and Mrs. C. P. Traill, we are indebted for an exceedingly beautiful arrangement of flowers and fungi. Mrs. Hill, of Amherst, Nova Scotia, contributes an album with splendid plates of British Columbian wild flowers. Nor is Quebec behind—Miss E. M. Jack, of Chateau, Quay Basin, Quebec, sending through a friend a collection of forest tree seeds with the flower of each seed painted and classified.

The Royal City Planing Mill Company, New Westminister, British Columbia, furnishes specimens of spruce and bark from that part of the Dominion, and Mr. C. C. Stevenson, of Montreal, likewise a handsome collection of the various woods. The exhibition of prepared lumber is a very attrative part of the wood exhibits, and includes toys and domestic utensils, these latter forming a very considerable portion of the industries of the country. Prominent amongst the contributors of these are the Brandon Manufacturing Company, of Ontario, and Mr. H. Bulmer, jr., and brother, of Montreal, Mr. Ewen Campbell, of Brae, Prince Edward's Island, who supplies some excellent samples of sawn cedar shingles, for roofing and other purposes, the Canadian Government and the Canadian Pacific railway being likewise contributors of manufactured goods and furniture from the Northwest.

The pine mouldings supplied by Messrs. Gignac & Co., of Quebec, are specimens of what can be done in this way by the Canadians, and it is rather a matter for surprise that a trade in pine mouldings between the mother country and Canada has not further developed itself. We know shipments have been made and a trade on a considerable scale attempted, but hitherto without much success, the low-priced stuff from the Baltic side shutting up most of the avenues for its introduction.

The boatbuilding industries of the Dominion are well represented, since our last visit, by some capital specimens of both fishing and pleasure boats of spruce cedar and other woods. The prices of these are marvellously low; decent cobbles or "Dories," as they are termed, strongly constructed, being ticketed at from $20, Mr. Albert Butler, of Yarmouth, Nova Scotia, having supplied several boats of the fishing class, of which he, it seems makes a specialty. There is a capital specimen of a centre-board sailing boat for bank fishing, built entirely of spruce, at equally low prices. This description of boat might be used with advantage at many places along our coast, and is well wor the attention of Poole fishermen and at places like Lynn, Boston, and in rivers like the Stour these crafts might be found serviceable. Amongst the constructors of these and other crafts at Nova Scotia are Joseph W. Wolfe, of Lunenburg; John William and Isaac C. Cromwell, of Shelburne; J. C. Morrison, of the latter place; Conrad & Anderson, of Lunenburg; besides James S. Ferguson, of Pakenham, Ontario, who contributes a splendid specimen of a salmon fishing canoe.

The birch, beech, ash and elm from the lower ports are unsuitable for this market, and the hardwoods generally are not so well grown as those from the upper provinces; and, while the supply of the latter is sufficiently plentiful the occasion for turniug attention to the hardwoods of New Brunswick and Nova Scotia has hardly arisen. Of the woods exhibited the maple, both figured and bird's-eye, is a very high standard of excellence, but it never successfully competed with the home species. Another thing operating against its sale is that it has gone out of fashion, and even in picture frames it is now seldom seen, while for furniture pitch pine and walnut are the substitutes. In addition to this the Canadian supply could never be depended upon, and this irregularity compelled the trade to rely on the home grown timber.

We must not forget that for many of the fancy woods of Canada the United States are better customers than we are, and their ability to get the stuff at a cheaper rate of carriage keeps the trade running in that direction.

The Quebec walnut, of which we saw some well grown specimens, is too well known to need any particular mention, a remark that applies to the birch, which, like ash and elm from the upper provinces, are of every day use among us.

Woods like buttonwood, butternut, hickory, &c., will only come into use on this side in a manufactured state; in fact, a daily improving trade is already being done in such goods, which as utensils, are known under the cognomen of "domestics."

Tamarac and hacmatac, once highly thought of this side of the Atlantic, are sold at ruinous prices when they come over here now, the former uses for these woods having almost entirely disappeared. In the palmy days of wooden ships for knees, transoms and beams this description of timber had a special value, but in the construction of iron vessels hacmatac or tamarac is not wanted as planking it was least serviceable.

We have touched on the merits of the various woods, representing the forests of the Dominion, and the question of their adaptability for this market will depend on the ability of the forest owners to get them over here at sufficiently cheap rates.

New undertakings are always surrounded with difficulties, and, while the present depression lasts, there is nothing sufficiently promising in the outlook to foster enterprise of that nature.

We are good customers of the Dominion, and the large inroads into their forest which the hatchet has made are laid at our door; still, if a trade in the less common woods can be established, well and good, there is no better market to try it in than London.

Before quitting Canada we may mention that the display of metal industries is something surprising. Axes, adzes, tools of all kinds form a show in themselves, and the ironmongery is simply perfection. In fact, as far as machinery is concerned, the Dominion is a long way in advance of any of our colonies, and both for wood-working and agricultural purposes the appliances exhibited are every way worthy the proud position Canada holds.

In machinery, furniture, and musical instruments she vies with the United States, and in the latter probably outrivals her neighbor. We noticed a fine display of marble, which seems to be another industry of the Dominion, and one in which she is likely to take the pride of place. Bricks and pottery generally are also a speciality, and so of nearly all the articles of daily use.

We may add that the Executive Commissioner for Canada is Sir Chas. Tupper, C. B., who has very kindly given us every information concerning, and fullest facilities for examining the exhibits in this section. Of the care and attention which we have found this gentleman to give to the smallest matters connected with the interests of Canada, we must express our hearty appreciation, and are sure that his labors cannot but be of the greatest value to the colony he so zealously and courteously represents.

BOUND FOR AUSTRALASIA.

Alderman Alexander Wood, of Winnipeg, who was yesterday appointed agent general for the Dominion for Australasia was seen this morning by a representative of the *Free Press*. He said that he should leave in a few days for Sydney, N. S. W., where he will establish an office.

"What is wanted," said Alderman Wood, "is a knowledge in the country to which I am going of the products and capacity of the manufactories of the Dominion. The commercial relations of these two countries need to be developed in a practical way."

His intention is to first prepare a pamphlet showing the trade done between Australasia and Great Britain, the United States and Canada, and illustrating how far the condition of the Dominion could be improved with respect to the export of manufactured goods. He proposed for this purpose visiting the great manufacturing centres of the country to ascertain their capacity for manufacturing certain articles consumed in Australasia, as well as the ruling price in the home market. Then samples of their goods will be obtained and it is understood that they will be freighted free by the Canadian Pacific Railway as far as possible. On arriving at Sydney a central office will be opened where trade journals, directories, and other information will be supplied to the importers. An exhibition hall for samples of Canadian manufactures will be thrown open and everything possible done to induce our fellow colonists to take advantage of the Canadian markets.

"In what special lines do you hope to divert trade?"

"Principally agricultural implements, carriages and horse carts, passenger and freight cars, saws and tools, machinery of all kinds, leather, organs and pianos, oils, sugars, tobaccos, household furniture of all kinds and a thousand other things."

"Where are these lines of trade mentioned now going and how do you hope to obtain them?"

"Well I will tell you. In 1885 the United States exported $250,000 worth of agricultural implements to Australia, while the Dominion of Canada only sent $256 worth. We can make and sell this line of goods just as cheap as the Americans, and give just as good a quality of machinery. This trade should be divided. Then take the trade in carriages and horse carts; the United States last year sent out $388,000, while Canada's trade was not worth a dollar; for the same time the American manufacturers exported $86,000 worth of railway and freight cars, and in machinery of all kinds over three quarters of a million dollars; leather $147,000 worth from the United States, Canada nothing; pianos and organs, United States $138,000, Canada $8,000; illuminating oil, United States $931,000, Canada not to exceed $1,000; sugars, United States, $601,000, Canada hardly anything; tobacco $931,000 from the States with no trade from Canada. Household furniture and woodenware of different kinds, United States $1,000,000, Canada about $8,000. Of course these figures all apply to the year 1885, and show exports from Canada and the United States to Australasia."

"When I was in Quebec recently," continued Mr. Wood, "I noticed a tobacco manufacturer putting up a shipment of his own make for a London house, ordered by a Boston broker, to be shipped to Sydney via Boston. He told me he could make the same grade of tobacco as put up in the United States at two cents per pound less on account of the cheapness of labor."

"The trade needs looking after," said Mr. Wood, "that is all that is needed. The United States exports to Australasia should more than be divided with this country, and as soon as the Canadian Pacific gets its line running through to the Pacific and a line of steamers running regularly between Vancouver and China and Australasia, we will be in better shape to make rates for goods for through shipment."

"Have you any idea when the line of steamers mentioned will be put on?"

"Just as soon as there is any business for them."—*Ottawa Free Press.*

OTTAWA RIVER IMPROVEMENTS.

Improvements of a very extensive character which will go a long way towards improving navigation, as well as the forwarding of lumber along the Ottawa and its tributaries, have just been completed under the directions of the Dominion Government. Repairs have been made at the principal stations, slides have been reconstructed, booms have been laid, and piers have been built, involving an outlay of many thousands of dollars. The points at which work was performed included the Coulonge, Black, Gatineau, Pettewawa, Madawaska and Desmoines rivers. The most extensive work in re-constructing the Coulonge slide, and in executing repairs at Carillon station, where the piers, booms and slides, damaged by an ice shove last year, were thoroughly overhauled and repaired. A large gang of men are engaged blasting rocks in the timber channels at the head of Lake Temiscamingue, thus opening up an extensive lumber region hitherto unvisited. The improvements are being made on the Quinze rapids which extend a distance of 13 or 14 miles. The rocks in the channel form the only barriers to the descent of the logs and when once removed will go a long way towards opening up that distant region.—*Eganville Enterprise.*

We are informed, says the *Herald*, that about 85,000 railway ties are to be cut at the Rathbun mills in Campbellford, this summer and next fall, besides the production of lath and shingles which is also large. This will exceed last years operations by 50,000 ties. The average capacity of the mills in ties alone, is 650 per day, and at this rate it will require five months to complete the contract. Extensive improvements have been made in the mills and on the premises, getting in readiness to resume work at an early date. Employment will be given to a large bevy of men.

The ravages of the recent fire in Hull, Que., are being rapidly repaired. Some 60 or 70 new houses are in course of erection. This speaks well for Canada's mill town.

Chips.

JOHN MEAGHER had his leg broken June 5th. He was working in Rathbun's mill, Deseronto, when a slab struck him with the result named.

EXTENSIVE forest fires have lately raged in the vicinity of Hermansville and Wausaukee, upper Michigan.

THE planing mill of Lewis, Seymour & Martin, Toronto, was on June 12th damaged by fire.

A FIRE at Muscatine, Iowa, on June 12th destroyed ten million feet of lumber, a saw mill valued at $60,000 and several houses and bridges.

MR. THOMAS SMITH, a well known lumber merchant died on June 7th. He was attacked with paralysis of the brain on the 2nd and sank rapidly.

THE river drivers on their way down Crow River, Ont., with a large drive of logs. They will reach the Trent and arrive at Campbellford in a few days.

ON a late Wednesday the largest lumber fleet that ever sailed from Marquette. Mich., in one day left that port. It consisted of seven vessels loaded with over 3,000,000 feet of lumber.

ON May 27th Messrs. S. & J. Armstrong shipped the first cargo of clear dry pine lumber from Burk's Falls over the N. & P. Junction Railway, thus practically opened the outward bound freight business of the new railway.

ABOUT 11 months ago Sibley & Bearinger bought what is known as the Gamble pine tract in Ogemaw county, paying therefor $105,000. It is reported that the same tract has been sold to Detroit parties for $175,000. It is estimated to cut 30,000,000 feet.

FOREST fires in the vicinity of Cadillac, Mich., burned considerable standing timber. Several pieces belonging to Dr. A. Blodgett were burned over, and much timber killed, so that it will have to be cut. About 200 acres in all was thus served by the fire.

THE railway from Lake Winnipeg to Hudson's bay is likely to be built. The Manitoban Government is to guarantee interest on $4,500,000, as capital, for a period of 25 years. Work of construction is to begin at the northern end of Lake Winnipeg.

WHILE Mr. O. E. Howell, of Jerseyville, was teaming logs into the mill yard of Mr. Obed Howell's in some way one the logs he had on the trucks slid and caught him. When found the log was lying on his breast and he was unconscious. It is thought that he will recover.

FOREST fires in the vicinity of Florence, Wis., last week destroyed 400 cords of wood belonging to the Florence Furnace Company. Woods fires prevailed at many points throughout northern Wisconsin and upper peninsula of Michigan, burning much standing timber, and destroying ties, poles wood and bark.

WE learn with interest that the Victoria *Times* that according to a telegram from Port Townsend, the Port Discovery saw mill has received from Japan an order for ties to the amount of 120,000,000 feet. The mill in question has never cut more than 30,000,000 feet in one year. It would accordingly take four years of steady work to fill the Japanese order.

THE lumbermen's section of the Toronto Board of Trade are moving to have the railway companies fix the freight rate at so much per thousand. The Secretary of the Board of Trade has interviewed the different Canadian railways on this matter, and they have expressed their willingness to meet the lumbermen and discuss the proposed change.

MINDEN.

ACCIDENT.—Last week Alex. Morin, while working on one of Mr. J. M. Irwin's drives in Redstone Creek, met with a painful accident. Morin was attempting to wade through the creek and almost reached the bank, when a saw log came rushing along, striking Morin on the leg, breaking the bone between the ankle and knee, and knocking him over into the stream. One of his comrades, Paul Le Tait, nobly rushed to his rescue, and at great risk to himself managed to get Morin ashore. The poor fellow had to be sent out to Haliburton, a distance of eighteen miles, nine miles of which he had to be carried by men through the rough woods, no easy task when we mention that Morin weighs 230 pounds. However, they managed to get him safely to Haliburton, where the new doctor set the leg and he is now doing as well as can be expected. Now comes the part that shows the kind of stuff the river men are made off. The superintendent, G. S. Thompson, the next day headed a subscription list for the poor fellow and the boys made up the handsome sum of $125.—*Echo.*

A Carriage for New Zealand.

A carriage manufacturer in Montreal, who took first prize for his vehicles at the exhibition at Auckland, New Zealand, in 1877, has just executed a Queen's platform phæton to the order of Mrs. Samuel Morrin, of Auckland. The carriage, which presents a most elegant appearance, is built of the best possible materials, and the workmanship is first-class. The frame is of second growth ash, the panels whitewood, and the wheels of second growth hickory. The body which is supported on four springs, has a prominent English splash board and a seat behind for a footman. The dhæton is fitted both with shafts and a pole, and so can be driven either by a single horse or pair. When seen at the Antipodes it will no doubt stimulate more orders.

GILMOUR & Co. are pushing ahead their planing mill at Trenton. They have about completed a very large burner to consume all the blocks and shavings that may accumulate in their planing mill. It is a very large and formidable structure. They have the railway bridge accross the dam nearly completed and the washout has been cribbed up.

A "Pointer."

When Col. Sellers gives you a "pointer" in stocks, my friend, leave them severely alone, but when your own feelings tell you that you have palpitation of the heart, asthma, bronchitis or catarrh which unless checked are apt to run into consumption, heed the admonition before it is too late. All the diseases enumerated, and others, arise from impure blood. Put the liver in action, the largest gland in the human body, and you will speedily regain your lost health, and your bad feeling will disappear. Dr. Pierce's "Golden Medical Discovery" will accomplish the work speedily and certainly. Of your druggist.

Health is Wealth!

Dr. E. C. West's Nerve and Brain Treatment guaranteed specific for Hysteria. Dizziness Convulsions, Fits, Nervous Neuralgia, Headache, Nervous Prostration caused by the use of alcohol or tobacco, Wakefulness. Mental Depression, Softening of the Brain resulting in Insanity, and leading to misery, decay and death, Premature Old Age. One box will cure recent cases. Each box contains one month's treatment. One dollar a box, or six boxes for five dollars; sent by mail prepaid on receipt of price. We guarantee six boxes to cure any case. With each bottle received by us for six boxes, accompanied with five dollars, we will send the purchaser our written guarantee to refund the money if the treatment does not effect a cure. Guarantees issued only by J. D. TULLY, Druggist, Sole Agent for Peterborough.

HAGYARD'S YELLOW OIL CURES RHEUMATISM

FREEMAN'S WORM POWDERS.

Are pleasant to take. Contain their own Purgative. Is a safe, sure, and *effectual destroyer of worms* in Children or Adults.

WEST'S WORLD'S WONDER or family liniment has proved to be one of the greatest blessings of the age. It is a never failing remedy for rheumatism, cuts, sprains and bruises. Call on J. D. Tullyf or a trial bottle and you will use no other

Perhaps the most extraordinary that success has been achieved in modern science has been attained by the Dixon treatment for Catarrh Out of 2,000 patients treated during the past six months, fully ninety per cent. have been cured of this stubborn malady. This is none the less startling when it is remembered that not five per cent. of the patients presenting themselves to the regular practitioner are benefitted, while the patent medicines and other advertised cures never record a cure at all. Starting with the claim now generally believed by the most scientific men that the disease is due to the presence of living parasites in the tissues, Mr. Dixon at once adapted his cure to their extermination; this accomplished the Catarrh is practically cured, and the permanency is unquestioned, as cures effected by him four years ago are cures still. No one else has ever attempted to cure Catarrh in this manner, and no other treatment has ever cured Catarrh. The application of the remedy is simple and can be done at home, and the present season of the year is the most favorable for a speedy and permanent cure, the majority of cases being cured at one treatment. Sufferers should correspond with Messrs. A. H. DIXON & SON, 305 King street west, Toronto, Canada, and enclose a stamp for their treatise on Catarrh.—*Montreal Star* 1y122.

Timber Limits

AND

50,000 SAW LOGS

ON SEVERN RIVER

The undersigned being desirous of confining their operations to their Lakefield Mills on the Trent waters, offer for sale the following limits:—

Township of Hindou, 70 square miles.
" Oakley, 45 " "
" Redout, 22 " "

An area of 137 square miles.

These limits are estimated to contain 180 million feet of Logs, well watered, and afford means of short hauling from all points, and quick and cheap driving to Georgian Bay. Are offered for sale together with plant, depots, farms, 1,200 acres deeded lands and 50,000 logs, nearly all of which are on the main river, a large proportion of which are 16 feet long. Apply to

R. & G. Strickland,

All communications, orders and remittances should be addressed and made payable to THE PETERBOROUGH REVIEW PRINTING AND PUBLISHING COMPANY (LIMITED), Peterborough, Ont.

Communications intended for insertion in the CANADA LUMBERMAN, must be accompanied by the name of the writer, not necessarily for publication, but as a guarantee of good faith. Communications to insure insertion (if accepted) in the following number, should be in the hands of the publishers a week before the date of the next issue.

Advertisements intended for insertion in any particular issue should reach the office of publication at least four clear days before the day of publication, to insure insertion.

The CANADA LUMBERMAN is filed at the Offices of MESSRS SAMUEL DEACON & Co., 154 Leadenhall Street, London, England, who also receive advertisements and subscriptions for this paper.

PETERBOROUGH, Ont., JULY 1, 1886.

SOME FIGURES.

THE *Lumberman's Gazette*, of Bay City, Mich., thought the Canadian Government did wrong to increase the export duty on logs, and in two issues rung the changes on that chord. It seems, however, to have received new light on the subject from the Montreal *Herald*, and now thinks, like the immortal Mr. Toots, that it is "of no consequence," because the United States purchasers of the Georgian Bay limits did not intend to export in the rough much of their timber. Well, if these Michigan lumbermen did not intend to carry the logs over, what harm can the export duty do them? They can still saw the logs here and take over the lumber by paying the tax exacted by their own Government, the same as the Canadian dealers do.

The figures quoted from the Trade and Navigation Returns by the Montreal *Herald*, to show that very little timber had been exported in the rough, gives the *Gazette* considerable satisfaction, and it proceeds to say that one Saginaw firm only intended to export logs, and only 12,000,000 feet, and Alpena people probably 12,000,000 more. The *Gazette*, however, mentions in another place a firm that will export 3,000,000 feet, and there are probably more that it has overlooked. These figures give a total of 27,000,000, while according to the Trade Returns, quoted by the Montreal paper, the export of logs last year from the whole Dominion only amounted to 47,829 feet, and of this only about 300 feet was pine from Ontario! There is a vast difference between 300 feet and even 27,000,000 feet, and as the Montreal *Herald's* opinion was based on last year's published returns, its argument is a very foolish one, even in the light of the figures furnished by the *Gazette*.

To place the matter in as plain a light as possible, let us use the *Gazette's* figures for an illustration. Here are 27,000,000 feet of lumber to be exported in the rough, and on this the United States dealers would have to pay (supposing it is all pine), according to last year's tariff rate, $27,000, while the Canadian who exported the same quantity of sawn lumber to the United States would, by the laws of that country, have to pay $54,000. According to the present tariff rates, since the Canadian export duty was increased to $2, the United States and the Canadian dealers would pay, in duties, exactly the same sum, and the Canadians would not be placed at a disadvantage. The increase only removed the Canadian dealers' disadvantage, and "levelled up" the duties to put all on the same footing. That ought to be plain enough, and appears perfectly fair—neither dishonest, unnecessary or silly.

The import duty, we might add for the information of the *Gazette*, is $2 on pine and $1 on spruce, not $3 and $2, as it states.

THE MORRISON BILL.

THE introduction of the Morrison Bill in the United States Congress and the raising of the duty on logs exported from this country have kept the minds of lumbermen fixed on the question of tariffs for some time. The latter question—the export duty—was settled in accordance, as we believe, with the best interests of the Canadian lumbermen and of Canada, but the former has been disposed of, for the present, in a way that will continue the discussion of the question.

The Morrison Bill has been brought up in the House of Representatives, a motion having been made by its promoter that the Bill be considered, but the House decided, by a majority of fifteen, to refuse consideration of the Bill. It was announced that another effort would be made to have it brought before the House, but the indications now are that it has been definitely disposed of, so far as the present session is concerned, and very probably the vote taken will not be reversed by the present Congress.

The action of the United States Senate on the proposal to appoint a Commission to consider the fisheries and trades relations with Canada showed the temper of that House, the proposition having been voted down, and the action of the House of Representatives on the Morrison Bill seems to make it plain that neither of the Houses of Congress is prepared to go far, if any distance at all, in the direction of modifying the restrictions placed upon trade between this country and the Republic. This is to be regretted, and it is to be hoped that, as some have argued, the refusal to consider the Morrison bill when the proposal was made does not show a decided hostility to the measure itself, but only a refusal to consider it at that time. Still there is, so far as we have seen, very little to base such a conclusion upon, and the plain fact remains that consideration of the measure was refused for no other apparent reason than because the majority of the members were opposed to its provisions.

The fate of the Morrison bill demonstrates the wisdom of the Canadian Parliament in increasing the export duty on boys, because it would indeed be folly to allow the United States lumberman to carry our logs across the water and use their product to compete with our manufacturers, while they at the same time handicapped the Canadians by compelling them to pay a tax on all the sawn lumber they carried across the lakes to sell. When the United States shows a disposition to enter into arrangements for better trade relations between the two countries Canada should be ready to meet them, but in the meantime the United States should not be allowed to monopolize all the advantages that tariffs can give.

SOUTH AUSTRALIAN FORESTS.

The good work in progress at Bundaleer and Wirrabara is being repeated in other parts of the colony, and there are altogether some twenty reserves for forest purposes which are being planted and improved. The timber which these reserves will yield in the course of comparatively few years will repay the State handsomely for the outlay incurred. Nor shall we have to go far to find a customer for the timber, as our own railways and other public works will absorb it. Sleepers will have to be renewed, fences repaired and replaced, and wharfs and jetties constructed, and if in course of time the whole of the material for these works can be supplied by our own forests we shall have shown to the world that we have spent our money wisely, while at the same time we shall have found employment for our laboring classes in felling and preparing the timber for use instead of having to import it. We trust that notwithstanding the grave necessity which exists for care and prudence in the management of every department in the public service, a sufficient sum of money will be placed at the disposal of the Woods and Forests Department for next year, so as to enable the authorities to carry on the work with vigor and success. The cry is now for reproductive public works, and surely the planting of our forest reserves comes most emphatically within that definition. What will an acre of gum or pine trees be worth in 20 years? An acre of waste land would probably be worth £5 at the outside, but if it be covered with well-developed timber trees the value of the land will be enormously improved. Judicious planting will not only add to the beauty of the landscape, but it has the utilitarian advantage of increasing the humidity of the climate. We are saddling posterity with a large debt, the interest and principal of which those who come after us will have to pay, and if we leave to posterity well-timbered forests, instead of bare plain or gnarled and stunted bush, we shall leave a legacy by means of which our successors can pay that debt more easily. It is almost certain that as the forests of Western Australia and Tasmania become denuded of their natural growth of trees the value of timber will rise considerably. By planting largely now we shall make preparation for that time, and in course of years be able to supply all our needs in this respect. But the work must be done systematically and with judgment, and the colony is fortunate in having at the head of its forest department a gentleman of Mr. Brown's ability and enthusiasm. His work speaks for itself. Notwithstanding the exceptionally dry season through which we have passed some 90 per cent. of the trees planted out are growing. It is pleasing indeed to contrast the bare plain and brown hillsides of Bundaleer with the planted portion of the reserve, with its vigorous growth of gums and pines covering hundreds of acres, and so full of healthy life that one can almost fancy he can see them grow. If all this can be done, why is not more of it done? A number of the unemployed could be occupied throughout the winter and spring months in planting our forest reserves. If, taking advantage of the dull times, we could plant another thousand of forest trees this winter, it would be a work for which the laboring classes would thank us and posterity would bless us.—*South Australia Advertiser.*

AN EXPORT DUTY ON SAW LOGS.

The Montreal *Journal of Commerce* says:—In the House of Commons this week the most important business of a commercial character transacted was that connected with the increase of the port duty on saw logs from $1. as heretofore, to $3 per thousand feet. The *Journal* was, we believe, the first to bring forward (in an article on "Our Timber Supply," in December 1885,) the duty of the Government in respect to this matter. The article gave rise to wide-spread discussion among technical journals in Canada and the United States, but the unanimous disapproval it met with in Michigan and other lumber producing states, was perhaps as convincing an argument of the prudence of the course with respect to Canadian interests as could be looked for.

Considerable anxiety has been expressed as to the possible effect of such a duty on the action of the United States legislature, and we believe representations have been made to our Government that it may lead to a retaliatory action fatal to the interests of Canadian lumbermen. We are, however, of the opinion that the danger is imaginary. In the first place, that there is a very strong party in the United States which favors free lumber is abundantly clear from the strong support the Morrison Bill received. This party would present a vigorous opposition to any increase in the duty for any cause whatever, and obviously with much greater effect than they had when endeavoring to secure its repeal. The defensive is a much stronger position than the offensive.

In the next place the advocates of free lumber would in this case be reinforced by the western lumbermen and other American citizens who have bought Canadian limits. However much they may object to a policy which practically forces them to build mills and manufacture lumber in Canada, they would have no desire to have this prospect made additionally burdensome by a duty on the lumber they make, which would destroy their profits; or on the other hand to hold the limits idle in the hope that a retaliatory policy may force the hand of the Canadian authorities.

As far as we can gather any nervousness as to the result of an increased export duty on logs is mainly confined to the lumbermen on the Georgian Bay, who are brought into direct competition with those of Michigan, and naturally feel most keenly their strenuous and powerful opposition. The lumbermen on the Ottawa, knowing the strength of the eastern markets for Canadian lumber, and perhaps not taking into account sufficiently the opposition from so far of a quarter, has no fear of the results.

"The eastern people want our lumber, and must have it," is their view of the case, and they are prepared to wait philosophically the course of events. They are, however, generally disposed to support a duty of $2 per thousand feet, the rate imposed on our lumber when shipped to the States.

We are still of the opinion we have from the first expressed, that our forests should be so used as to assist in developing our own country, and to that end that the raw material therefrom should be worked up to the farthest point in the mills and factories of Canada.

It is bad enough to see our rough lumber exported to Burlington and Whitehall, and there give employment to vast numbers in resawing, dressing, manufacturing the same into doors, sashes and such articles before being distributed to the consumers in the eastern states, but it would be ten times worse to see our valuable forests stripped to feed the mills and stimulate the industries of foreign cities. We are glad the government has had the courage to take hold of the difficulty with a good grasp. Let us hold our own until the States give free admission not only to our rough product but to all classes of dressed and manufactured lumber. There is no reason, save the discrimination of the United States tariff, that our exports of the "product of the forest" to the United States should not be nearly double what they are now, and that, not by further depleting our forest reserves, but by working up into a higher product, by skilled labor, the raw material we now send out.

A BENEFIT EITHER WAY.

American owners of timber limits in Canada acquired them with the intention of taking over the logs and manufacturing them in Michigan. The increase of the export duty to $2 per thousand feet makes this design difficult of execution. It is probable that some logs will be taken over, in which case the Canadian treasury will get the benefit of the extra duty; and some mills may be erected by Americans on Canadian streams, by which the manufacture of lumber here will be extended. Owners of Canadian limits, residents on the other side, are reported to be about to try both experiments. One of these limit holders has sold at a good profit. The future state of the American market for lumber will probably determine whether logs will hereafter be shipped to the States in large quantities or manufactured here. Meanwhile there seems to be a disposition to prepare for both contingencies; and if expensive mills be once put up in Canada, the motive to work them, while any profit can be made, will keep them in operation.—*Monetary Times.*

A CONSIDERABLE number of logs are now being brought over the Midland Division of the G. T. R, says the Port Hope *Times*. There are to-day thirty cars lying on the sidings near the old car factory; some of the sticks are very large, a number measuring over 3 feet in diameter at the butt.

AT the New York Real Estate Echange last Thursday, 92,000 acres of timbered lands in Herkimer and Hamilton counties, New York, were offered at $250 an acre.

RAISING OAK TREES.

During the last few years large quantities of acorns have been taken from this country for the purpose of planting. White oak acorns are preferred, and they have been chiefly obtained in the State of Missouri. They are generally planted on sandy or broken land that is intended for pasturing sheep. In Great Britain sheep are accustomed to eat acorns, and it is considered profitable to raise them for sheep food. No variety of oak has received much attention at the hands of the planters of fruit trees. They state that the trees make a very slow growth, and for this reason they prefer to plant trees that grow rapidly and furnish timber and fuel in a short time. A foreign writer suggests that oaks may be raised to excellent advantage in connection with other varieties of trees that grow rapidly. He admits that oaks grow slowly while they are young, but states that they increase in size rapidly when they are 15 to 20 years old. He, therefore, recommends planting a row of oaks between rows of quick growing trees. The latter will be large enough to use for various purposes when they are from 15 to 20 years old. If care is exercised they may be cut down so as not to injure the young oaks. These trees being removed, the young oaks will grow rapidly and completely occupy the ground. Oaks are easy to propagate, as the acorns can be obtained at small cost and are almost certain to germinate Acorns are much easier to manage than large nuts like those on the pecan or hickery. They can be planted where it is desired to have them grow or in nursery rows, from which the small trees may be taken up when they are at a suitable size to be transplanted. The wood is excellant for fuel, timber and post.—[*Ex.*

POINTED OPINIONS.

A New York lumber dealer, who has often expressed— sometimes very forcibly, too—his opinion that there is "no inspection," no authorized inspection of lumber in the New York market, said to us yesterday: "Isn't it a strange state of things here when the inspection in hardwood lumber of one man only—Patrick Moore—will be accepted? What we want is uniform inspection under the control of a lumber exchange, and the sooner we have both the better for the New York lumber trade. If we had a lumber exchange in the metropolis, with authorized licensed inspectors, Chicago, Boston and other lumber centres would no doubt join in one uniform system of inspection that everybody would recognize, and which would obviate much of the present annoyance.

"A lumber dealer in Cincinnati wrote me the other day asking me what I could get for firsts and seconds in walnut in New York. I couldn't answer him for the reason that I had no idea more than the man in the moon what I could get. Firsts and seconds out west might mean 20 per cent. first and 80 per cent seconds, or vice versa.

"Now, if there was a universal, recognized inspection and standard of prices for grades of lumber, a man in Cincinnati would know what the prices of a certain kind of lumber would be in New York What we ought to have at once is a lumber exchange to regulate grading, inspection and prices."—*New York Lumberman.*

LIABILITIES OF HOT AIR AND STEAM.

The subject of the spontaneous combustion of wood has been discussed at various times by the French Academy of Sciences. Among the most interesting statements made on these occasions is that by M. Cosson, describing an accident which occurred in his laboratory, it appearing that, while he was working in his laboratory, a portion of the boarding of the floor spontaneously took fire; the boards were in the vicinity of an air hole, fed with warm air from a stove about thirteen feet away on the floor below. A similar accident had occurred two years previously, and, in consequence, M. Cosson had the boards adjoining the airhole replaced by a slab of marble. The boards which subsequently ignited adjoined the marble, and though the heat to which the boards were subjected was very moderate, being only that of air at 77° F., still the boards slowly carbonized, and, being thus rendered extremely porous, a rapid absorption of the oxygen of the atmosphere had resulted, and sufficient heat was thus produced to originate combustion. A similar instance of spontaneous fire is said to have occurred at Passy, a few days before, due to the action of the warmth from the airhole of a stove upon the woodwork, thus showing the danger liable to arise from this source, and the necessity of attention to the same on the part of builders.

DRUM MAKING.

Of a total of 200,000 drums made in the United States last year, it is said that 178,000 were manufactured in Granville, Mass. The old fashioned drum with wooden barrel, which was formerly the only kind in the market, is being rapidly supplanted by the neater and lighter model with a tin barrel. For the manufacture of the latter tin of various colors is employed, blue and red predominating, though the larger quantity of tin drums are made of a brass imitation. This tin comes in sheets of two sizes, 14x20 inches and 20x28, the sheets being packed in cases holding 112. For wooden drums the barrels are generally bass or white wood, occasionally oak. The stay hoops are of oak or beech. Before the strip of wood can be used, it needs to undergo many processes, among others bending, planing and sweating. The first drums made used to be boiled in open tanks, and the limit that could thus be prepared daily was less than 50. The introduction of machinery and more perfect methods has increased the daily productions, so that 2,000 drum pieces is considered nothing more than one man's fair day's work. The log, usually cut to three feet in length, is placed between the teeth of a huge machine, and the slicing begins. The knife receives it, and, as the log revolves, the piece sliced is received on a cylinder and then rolled up. Seventy-five thicknesses make one inch of the log. If then the log is three feet through, one revolution will yield a piece nine feet long, and the total length sliced from the log would extend over a mile. Cutting machines further reduces this huge sheet to the desired lengths. A core of six inches thickness is left, which is taken out of the jaws and split into drumsticks and tenpins. The veneers are heated, then bent, and are soon ready to be shaped as a drum. There are also planing and sandpapering machines, all run by water power. The strips are put through the bender, from three to six at a time. The sticks are smoothed by rolling in revolving barrels, the process being continued for three or four hours.—*Exchange.*

A NORTHERN MARKET FOR SOUTHERN LUMBER.

There is a growing opinion among the yard dealers in this city that more attention must, in the near future, be devoted to the cultivation of a trade in southern lumber. It is a recognized probability that the pine trade will be more and more cut into, until competition will become so sharp that old time profits will be impossible. While the pine trade of this city, both local and shipping, will make this the leading market for that kind of lumber as long as the supply holds out, the increasing use of other woods and the diversification of the lumber business generally suggest that it is unwise for dealers to shut their eyes to the growing demand for southern lumber, to the degree of letting St. Louis, Kansas City and other markets "get away" with the lion's share of the business. Men with a vision beyond the bounds of their pine yards see that southern pine, cyprus and poplar are bound to come into use in this city and surrounding towns in an increasing degree, and that somebody will reap such advantage of handling these woods as there may be in the operation. The demand will increase, and it will be met. Will the pine dealers ignore the innovation, or will they endeavor to seize it and make it redound to their advantage? Some of the dealers are answering the latter part of the query in the affirmative. They hold that, as this is a railway centre of greater magnitude than any other in the country, as well as the most important lake port in the northwest, and has acquired the prestige of the greatest lumber market in the world, it is a natural conclusion that Chicago should become an important distributing point for southern lumber. In taking this view, it is not considered that the far western demand is to be supplied from this point. But the local, suburban and near-by trade—say within a radius of 150 miles—can be furnished from this market at a profit.

The common objection to a shipping trade in southern lumber at this point has been that surrounding towns can be supplied directly from the mills. It is claimed that country yard dealers can get rates from the south as low as the wholesale handlers in this city can. This may be so, and yet there is more to the consideration than this simple fact. It takes money, facilities and experience to handle lumber. It also requires missionary work to induce dealers and consumers to take hold of a kind of lumber to which they are not accustomed. The manufacturers at the south sometimes need laboring with, also. Now the lumbermen of this city have the requisite capital to buy up and handle all the lumber produced in Arkansas, Louisiana, Mississippi and Alabama, if they could see profit in the undertaking. If they could find a field for distributing a large amount of southern lumber they would go into the business without delay. Or, if they could buy lumber at the south in large quantity—by the entire mill cut—at prices low enough to admit of a handling bill and a profit besides, some of them would venture to undertake it. But there must be a partial cessation of the peddling business now practiced by the southern manufacturers before the wholesale dealers of this city will be able to take hold of yellow pine, cyprus and poplar on a large scale.

If a system could be perfected whereby the dealers of this city could control the cut of numerous southern mills, a large amount of lumber could thus be profitably handled through this market. Were owners of mills at the south to be guaranteed the sale of their product for the entire season, knowing that it was going into competent hands, and that there would be no backset or failure in payment, they would sell lumber at rates that would give the northern buyer something of a monopoly of the business. The owners of mills at the south are not generally so rich that they would prefer to peddle out lumber by the car load, to retail dealers and consumers all over the country, when they could dispose of an entire season's cut at a fair log run figure.

This proposition it seems to men who have seriously thought of the subject, is the basis on which a southern lumber market can be built up in this city. Carried out, it would involve a more careful and specific manufacture, that would satisfy the northern demand. It would be necessary to conduct the business so that a full supply of southern lumber could be carried in stock.

As the white pine supply diminishes, and gets more and more into strong hands, the use of southern woods will increase. Already they cut a large figure in eastern seaboard markets. Time will come when the east will be largely supplied over interior railroads.—*Northwestern Lumberman.*

OVER WORKED Women

For "worn-out," "run-down," debilitated school teachers, milliners, seamstresses, housekeepers, and over-worked women generally, Dr. Pierce's Favorite Prescription is the best of all restorative tonics. It is not a "Cure-all," but admirably fulfills a singleness of purpose, being a most potent Specific for all those Chronic Weaknesses and Diseases peculiar to women. It is a powerful, general as well as uterine, tonic and nervine, and imparts vigor and strength to the whole system. It promptly cures weakness of stomach, indigestion, bloating, weak back, nervous prostration, debility and sleeplessness, in either sex. Favorite Prescription is sold by druggists under our *positive guarantee*. See wrapper around bottle. **Price $1.00, or six bottles for $5.00.**

A large treatise on Diseases of Women, profusely illustrated with colored plates and numerous wood-cuts, sent for 10 cents in stamps. Address, WORLD'S DISPENSARY MEDICAL ASSOCIATION, 663 Main Street, Buffalo, N. Y.

SICK HEADACHE, Bilious Headache, and Constipation, promptly cured by Dr. Pierce's Pellets. 25c. a vial, by druggists.

THE

SECURITY

MUTUAL

Benefit Society

OF NEW YORK,

No. 233 Broadway, New York.

The Security Mutual Benefit Society of New York is one of the few assessment life insurance companies that has attained conspicuous success. "Slow and Sure" has been the motto of its managers, and they have preferred to build up a solid foundation with

Strictly Frst-Class Male Risks,

rather than grow fast numerically at the expense of safety and become burdened with unsafe risks, heavy mortality and frequent assessments.

The members of this society elect their own officers annually, cannot be assessed except for death losses occurring after the surplus fund is exhausted, are guaranteed against dishonest management by the Agency Security and Guaranty Company, a responsible corporation organized upon the unlimited plan, and having one hundred thousand dollars capital, and who also

GUARANTEE THE PERPETUITY OF THE SOCIETY FOR 48 YEARS.

Considering the elements of safety and permanency which it affords, no organization ever before offered the substantial benefits of life insurance at so little cost to the insured.

ONLY TWELVE ASSESSMENTS

have been levied from 1881 to 1886, averaging three a year, and making the cost for assessments to a man of 40 years

Less Than Five Dollars a Year

for each $1,000 of insurance.

A LIMIT TO PINE VALUE.

A large owner of pine in the Aroostook region of Maine lately complained that the upper grades of lumber were selling at prices $2 to $3 below prices that prevailed when he purchased his holdings in the Aroostook country in 1851. This reduction in price has been brought about mostly because of an increase of transportation facilities and the cheapening of freight rates, whereby western pine has crowded Maine lumber in the eastern seaboard markets.

This statement of the Aroostook lumberman leads to a reflection of some importance. It is a fact that the increase of demand and the diminution of supply have not served to enhance the price of either high or low grade white pine lumber. It is a curious circumstance that today the druggy classes of lumber are the clears and selects. This is fact, notwithstanding that it is generally acknowledged that good lumber, as compared to coarse, is growing scarce and hard to be obtained in large proportion to the common and coarse qualities. Wide lumber, either coarse or fine, is now of more importance than strictly fine lumber that is not wide. Wide lumber will sell for a relatively higher price than any other of whatever grade or class.

The Maine man's experience suggests the probability that the value of white pine lumber will not advance with the ratio of diminishment of the supply. There are holders of pine stumpage who seem to think that the day will come when soft pine will be worth about as much as mahogany, certainly as much as black walnut, simply because of its scarcity. But there is no reason for such a conclusion. Probably there were men in Maine 20 or 35 years ago, who thought their good pine would by this time sell for $75 to $100 a thousand, because firsts and seconds sold in 1851 for $45 and $35 a thousand. They argued that in fifteen or twenty years pine would be a scarce article in Maine, and hence holders would be able to realize almost any price they should choose to ask for it. They made no calculation for the influx of pine from the west, even from far Wisconsin, of cypress poplar and yellow pine from the south, and the extensive adoption of hardwood in house finishing and other work, wherein soft pine was once deemed indispensable. So, to-day, it is likely, holders of Michigan and Wisconsin pine think that in fifteen or twenty years the supply will have become so nearly exhausted that they can realize cabinet-wood prices for their trees. But such sanguine owners are likely to be disappointed. Causes like those that have prevented the Aroostook men from doubling up the value of their holdings are operating to hinder the rapid advancement of the value of western pine. When the price of any wood in ordinary use is pushed up to a certain point, it strikes opposition to further advance in the shape of other woods that are brought in to take the place of the vaulting aspirant. When white pine became too costly in the east for ordinary purposes—and in the west, too, for that matter—yellow poplar entered the field for box-making, furniture work, etc. In house finishing the hardwoods have largely taken the place of white pine. Maple and yellow pine flooring are as cheap as a fair article of white pine and much better in the long run.

Thus no wood, however excellent it may be, can monopolise the market, or command a value above a range determined by competition with other woods.

Hereafter transportation facilities between the south and the north, and between the Pacific coast and the interior, will increase, thereby cheapening freight rates, so that the vast supplies of yellow pine, poplar, cypress, redwood, fir, cedar, and the various deciduous lumber-producing woods will be growing competitors of northern pine. It is to be doubted if white pine will be worth more twenty years from now than it is to-day. Choice sections of stumpage may enhance somewhat in value, but it will not do to venture too much on that even. The tendency is towards the cheapening of all sorts of commodities, and there is no reason to suppose that this general law will not apply to lumber.—*Northwestern Lumberman.*

THE COLONIAL EXHIBITION.

From the Canadian *Gazette*, London, England, of June 3rd, we take the following in reference to the Colonial Exhibition :—

Among the visitors at the Canadian section during the past week have been the Princess Louise and Princess Victoria. In company with the Marquis of Lorne their Royal Highnesses made an inspection of the educational court, and spent some time in examining the various exhibits of school work from the Province of Quebec, and in conversation, in the French language with the honorable Gedeon Ouimet, Superintendent of Public Instruction for the Province.

Some foreign visitors have also put in an appearance. Among these, Mr. V. E. Maar, lecturer at the Royal Danish Agricultural College of Copenhagen, spent some time in the section. His attention was particularly attracted by the agricultural trophy, and he expressed himself as specially struck with the fruits there displayed.

The Queen has been pleased to extend her recent purchases in the Canadian section. The latest recipient of the royal patronage are Messrs. La Liberte, of Quebec, from whom Her Majesty has secured a valuable otter muff. The royal party were evidently much impressed during their visit with the fur exhibits forming part of Canada's display.

Attentions are being showered from every quarter upon Canadian with other Colonial visitors who are here in connection with the exhibition. On Saturday, by invitation of the Secretary of State for the Colonies, a number of seats were placed at the disposal of Canadian visitors in the Colonial Office stand for the purpose of viewing the customary trooping of colours in celebration of the Queen's birthday. The Peninsular and Oriental Steam Navigation Company with their wonted liberality invited, through the Exhibition Reception Committee, a large company of colonists, and among them many Canadians, to a luncheon at the Royal Albert Docks yesterday (Wednesday), the party being conveyed by special steamer from the Temple pier. The proprietors of the *Times* newspaper have also, through the Reception Committee, issued invitations to a small party of Canadians to inspect their machinery and works on Friday next.

The Queen's birthday banquet of Canadian exhibitors on Saturday, was in itself entirely successful, thanks to the caterers and to the distinguished speakers. The speeches were all more or less in good form. The Marquis of Lorne makes an excellent chairman on such occasions, and surrounded by the faces of so many he had known in Canada, it was but natural that he should be appreciative and even humorous in his various utterances. Sir Chas. Tupper, in proposing "The Chairman," made a brief but happily impressive and businesslike speech. The Hon. G. Ouimet spoke in French, to the apparent appreciation of many Canadian guests, while Sir Saul Samuel, as Agent General for New South Wales, was able to strike a chord of sympathic feeling through the whole assembly by his timely reference to the Canadian Pacific Railway as a route to Australia, and to the projected cable from Canada's Pacific shore to the antipodes.

The visitors to the exhibition last week numbered 160,170, making the large total of 545,281 since the opening on May 4th.

At the levee held by the Prince of Wales on Monday the following Canadians connected with the exhibition were presented to His Royal Highness by Sir Philip Cunliffe-Owens, Secretary to the Royal Commission:—The Hon. Hector Fabre, Dr. Alfred R. C. Selwyn, the Hon. Gedeon Ouimet, Lieutenant-Colonel Thomas Ross, Mr. Thomas Cross, Dr. J. P. May, and Major Gartshore.

FORESTRY.

Did the prairie regions of the North-West form no part of the Dominion, Canada might with general accuracy be said to consist originally of one vast natural forest. Even now, indeed, one may find it so described without any material qualification in some English works reputed to be of standard merit, for until quite recently not a few learned geographers treated of Canada in their writings as little more than a fringe of habitable land along the shores of the St. Lawrence and the great lakes. But while the busy woodsman and hardy settler have together turned much of this original forest into arable and pasture land, the timber regions are still vast and varied enough to maintain for them a leading place among the feeders of Canadian industries. Hence, under the guidance of such experts as Professor Macoun, the woods of the Dominion form a prominent and interesting section of the South Kensington display worthy of the most careful attention.

THE WOODS OF THE PACIFIC PROVINCE.

In the very middle of the Central Gallery stands the already famous trophy of British Columbian pines. Erected to a height of some 10 to 12 feet the trophy consists of highly polished sections of the noted Douglas fir or Oregon pine of British Columbia. A fine collection of this same wood, the king of all trees, is to be found in the annexe to the south of the central gallery, leading from the game trophy. Here the immense polished sections average from 4 to 10 feet in length and as much as six feet in diameter. The finish of these samples serves admirably to show the beautiful grain and colour of the wood. They also permit of illustration of the facility with which the wood may be worked and of its inherent strength. So tough, indeed, is this Douglas pine that it was chosen for the structure of all the high bridges of the Canada Pacific Railway through the mountains. In the Machinery-in-Motion Court may be found an unpolished perpendicular section of the same wood, 15 feet high, which, though not taken from the centre of the tree, measures some seven feet in diameter, and this section is reported to have been taken from a tree twenty feet from the ground. The palm must, however be accorded to a truly immense horizontal section, in five parts, which is shortly to form the principal feature in a wood and coal trophy, in the outside space partly occupied by the Ontario windmills. It exceeds in size even the famous section on the Parliament grounds at Ottawa, for while that measures eight feet four inches in diameter, these five sections when put together represent a total diameter of over ten feet, the bark alone measuring ten inches in depth. In the Agricultural Court the woods of the Pacific Province are also well represented. As we have already seen, the base of the central pillar of the agricultural trophy is faced with polished slabs of no less than twenty-five of the species found in British Columbia, among which the beatifully grained red cedar must claim special admiration. Here a new feature adds much to the interest of the collection. On each polished panel a photograph shows the tree as it is met with in the forest, while the frame in which the photograph is encased is itself of the variety depicted, to indicate the wood in one of its manufactured stages. These species are not, it must be remembered, intended to show the full size, or, indeed, the entire beauties of the mighty trees of the Pacific Province, growing as they do in unhindered grandeur to twelve or thirteen feet in diameter, and nearly 300 feet in height. They merely illustrate the various species as near their natural state as possible, and this, it must be admitted, they do most admirably.

THE NEW BRUNSWICK TROPHY.

One of the most attractive features of the whole Canadian display is the New Brunswick wood trophy, occupying a prominent position on the south aisle of the central gallery. In other of the colonial sections—in the New Zealand and Australian for instance—will be seen large wood collections, but is doubtful if one equally compact and yet so completely representative is to be found in the whole exhibition. The main portion of the trophy is divided into three perpendicular sections. Along the base of three sections is arranged a series of fifteen uniform logs of commercial or large woods, each log being 37 inches in height and 20 inches in diameter. The right wing is devoted to the coniferous woods ; to the hemlock—one of the most important trees of the Province in connection with the tanning industry—the white and red pine, and the black and white spruce, representing the varieties chiefly used in shipbuilding. The centre and left sections are given up to the other large woods ; in the centre, the white and black birch, the scrub or rock and swamp maple, and the beech ; and in the left wing, the red and grey oak, the elm, black ash and basswood. Above this series of logs, in each of the three sections, an ash-wood case, resting on an inclined plane, contains as many as thirty small panels of the lesser woods, and also some of the larger woods, that are not abundant enough to be used for commercial purposes, or not sufficiently important to be represented in the principal parts of the trophy. The smaller woods thus represented include, in the right wing, the swamp and black alder, the mountain ash, bilberry, wild red and wild black cherry, wild thorn and scrub pine; in the centre section, the dwarf and grey birch, the mountain and white and striped maple, and the mooseberry and other duplicated varieties ; and in the left wing, the ironwood, dogwood, witch-hazel, willow, white ash, balsam, poplar, aspen poplar and sumach. Each small panel bears a life-like painting of the foliage, the flower, and often the fruit of its variety, and is framed with strips of its own wood showing the bark and growth. The beauty of these smaller woods is thus fully depicted, while a careful inspection will show how their usefulness may be extended for chemical and medicinal purposes, and also for ornamental trees.

Above the sloping case large upright panels indicate the large woods in polished sections, the principal varieties being the same as those shown in logs at the base. The sides of these large panels are formed of saplings of the respective woods, resting upon turned bases, and capped by capitals carved to represent the leaf, fruit and flowers of each variety. In these large panels the shaft and rift of the grain, as well as its density, annual growth, depth of sap and bark, are well shown, thus conveying, by the aid of the logs below, a complete idea of the natural growth of each of the larger woods. Their higher commercial use is also shown by oblique bars stained to show in turn the effect of ebony, walnut, mahogany, rosewood, satin-wood and other stains. The fruit, foliage, and flower are also beautifully painted upon many of the large panels, as upon the smaller ones, and above is carved some fancy work in each class of wood. The cornice surmounting the whole is composed principally of bark and specimens of each variety in mouldings. Above this main part of the trophy the principal animals of life of the Province is depicted in heads of moose, cariboo, and deer, as well as specimens of the porcupine, fox, racoon, mink, muskrat, ermine, the smallest species of American owl, flying and common red squirrel, raven woodpecker, partridge and other small game. To these it was intended to add specimens of the destroying insects of the forests, but time forbid. Indeed, though originally designed for the International Forestry Exhibition held in Edinburgh in 1884, the trophy was itself prepared in comparatively but a short time. Yet it shows few, if any, traces of hasty work, and must be admitted to be in every respect highly creditable to the New Brunswick Government, under whose auspices it has been erected, to the originators, Messrs. Howe, of St. John, New Brunswick, to Mr. Ira Cornwall, jr., agent for the Province at the Exhibition, and those other New Brunswick gentlemen who have actively interested themselves in the matter.

THE EAST AND CENTRAL FOREST ZONES.

The next feature of the forest display of Canada is the small trophy met with on the south portion of the Agricultural Court. It consists mainly of three shelves. On the two lower are arranged perpendicular slabs of the woods of Ontario, New Brunswick, Nova Scotia, and all Eastern Canada. These are, in a large measure, specimens in a different form of the varieties composing the New Brunswick wood trophy, for what applies to that Province will also apply to the whole eastern zone of the Dominion except that Western Quebec and Ontario possesses many species not found in the other provinces. On the upper shelf are arranged the slabs from a large number of the finest trees of the Rocky Mountain district, not, however, selected or intended to do more than show the ordinary product. Above this shelf is a horizontal section of the British Columbia oak, (Quercus Garryana), and above that again a roofing of Canadian shingle and a Canadian

hawk. The small size of this trophy has not, unfortunately, permitted the display upon it of the photograph of each varity, as is being done in the case of the British Columbia samples and the photographs of the growths of Eastern Canada must, therefore, be placed elsewhere, though an interesting feature will be added in the specimens of the fruit to be shown in jars beside each variety. Close at hand, in the south annexe to the Agricultural Court, the woods of Quebec and the Lake Superior region are adequately represented. On the one side of the annexe, large logs of the tree are shown, while on the other side the cut wood is represented. And here activity prevails, for it is largely from the deals of Eastern Canada that rustic seats are now being made for the use of visitors to the Canadian section. The seats will bear inscriptions, showing the place of growth, and thus form an excellent exhibit in themselves. From Thunder Bay eleven species of woods are shown as specimens of the timber used in connection with the gold and silver mining industries. These include the white, Norway, and jack pines, spruce, tamarac, white birch, and white poplar.

The central forest district of Canada is also represented in connection with the agricultural exhibits. Here may be seen the ash-leaved maple from the heart of the prairie, the close-grained red fir peculiar to the eastern side of the mountains, white spruce of the best quality, clear of knots, and capable of excellent seasoning without warping; cypress pine, with, in some respects, the appearance of bird's-eye maple, as well as white and black birch, red and white pine, spruce, poplar, tamarac, oak, balsam and balm of Gilead. The woods of the country north of the prairie—that is in the forest regions of the North-West—are of the first quality. The black and white spruce are found in abundance, as well as the two species of poplar and pine. In the mountain section of the North-West there are eleven species of timber trees, most of which are of large size, producing the best of timber. These same varieties are also represented on the British Columbia side of the mountains, and many of them reach even to the coast.

VANCOUVER.

In an extended notice of Vancouver, B. C., the terminus of the Canadian Pacific Railway, the San Francisco *Journal of Commerce* says:

As the lumber resources of the Province are practically inexhaustible, its manufacture and shipment forms of the chief industries carried on at present about Vancouver.

HASTINGS' SAW MILL.

This mill is located in what is now the city of Vancouver, and was founded as far back as 1864. It is under the direction and management of Mr. Richard H. Alexander, who is one of the most enterprising and prominent men of this new city. The mill has three engines and six boilers, employs 150 hands, all departments included, and has a capacity for turning out 70,000 feet of lumber per day of 12 hours. Though they supply a good share of the local demand, their business consists chiefly in shipping, the product of the mill going principally to Australia, China and South America. A vessel is at present being despatched to London loaded with spars and clear lumber. A specialty is made of large timber. Some time since a flagstaff was got out for the Indian and Colonial exhibition, held in London, which was 148 feet long and only 16 inches at the butt end. A sawn piece of timber, 28x28 inches, 110 feet long, was shipped to China, which was the cause of a somewhat singular order; a request coming for a piece for use in building a summer palace for the Emperor of China, to be sawn five feet square and 60 feet long. They had seen such heavy productions coming from the mill, they imagined any size could be obtained. The mill would not back down, but offered to produce the stick if they would find the means to ship it.

ROYAL CITY PLANING MILL COMPANY.

This firm, who have large mills in New Westminister, where they turn out all kinds of lumber, wood finishing, turning, etc., established themselves in Vancouver last fall. They have constructed a wharf 600 feet long with a frontage of 76 feet, on which are piled large quantities of lumber, laths, shingles, etc., which is brought here on scows from the New Westminister mill. They are putting up a mill here which will be in working order by the middle of May, and will have a capacity for turning out 50,000 feet per day of 12 hours. They supply at present in Vancouver about 30 hands; in New Westminister, 100. Their business here, owing to the amount of building going on, is very large, averaging 25,000 feet per day. Mr. John Hendry is general manager, and Mr. R. C. Ferguson manager in Vancouver.

SPRUCE DEALS.

The business of St. John, N. B. in the manufacture of spruce deals for the British, runs up into the hundred or more millions feet each year, enormous steamers and ships being employed in the freighting of the manufactured lumber. Sometimes half a dozen large-sized steamers may be seen in St. John harbor at one time, loading deals for the English market. Spruce deals are selling just now at unusually low prices in St. John, only fetching $8.50 per thousand feet, while logs cut on Canada soil are selling at $7.50 per thousand feet, delivered at the mills in St. John. It is difficult for the outsider to see where the profit, if any, is realized in such a business. The lumber manufacturers claim to secure quite a margin in the scale of the logs they buy. There are so scaled as to saw out 1,100 feet or so to the thousand. The average cut of sawing deals at St. John is $1 per thousand feet.

Of course deals are not always so low as at the present. There is the ever-present hope of a rise, which leads many a lumberman to a fruitless dance in the uncertain chase for profits. American logs, those cut in the state of Maine and floated down the waters of the St. John to the mills, sell at $9.50 per thousand feet. Many of these are sawed at St. John in mills controlled by Americans, and shipped to Boston and New York for a market. Thus 600,000 feet of the spruce lumber used in the construction of the new Washington mills at Lawrence comes from St. John, N. B. Driving, rafting and booming the millions of feet of logs cut on the St. John waters gives employment to thousands of men. All logs so cut are stopped at the great booms at Fredericton. Then they sorted, rafted and taken in tow for the mills at St. John, at an expense of $1.80 per thousand feet inclusive of all charges.— *Manufacturer's Gazette.*

FOREST FIRES.

PEMBROKE, Ont., June 10.—Two weeks ago some Poles set fires in the vicinity of Pogue Lake, and the high winds that prevailed since that time have carried the fire down to Brennan's Creek, a distance of over ten miles, the breadth of the burnt district being over three miles. Mohr's limit suffered most, the fire totally destroying it. McLachlin Bros.' limit caught in several places, burning all the provisions the men had for the drive. The fire is now under control. Constables have gone in search of the parties who set out the fires. On Saturday during the high wind the barns and outbuildings on the farm of Mr. Stephen Ryan, Reeve of South Algoma, took fire from the bush and were totally destroyed. A number of settlers in South Algoma and Hagarty have had their fences and crops burned. On Saturday evening they had a good shower of rain, and only for this a good deal more damage would have been done. The Polish settlers were removing their furniture and effects from their houses and burying them, but the timely rain saved their buildings. A Russian Pole was arrested on the instance of McLachlin Bros., and brought before Justices Kinders and O'Grady, charged with setting fire to their limits, and was committed to jail for thirty days.

M. FOREN'S workshop in Belleville was seriously damaged by fire on June 18th, and a quantity of his lumber burned. A shed adjoining owned by G. S. Tickell, was also burned. Mr. Foren's loss is $600; insured in the Royal for $600. Mr. Tickell's loss is $120. The Ashley carriage factory was also damaged to the extent of about $50.

THE

Gutta Percha & Rubber Mfg. Co'y

T. McILROY, Jr., Manager.

MAIN OFFICES and WAREHOUSE at the Factories, 135 to 155 West Lodge Avenue, P.O. Box 494. TORONTO

Market Reports.

TORONTO.

From Our Own Correspondent.

TORONTO, June 23.—No lumber of any consequence is now leaving our docks, nearly all the dry stuff is shipped out, and the new cut is all there is to depend upon for shipment, and but little of that is yet ready to move. The retail yards are all doing a brisk business, some of them, however, I fear, not doing a safe one. This, I think, is confined to two or three who deal heavily with speculative builders, which is risky. One of this class of contractors has just skipped out between the two lights, leaving some confiding dealers to mourn his dishonesty. This will continue to be the case to a greater or lesser extent, until such time as dealers demand undoubted security for their material before it is placed on the ground, and in justice to themselves and their creditors, they have a right to do this.

Sales from the car for local demand continue fair. Most of the bill stuff coming in is this season's cut, and cars have to be loaded with due regard to the eye of the weigh master, so that until the new cut is partially dry business must be done by the middlemen at a small profit. Wholesale dealers have made such vigorous opposition to the R R. Companys' unjust demand for 25 per cent. penalty on all excess weights, that the Companys have come to the conclusion that discretion was the better part to take, so that demand has been abandoned, though not without a good deal of squirming. There is still another unjust practice adopted by the Grand Trunk Railway, which should at once be rectified, and that is as follows:—any lumber firm bringing lumber from any given point on their road, say that four cars are shipped from the same place and at the same time. Three of said cars weigh less than 24,000 lbs., and one over that weight. Instead of striking an average, the three cars are charged at 24,000 lbs., and the fourth one is billed to the consignee with the excess weight. To give the N. & N. W. R. Co'y their just due, let me say they do not follow this course and a large corporation like the former should be above such petty larceny. There is really no other fit name to apply to it.

The quantity of lumber unloaded by track side has lessened somewhat during the last month, and all dimension stuff arriving by rail moves off readily, although prices are not high enough to give the dealers a fair living profit.

MONTREAL.

From Our Own Correspondent.

Montreal, 26th June.—During the early part of the last fortnight, unfavorable weather considerably interfered with the local lumber trade, and consequently retarded the distribution, but latterly it has been fine and business has been more active. Generally speaking, the trade done during June is considerably in excess of that done in the corresponding portion of last year. There is a large stock of lumber on hand here, but not an excess, as there is a good demand, and as building operations are being still actively carried on, it is likely to continue so for some time.

The demand for car loads has been good, and some large lines have been profitably disposed of, although some sales of a less satisfactory nature are spoken of. Large quantities of lumber are being daily received per Lachine Canal, from the Ottawa district. Up to date, 354,000 pieces deals, 17,500 ends and 38,600 boards have been exported to Europe, and 951,000 feet to South America.

The following are the quotations at the yards:—

CARGO LOTS—MICHIGAN INSPECTION.

Three uppers	$42 00@44 00
Common	18 00@24 00
Culls	10 00@18 00

CHICAGO.

The *Northwestern Lumberman* of June 26th says:—

BY THE CARGO.

Over 200 cargoes of lumber have arrived in port during the week. The daily offerings on the market have been ample for the requirements of trade. The larger proportion of incoming lumber is green piece stuff. It has sold with fair readiness, and prices have not materially differed from those that prevailed during the week previous. The price of short green dimension is still placed at $9, though that is all the market will bear. The appearance of thing indicates a perturbation of the market bottom, though the commission men are hanging on like grim death. On Thursday business seemed rather slow, and holders manifested some anxiety to close trades. While it is not within the open truth to say at the moment that lumber is cheaper than it was a week ago, the tendency is certainly not to strength. It is predicted that if the wind holds northerly, and the cargoes continue to come along as fast as they are now dropping in, there must be another decline of a quarter on a thousand.

There is considerable indefinite talk about the present market value of No. 2 boards and strips. This term now applies to lumber comprehended in a wide range. So many ports now send lumber to this market that it is almost impossible to say what is and what is not strictly No. 2 stock. The only way is to give a sufficientiy wide range to prices for green and dry as to include all that can be classed as No. 2. This we endeavor to do in this issue. Sales have lately been made of stock that was classed as No. 2 at $10, $10 25, $10 75 and $12 a thousand, the latter being for strictly dry. This season, however, most of the inch lumber being absorbed by the yards has been bought at the mills to arrive, and, of course, on private terms.

Shingles are still somewhat slow of sale, and prices are weak at our quoted range.

AT THE YARDS.

For a week past only a fair demand has prevailed. There begins to be some complaint of dullness, though it was to be expected that there would be a falling off in distribution as midsummer approached. Since the labor troubles in May subsided, a large requirement has prevailed in this state and dealers who cultivate this trade have made no complaint of lack of demand.

Receipts of lumber and shingles for the week ending June 24, as reported by the Lumberman's Exchange:—

GLASGOW.

The *Timber Trades Journal*, of June 12th says:—The past week's import list, it will be observed, includes further arrivals of Canadian deals here per steam liners. No auction sale at time of writing has yet taken place, at which the newly-landed deals have been offered, but there will be one to note for next issue. Other imports of Glasgow have been American oak planks and Austrian wainscot billets and planks, the bulk of which are sold ex-quay, and parcels of staves from New York.

The imports of staves from the States to the Clyde amount this year at date to 305,000 pieces, as against 350,000 pieces for corresponding period last year. The stock in yard is moderate. Pipe staves not inquired for. There is further to note in the past week's arrivals an import of American poplar or whitewood logs, of which the market was bare. They have the N. T. B. mark (imported by the Scottish Carolina Timber and Land Company), and are yarded for sale at Queen's Dock.

At Greenock the only arrival to note is a cargo of teak, consigned to Messrs. Edmiston & Mitchells.

Imports of north of Europe goods to Grangemouth are much under those of corresponding period last year, the carrying tonnage for the current year to date amounting to 5,600 tons as against 17,600 tons at this time last year.

Particulars are appended of a public sale of timber held at Greenock on 3rd inst. A portion of the catalogue—the goods saved from the wreck of the *Benefactress*—was exposed without reserve.

A large company was present, and in the aggregate a considerable quantity of goods changed hands.

AUCTION SALE.

On 3rd inst., at Greenock, Messrs. Edmiston & Mitchells, brokers:—

(Sold without reserve on account of underwriters):—

	Per cub. ft. s. d.
Quebec waney boardwood—

Sawn pitch pine—	
35 c ft avg per log	1 0

LIVERPOOL.

The *Timber Trades Journal*, of June 12th, says:—A good criterion of the present state of trade here may be found in the report of the public sale given below.

Notwithstanding the effort to push business, because those in whose hands the goods are, have a great desire to get them sold before the holidays, nothing, or next to nothing in the shape of business is being done during the whole of Whit-week.

On Wednesday, the 9th inst., Messrs. A. F. & D. Mackay offered for sale by auction, at their public salerooms, 10, Canada Dock, two cargoes of sawn pitch pine timber and deals, one entire cargo of spruce deals of last season's import, part of a cargo of deals now landing, and part of one now about due, both from St.

John's, N. B., two parcels of pine deals, in addition to sundry lots of birch timber and planks, waney board pine, oak, etc., so that the catalogue lacked nothing in the way of variety.
